Despite the adjustments to EPA label estimates, the "shortfall" or "gap" between the EPA label estimates of new car fuel economy and what real people achieve in their day-to-day driving continued to be a topic of interest to the public and the media (e.g., O'Dell, 2012). Some media organizations conduct their own tests on public roads in order to compare "real-world" estimates to the EPA's label estimates. *Consumer Reports*, for example, has made such comparisons for years. In a 2005 study, it concluded that fuel economy for conventional gasoline vehicles averaged 9% worse than label estimates, while hybrids were 18% below the label estimates (ConsumerReports.org, 2013). In 2008, the EPA (2006a) made further downward adjustments to label estimates. Consequently, a 2013 *Consumer Reports* study found conventional gasoline vehicles averaged only 2% below the EPA label estimates while hybrids fell short by 10%.

In developing the new 2008 fuel economy label estimates, the EPA analyzed several sources of on-road fuel economy estimates (EPA, 2013, Ch. 2). One was a sample of 8,180 estimates for 4,092 vehicles from users of the My MPG section of the DOE/EPA website www.fueleconomy.gov. For conventional gasoline vehicles, the My MPG data indicated that the label numbers based on the 1984 adjustment procedures were still reasonable estimates of average on-road fuel economy. For conventional gasoline vehicles the average label to on-road shortfall was only 1.4%. However, the shortfall for hybrid vehicles averaged 8.2%. As discussed below, these results closely match those obtained by Greene et al. (2007) in an analysis of a similar sample of the My MPG data.

The EPA, the Coordinating Research Council (CRC), the Department of Transportation (DOT), and the DOE measured the fuel economy of 120 vehicles, including 30 hybrid vehicles,

6 The combined fuel economy estimate is a weighted harmonic mean of the city and highway estimates, equal to 1/((0.55/city)+(0.45/highway)). The adjusted formula is 1/((0.55/(0.90*city))+(0.45/(0.78*highway))).

in the Kansas City region (EPA, 2006, Ch. 2). The vehicles were driven by their owners, and data were collected over a 24-hour period by means of portable emissions measurement systems. A zero-intercept regression line predicting on-road fuel economy as a function of the 1984 EPA fuel economy label estimate indicated that conventional gasoline vehicles would average about 0.6% higher fuel economy on the road than the label values suggested. For hybrids, however, an average shortfall of 11% was observed

The problem of achieving a consistent, proportional relationship between fuel economy as measured on laboratory tests relative to what drivers will experience in the real world is not limited to the U.S. Similar shortfalls between test cycle and on-road fuel economy have also been observed in China and much larger shortfalls have been reported for the EU. Two recent studies by the International Council on Clean Transportation (ICCT) found that the on-road to certification test shortfall for vehicles sold in the European Union (EU) has been increasing rapidly (Mock et al., 2014; Mock et al., 2013).

> "All data sets we examined demonstrate the same over-arching trend: the discrepancy between type-approval and real-world CO_2 emissions is increasing. While in 2001 this gap was just 8 percent, it grew to 18 percent by 2008 and then to 38 percent in 2013." (Mock et al., 2014, p. 43)

The ICCT analyses conclude that the increasing gap is most likely due to increasing use of technologies that perform better on the certification ("type approval") test than in the real world, increasing use of flexibilities in the testing procedures, and external factors not accounted for in the test, such as increased use of air conditioning. On the other hand, increased use of strategies to maximize test results are cited by Dings (2013) as the most important factor. Dings attributes approximately half of the gap to permitted techniques for optimizing performance on the EU's test procedures that do not correspond to benefits in actual use. He allocates the remaining 50% equally among factors omitted from the test (e.g., air conditioner use), differences between the test cycle and actual driving behavior and conditions, and unknown factors.

Like the data used in this study, the ICCT data came from self-selected samples or business fleets. Potential sources of bias are acknowledged and briefly discussed in the report. However, the ICCT studies assert that model-year trends in the on-road shortfall should be insensitive to the sample design provided that the design does not change across model years. Because of this, the fact that their sample is self-selected should not affect inferences about the increasing on-road shortfall. The ICCT report also points to the fact that the trends are relatively consistent across different data sources.

Also relying on self-reported data obtained from customers of a fuel economy website, Chinese researchers measured the shortfall between official Chinese government estimates and the reported on-road fuel consumption (Huo et al., 2011). For 2009, they found that on-road fuel consumption (gallons per mile) averaged 15.5% above the test cycle numbers. For the 153 makes and models in their data base, the range of increased on-road fuel consumption was from -8% to +60%.

This study uses the My MPG data of www.fueleconomy.gov to analyze the relationships between both test cycle and label fuel economy and what motorists say they achieve in their real world driving. The My MPG data have been analyzed three times before but with fewer samples and model years than are included in this analysis. Greene et al. (2006) regressed reported My MPG numbers against the EPA label estimates using the first 3,221 estimates supplied by customers of www.fueleconomy.gov. The EPA label estimates were based on the 1984 adjustment method since the study predated the 2008 adjustment method. The study found that the adjusted label estimates were nearly unbiased predictors of the average fuel economy of My MPG customers. On the other hand, the EPA label estimates were highly imprecise predictors of any given customer's MPG estimate. This led to the following conclusion.

> "These results imply that what is needed is not less biased adjustment factors for the EPA estimates but rather more precise methods of predicting the fuel economy individual consumers will achieve in their own driving." (p. 99)

Greene et al. (2006) also recomputed EPA label estimates for those customers who provided estimates of their percentages of city and highway driving. Using customer-specific city and highway MPG weightings reduced the mean standard error (MSE) of their model from 3.42 to 2.89, or by about 15%.

Lin and Greene (2011) analyzed 31,227 My MPG records using linear models and ordinary least squares (OLS) regression with robust error estimation. Their goal was to develop models that could more accurately predict a given individual's on-road fuel economy using data that could readily be supplied by the motorist. They found that accuracy rather than bias remained the chief limitation of the EPA label estimates, and that the bias of the 2008 adjustment method, relative to the My MPG numbers, was greater than that of the 1984 method. Their best model, however, was able to reduce the mean squared error (MSE) of prediction by only about one third versus the "naïve" prediction that on-road fuel economy equals EPA label fuel economy.

The ICCT's study of EU experience (Mock et al., 2013) includes a brief analysis of an earlier version of the My MPG data set used in this study. They concluded that the gap between U.S. test estimates and the on-road data was relatively steady at about 20% until model year 2003. After 2003, they found that the gap increased, reaching about 35 percent for model year 2012.

III. Data

Data for this study were obtained from the joint DOE/EPA website www.fueleconomy.gov . Since 2005, the website's My MPG section has offered its customers the opportunity to select their vehicles from its database, enter their own fuel economy estimates, compare their estimates with the official EPA label estimates, and share their estimates with other users of the website. The site accepts fuel economy estimates derived by any method, but it provides guidance on how to measure fuel economy and checks data entered for errors and plausibility (Goeltz et al., 2005). For those who want to create fuel purchase diaries, the site provides templates for entering odometer readings (or miles traveled), fuel quantities purchased, price paid, percentage

VW FOIA, EPA 06/20/2017 2017-FFP_027991

of city and highway driving, and date for any number of refueling events. Consistency checks are made as data are entered, and potential errors are brought to the customer's attention. Alternatively, customers may supply estimates based on their vehicles' dashboard readout, their own calculations, or by simply guessing.[7] The distribution of vehicle records in the My MPG database by type of estimation method is shown in Table 1.

Table 1. Distribution of My MPG Data by Participant's Method of Calculation

Method	Frequency	Percent
Vehicle's Computer Display (dash)	11,804	15.3
Miles & Fuel Purchase Diary (miles)	15,086	19.56
Odometer & Fuel Purchase Diary (odom)	15,854	20.56
Calculated by Own Method (math)	32,645	42.33
Guess	779	1.01
Other & Unknown	958	1.24
Total	77,126	

For estimates to be accepted, the customer must respond affirmatively to a return e-mail sent by the site, as a guard against spurious or repetitive entries. In order for customer-supplied estimates to be shown on fueleconomy.gov, they must pass validity tests. For this study, however, all e-mail validated data were accepted. Outlier detection was based on statistical criteria, as described below.

The My MPG data are susceptible to a variety of errors, including simple recording errors or calculation errors by those doing their own calculations. However, the website provides forms with built-in error checking for those entering odometer readings and fuel purchases at each fill up. MPG estimates based on long trips or summer driving tend to overestimate total annual fuel economy, while measurements taken under unfavorable conditions, such as towing or driving in congested traffic or on snowy winter roads, result in underestimates. The variance of the My MPG estimates around either of the EPA estimates is relatively large. On the other hand, the My MPG data may be the best source of information about motorists' beliefs about their vehicles' fuel economies.

Figure 1 shows My MPG data plotted against the EPA combined unadjusted test cycle fuel economy estimates. The unadjusted test cycle estimates are used to determine vehicle manufacturers' compliance with federal fuel economy and greenhouse gas emission regulations. Four different powertrain technologies are shown in different colors. Unfortunately, there is no information about how often owners of flexible fuel vehicles (FFVs) use E85 versus gasoline. In the figures below FFVs are compared to their fuel economies when using gasoline. In Figure 1

7 In 4,708 cases, estimates made by different methods were provided for the same vehicle. In the case of such repeated observations, each estimate was treated as a distinct observation, resulting in 77,126 total observations for the 72,211 vehicles.

the majority of the data points for every powertrain technology fall below the line on which test cycle = reported on-road MPG, reflecting the well-known bias of the test cycle estimates.

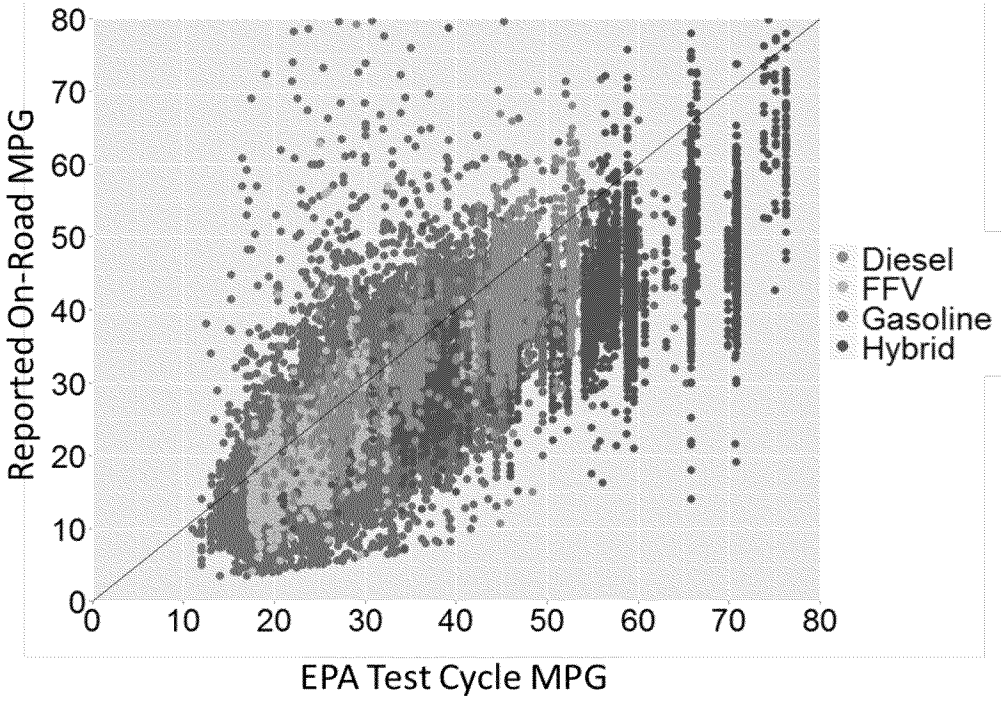

Figure 1. My MPG On-Road Estimates vs. EPA Test Cycle MPG Estimates for All Vehicle Types

Figure 2 shows My MPG data plotted against the current EPA label fuel economy estimate, which has been adjusted to better reflect average on-road fuel economy.[8] The adjusted label estimates are used to inform consumers in advertising and on the government website www.fueleconomy.gov. Bias is less evident in Figure 2, although for gasoline vehicles there appears to be a tendency for the label MPG to underestimate MPG at higher MPG values (most observations fall to the left of the line) and overestimate the reported on-road MPG at low MPG values (the majority of observations fall to the right of the line on which both values are equal and hence Label MPG > On-Road MPG). This tendency does not appear to apply to hybrid vehicles, however. Most estimates exceed the 2008 label MPG: 75% for gasoline vehicles, 93% for diesels and 60% for hybrids.

8 The 2008 adjustment method has been used for all model years, as implemented by www.fueleconomy.gov.

VW FOIA, EPA 06/20/2017 2017-FFP_027993

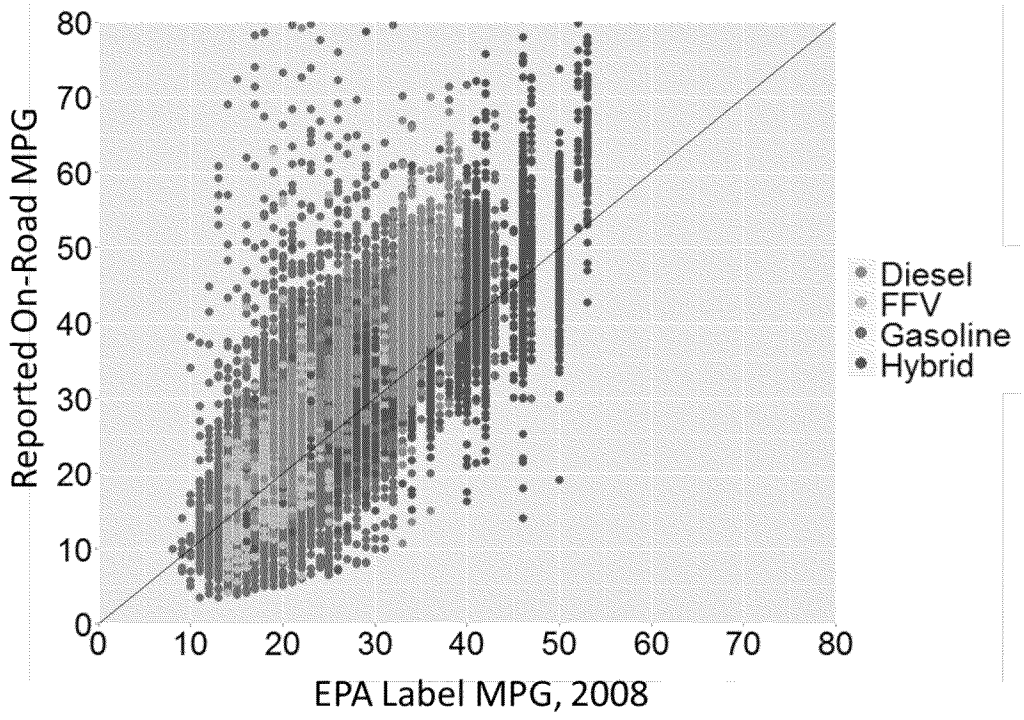

Figure 2. My MPG On-Road Estimates vs. EPA Label MPG Estimates for All Vehicle Types

The My MPG data have strengths and weaknesses. The large number of observations and detailed matches to the owners' vehicles by make, model, engine and transmission make this a unique publicly available source of information. There are observations from every state and for every model year of vehicle from 1984 to 2015. The information supplied by many participants about method of estimation and driving style enables additional inferences. A disadvantage of the My MPG data is that participants are a self-selected sample. While the distribution of the sample can be compared with other known distributions, there remains a potential for bias related to the participants' interest in fuel economy. The methods by which the data are provided by customers of www.fueleconomy.gov have not changed over time so that if there is a bias in the data it is likely to remain consistent over time.

While it is not possible to definitively establish bias or lack thereof, frequency distributions of the respondents give some indication of the representativeness of the sample. The distribution of respondents by type of vehicle is compared with model year sales by vehicle class from 2000 to 2014 (EPA, 2014b) in Table 2. Passenger cars appear to be over-represented in the My MPG sample and all types of light trucks somewhat under-represented.

VW FOIA, EPA 06/20/2017 2017-FFP_027994

Table 2. Distribution of Vehicles by Vehicle Class for 2000-2014 Model Years

New vehicles as a share of production				Shares in My MPG sample	
	Mean	Min	Max		
Car	52.7%	47.7%	60.5%	Car	67.56%
SUV	27.7%	18.9%	35.7%	SUV	17.72%
Pickup	13.4%	10.1%	16.1%	Pickup	10.42%
Minivan/Van	6.2%	3.8%	10.2%	Minivan/Van	4.30%

The My MPG sample also appears to be reasonably geographically representative. A simple correlation of the sample frequencies by state with the 2010 Census state population estimates produced a correlation coefficient of 0.971. The correlation with the Federal Highway Administration's state motor vehicle registration estimates for 2010 was similar, 0.976.[9]

One might suspect that individuals who would monitor their vehicles' fuel economy and submit data to www.fueleconomy.gov would be more likely than the average driver to maximize fuel economy. Although the distribution of driving styles in the general population is not known, the distribution of participants by self-described driving style does not reveal a predominance of eco-drivers. Only 17% of the participants described themselves as more cautious than most drivers and only 2% said they drive to maximize fuel economy (Table 3). Nevertheless, the potential for bias in a self-selected sample remains. As a consequence, the results of this analysis must be interpreted with caution.

Table 3. Distribution of My MPG Participants by Self-Reported Driving Style

Driving Style of Primary Driver	Count	% 1 to 5	% of Total
Drives for maximum gas mileage (1)	602	2.23	0.78
Drives more cautiously than most (2)	4,709	17.43	6.11
Drives with the flow (3)	7,024	25.99	9.11
Drives a little faster than most (4)	9,709	35.93	12.59
Accelerates quickly and passes whenever possible (5)	4,978	18.42	6.45
Not reported	50,104	-	64.96
Total	77,126		

Three measures of fuel economy are used in the analysis below (Table 4). The corresponding distributions (including log-transformed distributions) are shown in Figure 3. The "My MPG" numbers are those reported by individuals throughout the U.S. using www.fueleconomy.gov's My MPG system. MPG numbers adjusted by the EPA for use on vehicle window stickers and for public information are termed "EPA Label" estimates. "EPA Test Cycle" estimates are the

9 Table MV-1, Highway Statistics 2010, accessed on 3/18/2015 at, http://www.fhwa.dot.gov/policyinformation/statistics/2010/mv1.cfm.

VW FOIA, EPA 06/20/2017 2017-FFP_027995

unadjusted MPG estimates based on the EPA's city and highway cycle dynamometer tests. The test cycle estimates are used to certify manufacturers' compliance with fuel economy standards.

Table 4. Sample* Means of Three Fuel Economy Metrics

Fuel Economy Metric	Sample Mean	Std. Dev.
My MPG User Estimate	26.02	10.02
EPA Test Cycle Estimate	30.56	10.73
EPA Label Estimate	23.08	7.35

*Includes only gasoline, hybrid and diesel powertrains. Outliers deleted if My MPG > 150 or <2, or if more than 5 standard errors above or below regression line of My MPG on EPA Label Estimate. 76,755 observations remained in the sample.

Other variables describe vehicle attributes or represent fixed model year or state effects. The variable "cid" stands for cubic inch displacement but is actually a vehicle's engine size in cubic liters. Zero-one indicator variables include transmission type: "cvt" for continuously variable and "manual" for manual transmission. Transmissions with seven or more gears are designated by the variable "gears7", six or more by "gears6." Other indicator variables represent 4-wheel drive (fourwdr), all-wheel drive (allwdr), and front wheel drive (frontwdr). The categories of driving style are listed in Table 3, with the first five being represented by "style1" to "style5," consecutively. The methods by which participants estimated their fuel economies are represented by the (1,0) variables "dash," "miles," "odom" and "math," as shown in Table 1. The ten largest auto manufacturers are represented by (1,0) variables with the rest combined being the default. Model years 1984 to 2014 and the 50 states plus the District of Columbia are also represented by fixed effects, with 2015 and state not reported used as the default values.

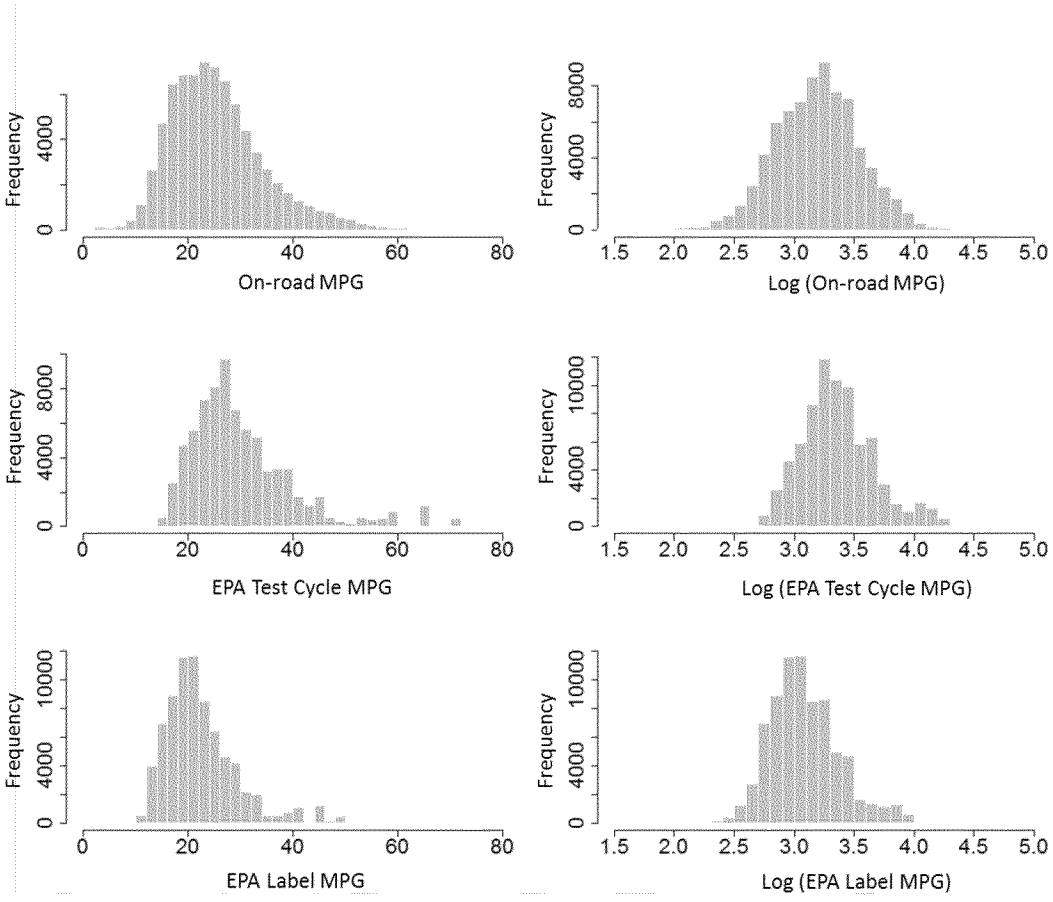

Figure 3 Distribution of My MPG, EPA Test Cycle and EPA Label estimates.

IV. Method

When estimating the relationships between MPG values measured on a dynamometer and those measured on the road, there are three reasons for preferring the log-log functional form. The first is that it treats fuel economy (miles per gallon) and fuel consumption (gallons per mile) symmetrically (log(mpg) = -log(gpm)). Estimated coefficients would have identical values and standard errors but opposite signs. Each coefficient represents the percent change in fuel economy for a 1% change in the respective variable. The second reason is that the effects of many of the factors influencing vehicle fuel consumption are multiplicative rather than additive. For example, the efficiency with which the chemical energy in fuel is converted into mechanical work at a vehicle's wheels is equal to the engine efficiency multiplied by the transmission efficiency, while the energy required to move a vehicle a given distance equals one over the drivetrain efficiency multiplied by the work that must be done to overcome aerodynamic drag, rolling resistance and inertia. The third reason, as will be shown below, is that the residuals from the log-log regression better approximate the more desirable properties of errors in regression models.

VW FOIA, EPA 06/20/2017 2017-FFP_027997

The general estimating equation is therefore,

Equation 1

$$\log\left(MyMPG_i\right) = \alpha + \beta \log\left(testcycleMPG_i\right) + \sum_{j=1}^{n} b_j x_{ij} + \varepsilon_i$$

The coefficient β in the general equation represents the percent change in on-road MPG for a 1% change in test cycle MPG, controlling for the n variables x_{ij}. Alpha (α) is a common constant term, ε_i is a driver/vehicle-specific random error, and *i* is the index for each vehicle in the My MPG database. When the x_{ij} are (0,1) indicator variables, e^{b_j} is the multiplicative effect of factor j on MPG. For example, if $b_j = -0.05$, then $e^{b_j} = 0.951$, implying that the effect of factor j is to reduce fuel economy by 4.9%.

The unconditional value of β is also of interest as a measure of the average U.S. relationship between on-road and test cycle MPG.

Equation 2

$$\log\left(MyMPG_i\right) = \alpha + \beta \log\left(testcycleMPG_i\right) + \varepsilon_i$$

Finally, the linear relationship between on-road MPG and the EPA estimates posted on new vehicles' window stickers and used in advertising is also of interest because it describes the correlation between the information provided to consumers and what consumers experience. Larrick and Soll (2008) found that consumers interpret fuel economy information linearly in terms of miles per gallon rather than in terms of gallons per mile. A linear formulation is therefore used in this regression.

Equation 3

$$MyMPG_i = \alpha + b\left(labelMPG_i\right) + \varepsilon_i$$

All the regressions in this report were carried out using the STATA® "regress" procedure, with the "robust" correction for heteroskedastic errors.[10] Outliers for gasoline and diesel vehicles were identified by first regressing the log of observed MPG on the log of the combined test cycle fuel economy and a constant. The estimated variance of the residuals from the regression was used to detect potential outliers. Upper and lower bounds for outlier detection were increased in integer multiples of the MSE of regression until there was no evident truncation

10 STATA® is a registered trademark of StataCorp LP (2015).

in the graphs of residuals. The mean squared error (MSE) of the regression is relatively large, reflecting the degree of variance evident in Figures 1 and 2. Because the residuals from the regression were skewed towards negative values, the upper boundary was set at +5 standard errors while the lower boundary was set at -6 standard errors from the combined adjusted EPA label MPG estimate. Errors are multiplicative in the logarithmic model, so a lower bound of -6*0.336 allows a fuel economy estimate 87% below the regression line while an upper bound of +5*0.336 sets a limit of 5.4 times the regression line value. These outlier limits rejected only 302 observations (0.45%) from the gasoline vehicle sample. The MSE of the diesel regression is smaller but still large relative to predicted fuel economy. Only 13 hybrid records and five diesel records were deleted as outliers. The outlier detection regression results for gasoline and diesel vehicles are shown in Table 5.

Table 5. Outlier Detection Regressions of My MPG on EPA Test Cycle Combined MPG Estimates

Variable	Estimate	Standard Error	Significance Level	Root MSE	R-squared	No. Obs.
Gasoline Vehicles						
Test MPG	0.9990	0.0053	0.000	0.3360	0.34	67,679
Constant	-0.1807	0.0178	0.000			
Hybrid Vehicles						
Test MPG	0.8956	0.0155	0.000	0.2696	0.37	5,044
Constant	0.0974	0.0608	0.109			
Diesel Vehicles						
Test MPG	0.9327	0.0199	0.000	0.2012	0.51	2,267
Constant	0.1516	0.0735	0.039			

Analysis of the residuals from all the regressions reported below using the Stata™ hettest post-estimation tool indicated that they were heteroskedastic ($p = 0.000$) and skewed towards negative values. Therefore, all regressions reported below were estimated using the Stata™ variance covariance estimation procedure for robust errors.

V. Results

The simple regression model of equation (2) was estimated to determine the average relationship between test cycle and on-road MPG for all model years of gasoline, hybrid and diesel vehicles in the sample. Model year indicator variables were then added to the gasoline vehicle regression to explore the possibility of trends in the relationship over time. Next equation (3) was estimated for each of the three types of powertrains to measure the relationship between the information provided to consumers and their own fuel economy estimates. Finally, the more general equation (1) was estimated separately for each powertrain types and then again for only those gasoline vehicles with odometer based estimates.

Test Cycle and On-Road MPG Estimates

Relationships between the logarithms of reported on-road MPG and the EPA test cycle MPG without controlling for other variables were estimated to describe the average "shortfall" for all model years and vehicles implied by the My MPG estimates. Results are summarized in Table 6. Test Cycle MPG is significant at the 0.001 level, although the R^2 values are only 0.56 to 0.68, indicating a large amount of unexplained variance.

Table 6. Log-Log Regression of My MPG Estimates on EPA Test Cycle MPG Estimates (selected variables reported)

Variable	Estimate	Standard Error	Significance Level	Root MSE	R-squared	No. Obs.
Gasoline Vehicles						
Test Cycle MPG	0.9964	0.0034	0.000	0.214	0.56	67,377
Constant	-0.1566	0.0114	0.000			
Hybrid Vehicles						
Test Cycle MPG	0.9252	0.0098	0.000	0.160	0.64	5,031
Constant	-0.0115	0.0393	0.799			
Diesel Vehicles						
Test Cycle MPG	0.9511	0.0160	0.000	0.143	0.68	2,262
Constant	0.0858	0.0605	0.156			

The coefficient of Test Cycle MPG in the gasoline regression, 0.996, indicates that a 1% increase in fuel economy on the test cycle translated, on average, into almost exactly a 1% increase in fuel economy on the road. The shortfall is determined by both coefficients. For gasoline vehicles, the estimated shortfall from EPA test cycle estimates to My MPG on-road fuel economy estimates is approximately -15%. This is virtually identical to the approximately 15% reduction specified by the EPA's 1984 adjustment procedure (Hellman and Murrell, 1984), but somewhat less than the 19% to 20% shortfalls found by Mintz et al. (1993). It is also less than the approximately 20% average adjustment stipulated by the 2008 rule (EPA, 2006).

The hybrid results imply a shortfall of about 22% at an EPA test cycle MPG of 25, increasing to 27% at an EPA test cycle MPG of 60. For diesels, the shortfall is only about 7% at an EPA test cycle MPG of 25 and grows to 10% for a vehicle with an EPA test cycle MPG of 50. Both hybrids and diesels have MSE smaller than the gasoline vehicles. Still, even for diesels, a 2*MSE band would be approximately -23% to +30% of the predicted value.

Shortfalls for each drivetrain technology are shown in Figure 4 as a function of EPA test cycle MPG. The estimates are based on the regression results shown in Table 6 and represent the average relationship between test cycle and on-road MPG over the 1984-2015 model years. No

VW FOIA, EPA 06/20/2017 2017-FFP_028000

model year effects or other variables were included in the regression. The estimated shortfalls for diesel and hybrid vehicles grow with increasing MPG, but the estimated shortfall for gasoline vehicles remains nearly constant at about 15% as MPG increases. Mathematically, this conclusion follows from the fact that the estimated coefficient of the logarithm of gasoline test cycle MPG is approximately 1.0 (0.9964). Early studies, in which carbureted gasoline engines predominated, indicated increasing shortfall with increasing MPG (e.g., McNutt et al., 1982).

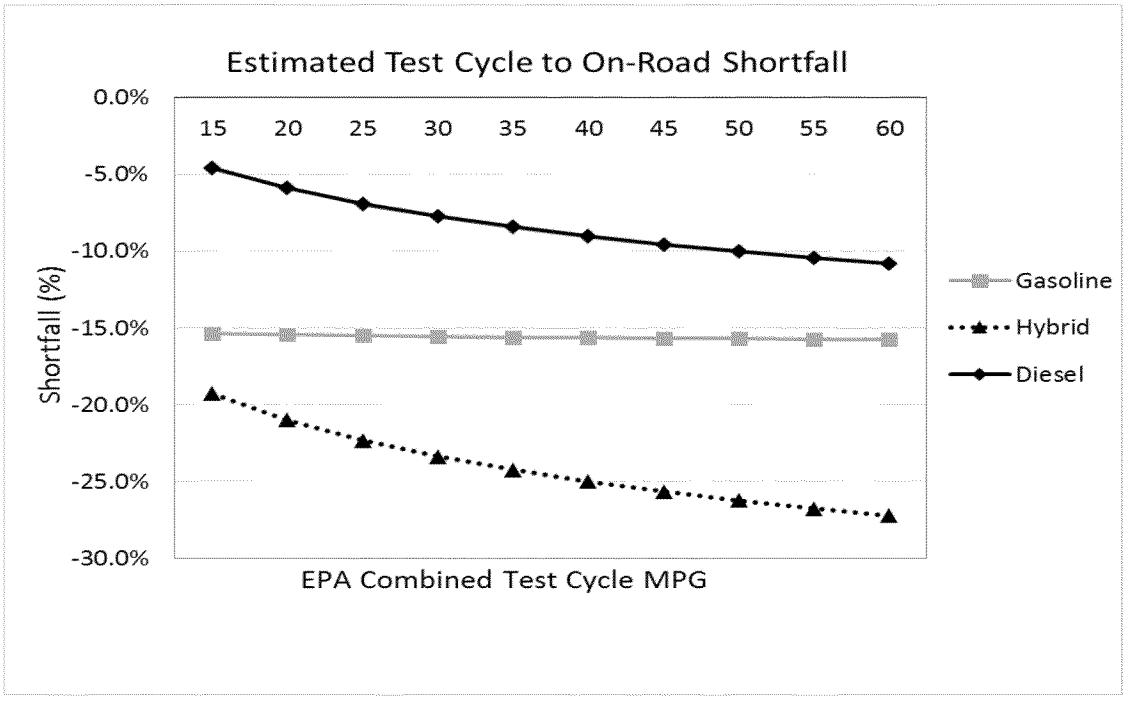

Figure 4. Estimated Shortfall as a Percentage of EPA Test Cycle MPG.

The My MPG data for gasoline vehicles indicates that the shortfall between on-road fuel economy and EPA test cycle estimates may have increased in recent years. A simple model was estimated that regressed the logarithm of My MPG versus the logarithm of EPA test cycle MPG, including model years 1984 to 2014 as indicator (0,1) variables. No other explanatory variables are included. An F-test indicated that the addition of the indicator variables was statistically significant at the 0.0001 level. The shortfall, Δ, is estimated as the ratio of the on-road MPG predicted by the model to the average test cycle MPG for light-duty vehicles reported by the EPA (2015, table 9.1) in the respective model year, minus 1. The MPG predicted by the model is the test cycle MPG raised to the power 1.042 (the coefficient of the log of test cycle MPG), multiplied by $e^{C+\delta_y}$, where C is the estimated constant term of the regression and δ_y is the estimated model year coefficient. Because the coefficient of the log of test cycle MPG is greater than 1.0, the shortfall is gradually reduced as MPG increases. The regression coefficients and related statistics can be found in the appendix.

The estimated fuel economy shortfalls for conventional gasoline vehicles by model year are shown as percent differences from the test cycle MPG in Figure 5. Upper and lower bounds based on the 95% confidence intervals of the model year coefficients are also shown. The estimated additional shortfall is very close to 15% from 1987 to at least 2006 and perhaps 2009.

VW FOIA, EPA 06/20/2017 2017-FFP_028001

In 2010 it dips close to 20%, declines to over 25% in 2013 and then rebounds to about 22% in 2014 and 2015. Although the shortfall appears to have increased abruptly in recent years it may be stabilizing close to the 20% shortfall used by the EPA and NHTSA to estimate future benefits of the fuel economy and GHG emissions standards. As noted above, studies carried out in the 1970s and 1980s estimated that the shortfall increased from 1974 to 1977 and then stabilized in the vicinity of 15% to 20%. The U.S. trend is much less extreme than comparable shortfall estimates for vehicles sold in the EU, described above (Mock et al., 2014).

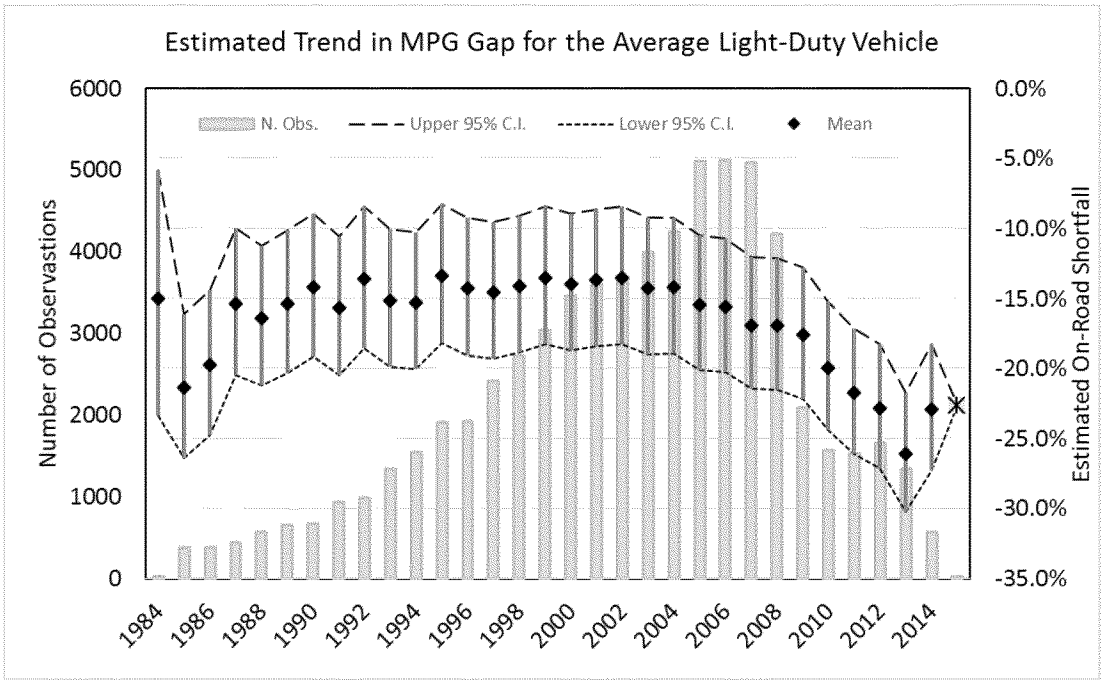

Figure 5. Estimated Fuel Economy Shortfall for Model Years 1984 to 2015.

Almost forty years ago, an apparent increase in shortfall followed the oil price shocks and gasoline shortages of 1973-74 and the adoption of the first fuel economy regulations in 1975. Similarly, the price of gasoline increased from about $2/gallon in 2004 to $3/gallon in 2008 and, after remaining nearly constant since 1985, the CAFE standards for light trucks were increased in 2005 and those for passenger cars in 2011. The timing of the increase in shortfall suggests the possibility that as standards are tightened (or gasoline prices increase) manufacturers increasingly design vehicles to perform well on the test cycle (and achieve higher label MPG), in the process increasing the gap between test cycle and on-road fuel economy. Blending of ethanol with gasoline approximately tripled between 2005 and 2011, at which point most gasoline contained approximately 10% ethanol by volume (EIA, 2015). Because ethanol has only 2/3 of the energy content of gasoline, this could increase the on-road shortfall by about 2%. The fuel economy estimates of recent model year vehicles would be based on fuel with approximately 10% ethanol while those of older model years would be more likely to be based on fuel with a lower ethanol content. Whether increasing gasoline prices or increasing fuel economy standards or ethanol use, or something else, caused the on-road gap to increase is an important topic for further investigation. Even more important is whether the gap will remain stable in the future, so that an increase in test cycle fuel economy continues to provide an equivalent percentage increase in on-road fuel economy. The apparent trend should be closely watched to insure that

VW FOIA, EPA 06/20/2017 2017-FFP_028002

the gap does not increase further. Light-duty vehicle fuel economy on the test cycle increased from 24.0 MPG in 2004 to 30.6 in 2014, about 28% (EPA, 2014b). If the shortfall increased by about 7 percentage points over the same period, about one fourth of the test cycle fuel economy gain over that period may have been offset by the increased shortfall. However, because the rulemaking calculated the benefits of the standards assuming a 20% shortfall, the implication for the projected benefits is very small provided that the gap does not continue to grow.

Label and On-Road MPG Estimates

To estimate the potential bias and variance of individual estimates around the label numbers, linear regressions of the My MPG values on only the combined adjusted (2008) EPA label values and a constant were estimated. These regressions describe the correlation between the information provided to consumers and their reported on-road MPG (Table 7).

Table 7. Linear Regressions of My MPG Estimates on EPA Combined Adjusted Label MPG Estimates (selected variables reported)

Variable	Estimate	Standard Error	Significance Level	Root MSE	R-squared	No. Obs.
Gasoline Vehicles						
Label MPG	1.1521	0.0042	0.000	5.097	0.56	67,377
Constant	-0.4568	0.0879	0.000			
Hybrid Vehicles						
Label MPG	1.0757	0.0128	0.000	6.607	0.60	5,031
Constant	-1.5189	0.4888	0.002			
Diesel Vehicles						
Label MPG	1.2519	0.0188	0.000	5.709	0.60	2,262
Constant	-0.5601	0.5787	0.333			

In the gasoline vehicle regression, the coefficient of EPA label MPG implies that the on-road MPG of My MPG participants averages about 13% better than the EPA label rating at 20 MPG and increasing to 14% better at 50 MPG. The hybrid regression results imply a smaller bias, ranging from +2.5% at 30 MPG to +5% at 60 MPG. Because the constant term is not statistically significant, for practical purposes it would be reasonable for hybrid buyers to assume that average on-road MPG will equal the EPA label MPG. However, that is true only with respect to the national average MPG. An individual's experience is likely to differ greatly from the national average, as indicated by the MSE of more than 6 MPG. Diesels average +22% above the label values at 20 MPG, increasing to 24% at 50 MPG.

The fact that the fuel economy achieved by individuals will differ from the label estimate has long been recognized. Indeed, a statement to that effect is printed on every fuel economy label. The My MPG data indicate that the differences are relatively large. For a conventional gasoline vehicle with a label fuel economy of 25 MPG, the regression results indicate that a confidence

VW FOIA, EPA 06/20/2017 2017-FFP_028003

bound of +/- 2*(root mean squared error) is +/- 40% of the label value. If a 25 MPG vehicle travels 10,000 miles per year and gasoline costs $2.50/gallon, the consumer can be 95% certain that its fuel costs will be somewhere between $600 and $1,400. Uncertainty of this magnitude can seriously hinder a consumer's ability to make informed choices about fuel economy (Greene, 2011; Greene et al., 2013).[11]

Factors Correlated with On-Road MPG

The following sections describe the results of an expanded regression analysis, including additional variables describing vehicle technologies and driver attributes, as shown in equation 1. As in equation 1, all the expanded models regress the My MPG estimates against the test cycle MPG estimates and other variables. Key results are highlighted in the following sections. Full listings of coefficient estimates and related model statistics for the regressions are provided in an appendix to the report.

Gasoline Internal Combustion Engine Vehicles

This section describes the results of the expanded regression on the subset of vehicles with conventional gasoline engines. Because test cycle fuel economy is one of the explanatory variables, the coefficients of the technology and driver variables do not measure their total impact on fuel economy but instead measure impacts on on-road fuel economy relative to the test cycle. A positive coefficient indicates that a technology increases on-road fuel economy relative to the typical on-road vs. test cycle relationship. A negative coefficient indicates on-road performance that is below average. For example, a technology that increased fuel economy by 5% on the test cycle but only 4% on the road would have a coefficient of about -0.01. The coefficient of -0.01 represents a 1 percentage point increase in the average shortfall, say from 15% to 16%.

When additional variables are included, the coefficient of test cycle fuel economy has a mean value of 0.74, with a 95% confidence interval of 0.72 to 0.76, indicating that a 1% increase in test cycle fuel economy corresponds to a 0.74% increase in on-road fuel economy, all else being equal. Other factors are not equal, however, and they have a substantial influence on on-road fuel economy. Vehicles with larger displacement engines do slightly worse on the road: a doubling of engine size reduces on-road performance by about 2.6% relative to the test cycle.[12] Vehicles with continuously variable transmissions (CVT) appear to get about the same miles per gallon on the road relative to their test values as vehicles with conventional transmissions. Manual transmissions do about 6.9% better than automatics in real world driving. Turbocharged engines are estimated to add about 1.7% to the on-road shortfall in comparison to naturally

11 An important, unanswered question is whether car buyers assume a high degree of correlation among fuel economy estimates for cars they are considering buying. This may depend on whether deviations from label fuel economy ratings are strongly correlated for vehicles owned by the same household. This issue is not analyzed in this report. Further analysis of the odometer and miles data are planned and may shed some light on this question.

12 All the results reported in this section have a level of statistical significance of 0.05 or better, except where noted otherwise. Detailed results may be found in the appendix.

aspirated engines. The shortfall for turbocharged pickups is about 6% larger, a result that is consistent with a recent study by AAA (2015) also based on the My MPG data. However there were a relatively small number (67) of turbocharged pickup trucks in the dataset. On the other hand, the 542 turbocharged SUVs in the dataset do not show a statistically significant increase in their on-road shortfall, suggesting that the pickup effect may be a result of differences in usage (e.g., towing and hauling). Vehicles with higher gear counts appear to have a somewhat reduced shortfall but this result has a significance level of only 0.094. Four-wheel drive performs about 1.8% worse on the road while front wheel drive does about 1.3% better. With the exception of manual transmissions, none of the technology impacts are greater than 3%, indicating that the test cycle results are not strongly biased relative to on-road performance by these technologies.

Driving style matters. The estimated coefficients are relative to the style of the majority of observations which do not include a description of driving style.[13] If the observations without an indication of driving style have driving styles similar to those that do, the driving style coefficients can be interpreted as differences from the typical driver. Drivers who described themselves as driving "for maximum fuel economy" or "more cautiously than most," reduced their on-road short-fall by about 12% in comparison to those who chose "accelerate quickly and pass whenever possible" and by 8-10% relative to the average driver. The benefit of the more cautious driving styles closely matches other estimates of what an average driver can achieve by "eco-driving" (Greene, 1986; Kurani et al., 2013; IEA, 2005; Kurani et al., 2005).

There are a few statistically significant effects associated with manufacturers, but they combine the unobserved effects of driver behavior and environment with the design and manufacture of the vehicles. In general, manufacturer effects are small. The estimated coefficients range from 2.7% to 5.1% decreases in on-road performance for Ford, Chrysler, Nissan and Hyundai vehicles to zero effects for GM, Honda, Toyota and Volkswagen, to 0.7% to 1.5% increases for BMW and Daimler. Again, it is not possible to attribute these effects to a vehicle's design and manufacture since they include unknown effects of behavior and environment.

Vehicle class effects (measured relative to compact cars) tend to be larger, with light trucks having greater shortfalls than passenger cars. The coefficients of minivans, SUVs, pickups, vans, and special purpose vehicles imply increased shortfalls of 6.4% to 11.5%, in comparison to compact passenger cars. Once again, the estimated effects cannot distinguish effects due to the way the vehicles are used (e.g., towing, hauling or off-road operation) from how they are designed.

In the expanded regression model the only model year effects significant at the 0.5 level are associated with the oldest two model years (1985, 1986) and model year 2013. Nonetheless, an F-test indicated that the model year effects, taken as a whole, are statistically significant at the 0.0001 level. The estimated effects for the oldest vehicles may reflect differences in usage patterns (e.g., shorter trips) and mechanical performance due to the age of the vehicles as much

13 The option to specify driving style was added in 2007 after the My MPG system had been in effect for several years. Thus, early participants did not have the opportunity to indicate their driving style.

VW FOIA, EPA 06/20/2017 2017-FFP_028005

as model year specific effects. In general, the data do not indicate a deterioration of on-road fuel economy performance with age over the typical 15-year lifespan of a light-duty vehicle (Figure 6). Although most year effects are not individually statistically significant, the pattern of the model year coefficients is similar to that in Figure 5 which suggests the possibility of an increasing shortfall in the more recent model years when fuel economy standards have been increasing (Figure 6). Because these coefficients are generally not close to being statistically significant, conclusions cannot be drawn about their meaning. Considered together with the model year effects described above, this result suggests that the apparent increase in shortfall shown in Figure 5 can be statistically explained in part by the additional technology, vehicle class, and other variables included in the expanded regression model.

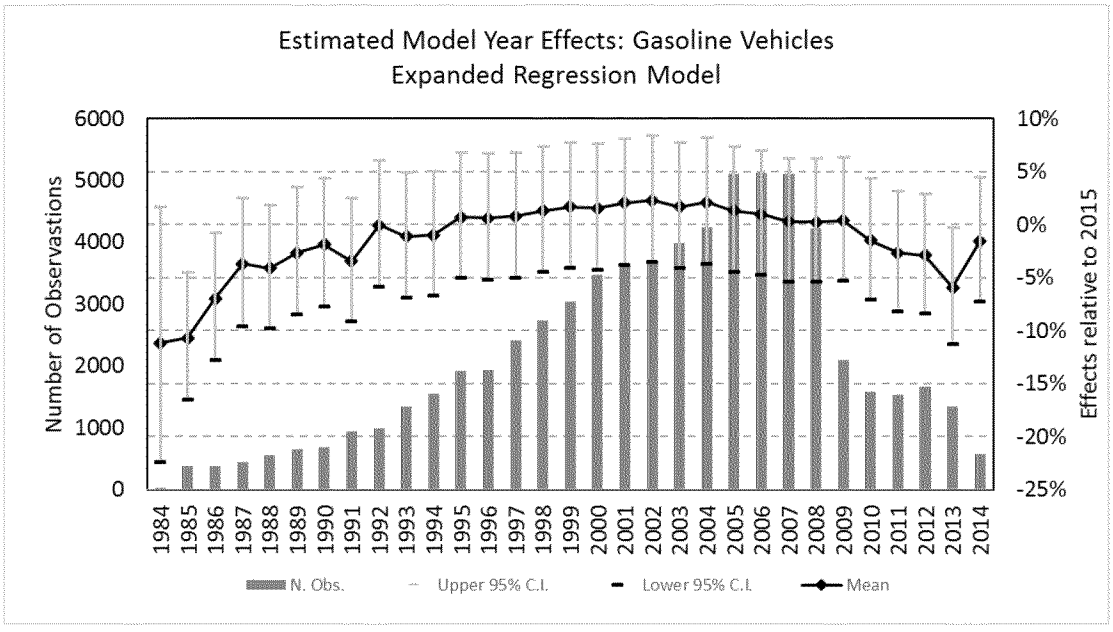

Figure 6. On-road Fuel Economy Performance Compared with Vehicles of 2015 Model Year

All but ten state effects are statistically significant at the 0.05 level. A positive state effect indicates that the shortfall in that state is less than the default shortfall. The default is no state specified, and nearly all states with statistically significant effects have effects that are greater than zero (CA, DC and HI are exceptions). The state effects represent a combination of impacts on fuel economy that vary geographically, including temperature, traffic congestion, speed and trip length. Because some factors reduce the on-road shortfall (e.g., longer trip lengths, mild temperatures) while others increase it (e.g., congested driving conditions, cold weather) it is difficult to discern consistent patterns in the state effects (Figure 7).

VW FOIA, EPA 06/20/2017 2017-FFP_028006

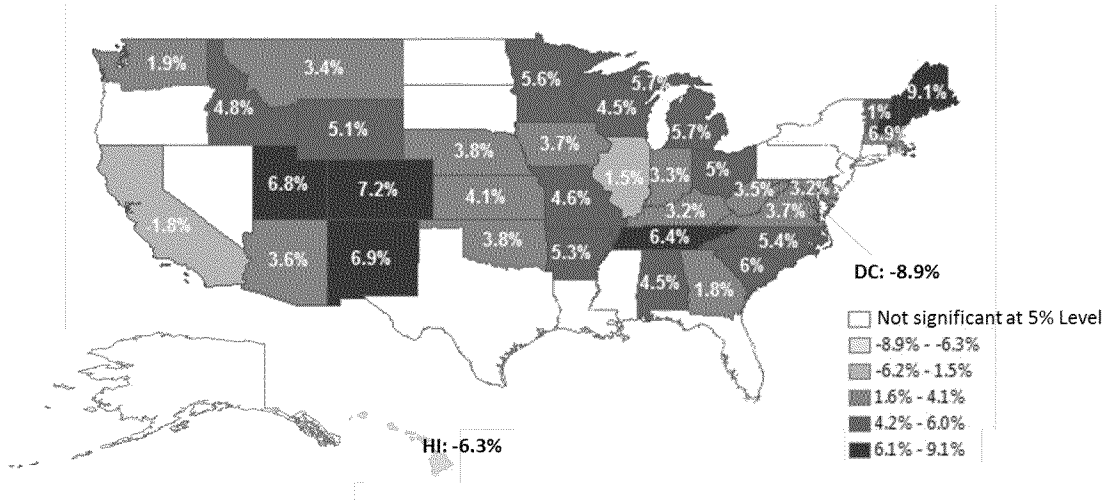

Figure 7. Estimated State Effects: Gasoline Regression Model

The impact of method of estimation is interesting in part because, like the effect of driving style, it is indirectly related to the issue of self-selection bias. Differences among estimation methods could reveal tendencies for those reporting MPG numbers to "self-enhance" in order to appear achieve better than expected fuel economy. Four methods of estimation were represented in the model:

1. Dash: MPG estimate obtained from a vehicle's dashboard display.

2. Miles: MPG estimated by dividing miles between fill-ups by gallons purchased. Participant supplies miles between fill-ups but not odometer readings.

3. Odometer: MPG estimated by fueleconomy.gov by subtracting the odometer reading at the current fill up from the reading at the previous fill up and dividing by gallons purchased at the current fill up. Most records consist of multiple fill ups and MPG is calculated as the sum of miles divided by the sum of gallons.

4. Math: MPG calculated by customer using own, unspecified method.

In the regression the default method is "did not answer", "other" or "guess". About 2.4% of the sample is in this category

Because of the error checking provided by www.fueleconomy.gov during the entry of odometer data, and because of the additional error checking performed for this study, the odometer and miles methods are believed to be the most reliable methods. In theory, the miles-based diary method should produce results similar to the odometer method, since both should be based on the same data: fuel purchases and miles traveled between fuel purchases. This seems to be the case. The estimated effects of the miles and odometer methods are close to each other, relative to the other methods. The "Odometer" method effect is statistically different from zero (at 2.1%), i.e., from the default category, although the "Miles" method effect is not. The effect of using a dashboard estimate is approximately 6.7% higher fuel economy than the default, while the "Math" method produces about 5.6% higher estimates.

VW FOIA, EPA 06/20/2017 2017-FFP_028007

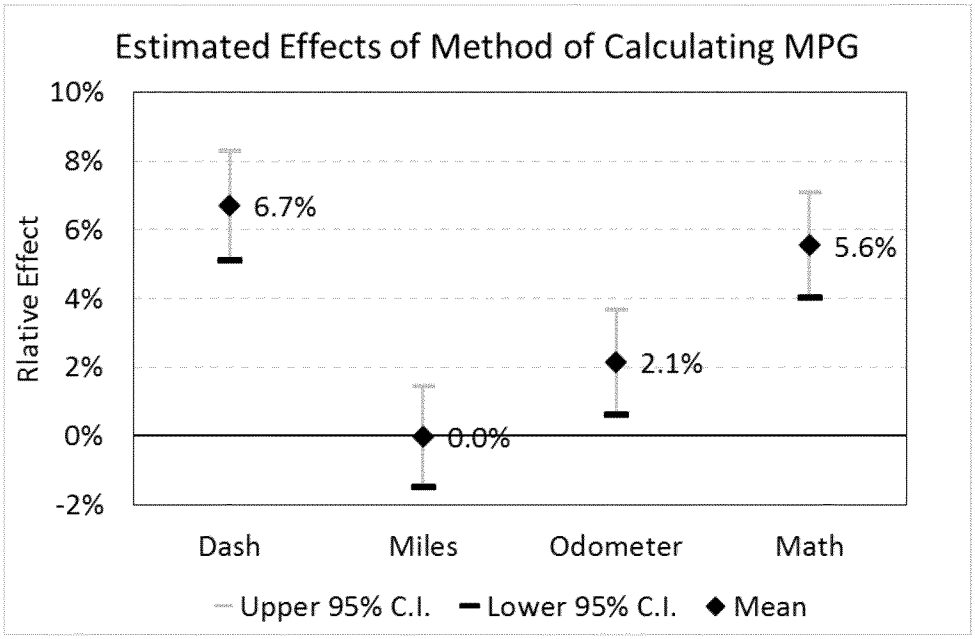

Figure 8. Estimated Effects of Method of Calculating MPG

Even after taking all the above factors into account, the unexplained variance in the My MPG estimates for conventional gasoline vehicles is substantial. A two MSE confidence interval would be +49% to -33% of the predicted value. For a vehicle with a predicted fuel economy of 25 MPG, the two MSE interval would be 17 to 37 MPG.

Following the discussion of results for hybrids and diesels, we report estimates based only on the odometer sample of conventional gasoline vehicles (12,268 records) for comparison with the full sample. A more detailed analysis of the odometer and miles-based data is planned for future study.

Hybrids

The usable sample of hybrid vehicles for the expanded regression is much smaller, 4,807 records, but it includes all years in which hybrids were sold in the U.S. from 1999 to 2015. The coefficient of test cycle MPG is smaller for hybrids than for gasoline vehicles: 0.67 vs. 0.74. The effect of (internal combustion) engine displacement is greater for hybrids: for every 10% increase in displacement fuel economy decreases by an average of 4.6%. The coefficient of CVT, is positive at 2.9%. The effect of a manual transmission is surprisingly large, a 13 percentage point reduction in the test cycle to on-road MPG shortfall; however, the early Honda Insights predominate in this group. Turbocharged hybrids are estimated to have a 20 percentage point greater shortfall but few hybrids are turbocharged. The effect of six or more gears is not significant. Four wheel or all-wheel drive vehicles have a 2.5 percentage point larger shortfall.

The effect of driving style is similar to that for gasoline vehicles. This may be surprising since many believe that hybrid vehicles are more sensitive to driving style than conventional gasoline vehicles. Like the drivers of conventional gasoline vehicles, those who drive "more

VW FOIA, EPA 06/20/2017 2017-FFP_028008

cautiously than most" or "for maximum fuel economy" get 10% to 12% better fuel economy than those who "accelerate quickly and pass whenever possible".

Relative to compacts (the default vehicle class), two-seater (mostly Honda Insights), do about 11% better on the road. SUVs are estimated to have about 9.7% larger shortfalls and large cars 7.4% larger shortfalls. Most manufacturer effects are not statistically significant. Most of the model year and state fixed effects are not statistically significant, in part reflecting the smaller sample size.

With respect to the methods of estimating MPG for hybrids, none of the method effects are statistically significantly different from zero.

Diesel

The diesel sample for the expanded regression is even smaller than the hybrid sample, totaling 2,116 usable records. As a consequence there are many fewer statistically significant variables. The coefficient of test cycle MPG is only 0.62, indicating that on-road fuel economy increases more slowly with test cycle fuel economy than for gasoline vehicles, other things being equal. Vehicles with manual transmissions have a smaller shortfall by 5.4 percentage points, but none of the other technology coefficient estimates are statistically significant. The effect of driving style on diesel fuel economy is smaller than that for gasoline vehicles with the most efficient two styles getting 6% to 7% better on-road fuel economy than the most inefficient. For diesels, the effect of the odometer method is also not significantly different from the miles method. Those basing their estimates on dashboard readouts report about 10% higher fuel economy relative to their test cycle numbers than those using the odometer method. Among vehicle classes, pickups and vans are estimated to have significantly greater shortfalls: -17% and -38%, respectively. Again, usage patterns are likely an important reason for the increased shortfall. Only one manufacturer effect is significant at the 0.05 level. None of the model year effects was statistically significant at the 0.01 level.

Odometer Sample for Gasoline Vehicles

The expanded model was re-estimated on the subsample of gasoline vehicles using the odometer record (12,268 usable records). The coefficient of test cycle MPG was slightly smaller 0.68 vs. 0.74. The estimated coefficients of most other technology variables were similar, although fewer were statistically significant. Four of the five driving style coefficient estimates were significant (relative to no answer). Again, the self-described fuel economy maximizing and more cautious groups did about 9% to 10% better than the most aggressive drivers. Most vehicle class effects were significant and, again, passenger cars had somewhat smaller shortfalls than light trucks.

The odometer data show a trend of increasing shortfall in model years that is very similar to the full gasoline vehicle sample (Figure 9). Like the full gasoline sample estimates, the effects are relative to 2015. In general, the individual model year effects are not statistically significant but the combination of all model year effects is statistically significant at the 0.003 level. Individually, only the effect for 1998 appears to be statistically significant. When compared with the statistically significant model year effects illustrated in Figure 5, this result and that for

VW FOIA, EPA 06/20/2017 2017-FFP_028009

the full gasoline sample indicate that the variables included in the expanded regression model explain much of the increase in on-road shortfall since 2004 or 2005.

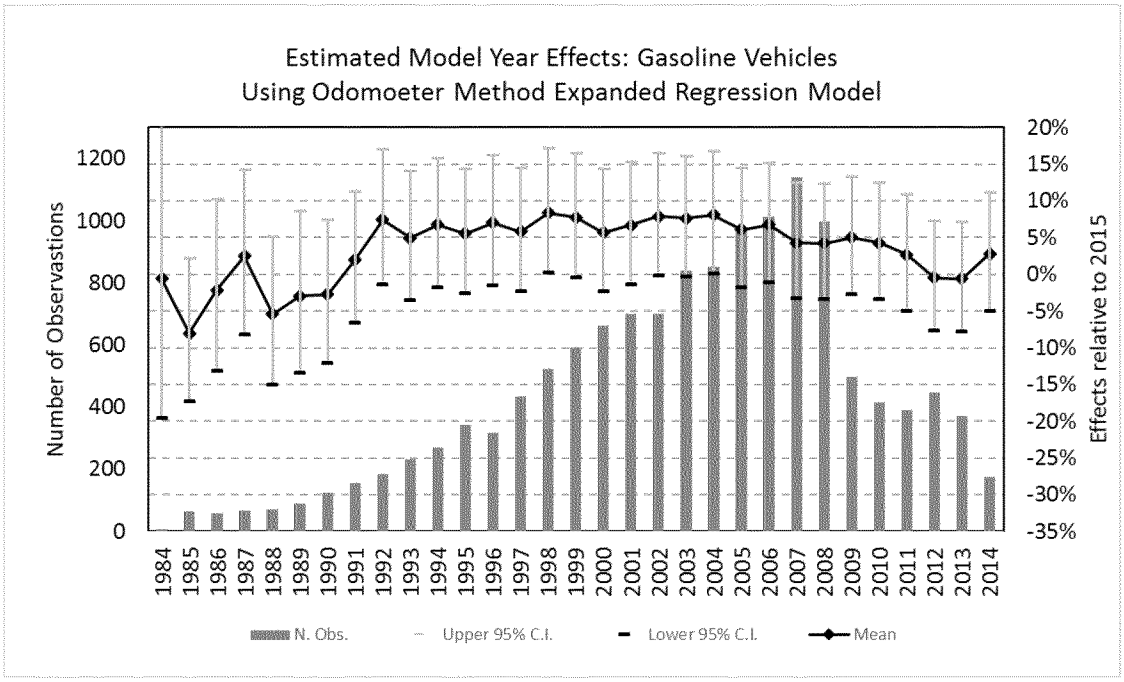

Figure 9. Estimated Fuel Economy Shortfall, Odometer Records: 1984-2014.

V. Conclusions

Perhaps the most important conclusion that can be confidently drawn from the My MPG data is that the variance of the fuel economy estimates reported by individuals is very large relative to the EPA MPG estimates for their vehicles. This conclusion is almost certainly valid whether the My MPG dataset is biased by self-selection or whether some individuals' estimates are inflated by self-enhancing behavior. A very large fraction of the variation in individual estimates could not be accounted for by the vehicle and driver variables included in our full regression models. As Greene et al. (2007) and Lin and Greene (2011) observed, it appears that the EPA MPG estimates are not strongly biased in comparison to the average fuel economy of all drivers, but that the estimates of individual drivers vary widely around the label estimates. This is to be expected given the variations in driving behavior, traffic conditions and other factors. Nonetheless, it reduces the value of fuel economy information in car buying decisions and could be an important explanation for why car buyers appear to undervalue fuel economy in car buying decisions (Sallee, 2013; Greene et al., 2013).

Modern information technology may offer a way to develop individualized fuel economy estimates. The information available from a modern vehicle's computer control system could be combined with existing information technology to generate individualized driving cycles. Driving cycles for individual motorists could be used with vehicle simulation models, calibrated to individual vehicles, to develop personal fuel economy estimates for both new and used

VW FOIA, EPA 06/20/2017 2017-FFP_028010

vehicles. While it is not clear how much estimation errors could be reduced, we believe this is an important area for future research that has the potential to enhance the value of fuel economy information to consumers.

The simple gasoline, hybrid, and diesel regression models indicate that, on average, a 1% increase in test cycle fuel economy has translated into very nearly a 1% improvement in on-road MPG. This is important because it indicates that relative improvements on the test cycle have produced equal relative improvements in on-road MPG. However, simple regressions including fixed effects for recent model years suggest that the test cycle vs. on-road gap has been growing in those years in which fuel economy standards have been increasing. Taken at face value, these results suggest that roughly one-fourth of the gain on the test cycle may have been offset by an increased gap. However, the impact on the fuel consumption and greenhouse gas reductions estimated for the standards is very small because the EPA rulemaking assumed the gap had increased from 15% to 20%. On the other hand, model year effects estimated using the expanded model, whether based on the full gasoline vehicle sample or just those using the odometer method, do not show such a large increase in the shortfall. This suggests that the technology, vehicle class and other variables included in the expanded model explain most of the increased shortfall. Given the limitations of the sample design, the evidence for an increasing gap in the U.S. is not definitive and will have to be resolved by future research.

Driving style affects real-world fuel economy. Those who describe themselves as driving cautiously or attempting to maximize their fuel economy get about 10% more miles per gallon than average or aggressive drivers.

Turbo-charged engines appear to achieve slightly lower fuel economy in the real world than would be predicted based on their test cycle numbers. The same applies to 4-wheel drive vehicles and those with larger engines. The increases in the shortfall are small, however. In general, the on-road shortfalls for light trucks are greater than those for passenger cars. How much of this is due to how the vehicles are driven versus design and technological factors is not known.

Although the data analyzed in this report are based on a self-selected sample, there are reasons to believe that the inferences drawn from it may be reliable. First, the distribution of vehicle types in the sample is generally similar to that of the vehicle fleet as a whole. Second, the vast majority of drivers do not describe themselves as driving to maximize fuel economy or even as driving more cautiously than most. Third, the statistical inferences based only on the data from drivers using the most rigorous odometer method are not generally different from those using other methods. Fourth, the estimates of the MPG shortfall, technology effects and driving style effects are generally consistent with the existing literature.

Nevertheless, the importance of fuel economy numbers for the enforcement of CAFE and GHG emissions standards and for informing car buyers' decisions, together with the unresolved issues raised by this analysis, point to the need for further research. The authors plan to carry out a more detailed analysis of the odometer data to investigate how fuel economy varies over time, how errors relate to the length of the odometer diary record, and possible correlations among

VW FOIA, EPA 06/20/2017 2017-FFP_028011

vehicles owned by the same household. Unfortunately, even this more detailed analysis will be limited by the sample design.

Ultimately, a new scientifically designed survey of in-use fuel economy is needed to insure that an unbiased sample is collected and that fuel economy is rigorously and consistently measured for all vehicles. In 2011 Transport Canada launched a Canadian Vehicle Use Study to measure the on-road fuel economy of Canadian vehicles by means of automated data loggers connected to each vehicle's computer system (Transport Canada, 2015). With lessons learned from the Canadian experience, the U.S. may be able to develop efficient and scientifically rigorous methods for measuring the relationship between test cycle fuel economy and consumers' experience in real world driving.

'Mr. Clean Water Act' faces his biggest challenge

Veteran Justice Department attorney Steve Samuels -- the government's most recognizable expert on the Clean Water Act -- is facing the greatest challenge of his long career: defending the Obama administration's contentious new Waters of the U.S. rule. Challenges from 31 states, countless industry groups and even a few environmental nonprofits has sprung up in courts across the country, paving a road of litigation that seems almost certain to reach the Supreme Court.

Hi Erin,

See below. Ex. 7 and I complained to VW yesterday about VW's press release saying cars would be recalled when no heads up was given to either agency. In partial response, VW has shared the following contact names from their press team. I would think that we should develop some kind of press team to press team communications channel with VW apart from the recall channel (Ex. 7 - CARB, Byron-EPA and Ex. 7 -VW) and the enforcement channel (Ex. 7 -CARB, Phil Brooks-EPA and Ex. 7 -VW).

Can you see that this information is shared as appropriate?

Thanks,

Byron

Abstract

U.S. government fuel economy tests are used for two primary purposes: 1) to monitor automobile manufacturers' compliance with fuel economy and greenhouse gas emissions standards and 2) to inform consumers about the fuel economy of passenger cars and light trucks. This study analyzes a unique database of 75,000 fuel economy estimates self-reported by customers of the U.S. government website www.fueleconomy.gov to evaluate the effectiveness of the government's estimates for these two purposes. The analysis shows great variability in individuals' own fuel economy estimates relative to the official government estimates, but much smaller bias relative to the sample average. For consumers, the primary limitation of government fuel economy estimates is their uncertainty for a given individual rather than bias relative to the average individual. The analysis also examines correlations between individuals' fuel economy estimates and specific technologies, vehicle class, driving style, method used to calculate fuel economy, manufacturer, and state. There is some evidence that the shortfall between test cycle fuel economy estimates (used to measure compliance with regulations) and in-use fuel economy estimates (such as those provided by customers of www.fueleconomy.gov) has been increasing since 2005. The direction and magnitude of the trend is consistent with changes made by the Environmental Protection Agencies to its methods for calculating the benefits of the standards in the 2010 and 2012 rulemakings. However, if the trend continues, it could affect the benefits realized by fuel economy and greenhouse gas emissions standards. A scientifically designed survey of in-use fuel economy is needed to insure that an unbiased sample is collected and that fuel economy is rigorously and consistently measured for all vehicles. The potential for information technology to reduce the uncertainty in predicting individuals' on-road fuel economy should be explored.

I. Introduction

The window sticker of every new passenger car or light truck sold in the U.S. bears a label with a prominently displayed government fuel economy rating. The intent is to provide consumers with consistent and reliable information they can use when comparing vehicles. Each label also contains the following caveat: "Actual results will vary for many reasons, including driving conditions and how you drive and maintain your vehicle." Differences between consumers' experiences with fuel economy and label values have been a source of discussion and dissatisfaction with the official government ratings since shortly after they were first introduced in 1975 (McNutt et al., 1978).

The U.S. Environmental Protection Agency (EPA) provides two sets of fuel economy estimates ("test cycle" and "label") for every make, model, engine and transmission configuration of passenger car and light truck sold in the U.S.[1] These estimates are important for two main reasons: (1) to enforce the Corporate Average Fuel Economy (CAFE) and greenhouse gas (GHG) emissions regulations for light-duty vehicles (EPA, 2012) the government needs test cycle estimates that are equitable to manufacturers, repeatable and proportional to real world experience and (2) consumers need accurate fuel economy estimates to make informed choices when buying vehicles.

1 In fact, most vehicle testing is done by the vehicle manufacturers, who certify to the EPA that the tests have been done in accordance with government procedures. The EPA tests 15-20% of vehicles each year to verify compliance (EPA, 2014a).

VW FOIA, EPA 06/20/2017 2017-FFP_028040

In statistics, the terms accurate, precise and unbiased have specific, mathematical definitions. Accuracy measures the closeness of agreement between repeated measures of a given quantity and its true value. Precision measures the closeness of agreement between repeated measures of a given quantity and the mean of those measures. Bias measures the difference between the mean of a series of measurements or predictions and the true value of a quantity or the true mean of a population. The situation is somewhat different for government fuel economy estimates. A single number (e.g., a car's fuel economy label number) is proposed as a useful estimate of the actual fuel economies of all motorists using the same vehicle[2]. In this case, there is no "true value" but rather a distribution of values for individual drivers. Assuming that the government fuel economy estimate is intended to correspond to the average fuel economy of all drivers of a given vehicle, bias can be defined as the difference between the official estimate and the mean of the population.[3] Because there are not repeated measurements for an actual or even hypothetical true value of fuel economy, how to define accuracy and precision is less clear.[4] In this paper we will quantitatively describe the deviations of individual motorists' estimates from their vehicle's fuel economy rating as *variance*. At the same time, we recognize that from an individual motorist's perspective, the official rating might be perceived as biased or inaccurate.

The government is well aware of the issue of the variance of individual fuel economy results. Every fuel economy label contains the following caveat:

> "Actual results will vary for many reasons, including driving conditions and how you drive and maintain your vehicle."

It is quite possible for fuel economy ratings to be unbiased (reasonably predict the average fuel economy of all motorists) but poor predictors of the experiences of individuals. For the purposes of testing compliance with fuel economy standards, unbiased fuel economy estimates would be sufficient. If the expected fuel economy improvements are realized on average, the expected benefits in petroleum and greenhouse gas (GHG) reductions will be achieved. In fact, all that is necessary for the expected benefits to be realized is that a given percent increase in miles per gallon (MPG) on the test cycle produce the same percentage increase in on-road fuel economy. On the other hand, for the fuel economy label estimates to be of greatest value to consumers' car purchase decisions, they should accurately predict the fuel economy an individual will experience on the road. This is clearly not achievable with a single-number rating for each vehicle. However, modern information technology might possibly enable relatively accurate prediction of individuals' fuel economy.

The test cycle fuel economy estimates used to determine manufacturers' compliance with regulations are based on laboratory testing of vehicles over two (city and highway) driving

2 Here, a vehicle means a unique vehicle as defined for regulatory purposes, typically a specific configuration of make, model, model year, engine and transmission.

3 When fuel economy is measured in miles per gallon, the simple average of the fuel economies of a population of drivers will not equal the sum of all miles driven divided by the sum of all gallons consumed. The harmonic mean of the individual fuel economies, weighted by each vehicle's miles traveled will.

4 A single estimate for a range of values is absolutely precise because its variance is zero. On the other hand, it is inherently inaccurate; the only question being how inaccurate it is.

cycles as required by statute. These drive cycles have been in use since the Corporate Average Fuel Economy (CAFE) standards were enacted in 1975. The label fuel economy estimates provided on the window stickers of new vehicles and used in advertising and the media are based on five drive cycles, adjusted in an attempt to reflect average U.S. on-road experience. The five cycles include the "city" and "highway" cycles used to determine compliance with fuel economy and greenhouse gas emission standards plus additional cycles that reflect, 1) more aggressive driving behavior, 2) the impact of operating under colder ambient conditions and, 3) the impact of air conditioner use.

This study addresses how well the test cycle and label estimates serve their intended purposes though a statistical analysis of approximately 75,000 individual fuel economy estimates voluntarily submitted to the "My MPG" section of the government website www.fueleconomy.gov. The relationship between individuals' own fuel economy estimates (My MPG) and the EPA label estimates is analyzed to determine whether the adjusted EPA estimates are unbiased and to measure the variability of consumers' experiences relative to the label numbers. The relationship between individuals' My MPG estimates and EPA test cycle estimates is examined to shed light on whether the ratio of test cycle to on-road MPG has been changing with succeeding model years. A continually increasing gap would imply that the government's fuel economy standards might not achieve as much reduction in oil use and GHG emissions as intended.[5] The need to monitor on-road fuel economy was recognized by the Environmental Protection Agency (EPA) and the National Highway Traffic Safety Administration (NHTSA) in their fuel economy and greenhouse gas rule for light-duty vehicles.

> "The agencies recognize the potential for future changes in driver behavior or vehicle technology to change the on-road gap to be either larger or smaller." (Federal Register, 2012, p. 62715)

The agencies assumed that a gap of 20%, which is consistent with fuel economy labeling, would continue through 2025, with minor adjustments for fuel energy content (EPA, 2012, pp. 4-1 to 4-7). This represents an increase of 5% over the 15% gap that had been assumed in previous EPA analyses.

The impacts of fuel efficient technologies such as turbo-charging and transmissions with higher gear counts are estimated to see if they perform better or worse on the road in comparison to the test cycles. The analysis also attempts to take into account driving conditions that vary from state to state and other factors that might influence on-road fuel economy.

The scope of this study is limited to light-duty vehicles with conventional gasoline (gasoline), gasoline-electric hybrid (hybrid), and diesel powertrains due to the nature of the data available from www.fueleconomy.gov .

5 The agencies' rulemaking assumes the gap will remain at 20% through 2025, with some minor adjustments for fuel energy content and air conditioner efficiencies (EPA, 2012, pp. 4-2 to 4-7).

VW FOIA, EPA 06/20/2017 2017-FFP_028042

II. Previous Research

When the EPA fuel economy estimates were first introduced in 1975, they were not adjusted for real-world driving conditions. Concern about the ability of the test cycle estimates to measure on-road fuel economy motivated assessments by government, industry and consumer groups. In the first year the CAFE Standards took effect (1978), researchers at the U.S. Department of Energy (DOE) published an analysis of over 5,000 fuel economy records for model year 1974 to 1977 vehicles, obtained from a variety of sources (McNutt et al., 1978). Noting that the test cycle estimates were "fairly representative" of the on-road values for the 1974 model year, the researchers observed a trend of increasing shortfall.

> "However, beginning in the 1975 model year and continuing through 1977 (the limits of existing data) the EPA certification values become an increasingly poorer representation of actual on-road fuel economy."

They estimated that the average shortfall had increased from 4% in model year 1974 to about 20% for model year 1977.

In 1980 and 1981, General Motors (GM) conducted surveys of private owners of 1981 model year vehicles and asked them to record odometer readings and fuel purchases at their next four fill-ups (Schneider et al., 1982). From the 38,466 forms mailed out in the 1981 survey, 4,923 (12.8%) usable responses were received. The EPA test cycle combined fuel economy estimate for the vehicles was 25.5 miles per gallon (MPG) while the respondents' average on-road fuel economy was 22.0 MPG, implying a shortfall of almost 14%. The earlier 1980 survey had produced an estimated shortfall of just over 16%. Front-wheel drive vehicles averaged a 6.4% smaller shortfall than rear-wheel drive vehicles, diesels had a 6.5% smaller shortfall than gasoline vehicles, and manual transmissions had 7.2% higher on-road fuel economy than automatic transmissions.

A study by Ford based on data from employees who leased Ford vehicles found that the shortfall for 1978 model year vehicles averaged 20%, but for 1979 and later model year vehicles, the shortfall was relatively stable at about 14% (McKenna and South, 1982). The Ford study also found that the shortfall for winter driving was 10% greater than for summer driving.

Analyzing a much larger data base of 56,395 vehicles amassed from a variety of sources, McNutt et al. (1982) found large variations in the fuel economy shortfall by model year but no consistent trend over time. They also found important differences between passenger cars and light trucks, rear-wheel drive and front-wheel drive vehicles, and manual and automatic transmissions. Their data showed a strong tendency for the percent shortfall to increase with increasing fuel economy. Overall, they estimated a shortfall of 21% for model year 1981 vehicles. Having quantified variations in the shortfall by technology, vehicle class, model year and make and model, the study was the first to analyze the implications of uncertainties about on-road fuel economy for car buyers:

> "These impacts include the inability of new car buyers to accurately compare different

model vehicles and the difficulty in projecting future fuel demand based on the EPA values."

These studies and other evidence led the U.S. EPA to adjust downward the fuel economy estimates reported to the public on window stickers and in advertising (Hellman and Murrell, 1984). A vehicle's fuel economy estimate on the city test cycle was multiplied by 0.90 and its highway cycle estimate was multiplied by 0.78. The effect on a typical vehicles combined[6] fuel economy estimate was approximately a 15% reduction relative to the test cycle numbers. However, the unadjusted test cycle numbers continued to be used to determine compliance with fuel economy standards, as required by statute, and they still are today.

At least one subsequent analysis of on-road fuel economy suggested that the on-road shortfall might have increased since the 1984 study. Mintz et al. (1993) analyzed data from the Energy Information Administration's (EIA) 1985 Residential Transportation Energy Consumption Surveys (RTECS). RTECS collected gasoline purchase and odometer reading diaries from 3,891 households representing 8,401 vehicles. Comparing the on-road estimates to the unadjusted EPA test cycle MPG values, they found a shortfall of 18.7% for passenger cars and 20.1% for light trucks, somewhat larger than Hellman and Murrell's (1984) 15%.

Despite the adjustments to EPA label estimates, the "shortfall" or "gap" between the EPA label estimates of new car fuel economy and what real people achieve in their day-to-day driving continued to be a topic of interest to the public and the media (e.g., O'Dell, 2012). Some media organizations conduct their own tests on public roads in order to compare "real-world" estimates to the EPA's label estimates. *Consumer Reports*, for example, has made such comparisons for years. In a 2005 study, it concluded that fuel economy for conventional gasoline vehicles averaged 9% worse than label estimates, while hybrids were 18% below the label estimates (ConsumerReports.org, 2013). In 2008, the EPA (2006a) made further downward adjustments to label estimates. Consequently, a 2013 *Consumer Reports* study found conventional gasoline vehicles averaged only 2% below the EPA label estimates while hybrids fell short by 10%.

In developing the new 2008 fuel economy label estimates, the EPA analyzed several sources of on-road fuel economy estimates (EPA, 2013, Ch. 2). One was a sample of 8,180 estimates for 4,092 vehicles from users of the My MPG section of the DOE/EPA website www.fueleconomy.gov. For conventional gasoline vehicles, the My MPG data indicated that the label numbers based on the 1984 adjustment procedures were still reasonable estimates of average on-road fuel economy. For conventional gasoline vehicles the average label to on-road shortfall was only 1.4%. However, the shortfall for hybrid vehicles averaged 8.2%. As discussed below, these results closely match those obtained by Greene et al. (2007) in an analysis of a similar sample of the My MPG data.

The EPA, the Coordinating Research Council (CRC), the Department of Transportation (DOT), and the DOE measured the fuel economy of 120 vehicles, including 30 hybrid vehicles,

6 The combined fuel economy estimate is a weighted harmonic mean of the city and highway estimates, equal to 1/((0.55/city)+(0.45/highway)). The adjusted formula is 1/((0.55/(0.90*city))+(0.45/(0.78*highway))).

in the Kansas City region (EPA, 2006, Ch. 2). The vehicles were driven by their owners, and data were collected over a 24-hour period by means of portable emissions measurement systems. A zero-intercept regression line predicting on-road fuel economy as a function of the 1984 EPA fuel economy label estimate indicated that conventional gasoline vehicles would average about 0.6% higher fuel economy on the road than the label values suggested. For hybrids, however, an average shortfall of 11% was observed

The problem of achieving a consistent, proportional relationship between fuel economy as measured on laboratory tests relative to what drivers will experience in the real world is not limited to the U.S. Similar shortfalls between test cycle and on-road fuel economy have also been observed in China and much larger shortfalls have been reported for the EU. Two recent studies by the International Council on Clean Transportation (ICCT) found that the on-road to certification test shortfall for vehicles sold in the European Union (EU) has been increasing rapidly (Mock et al., 2014; Mock et al., 2013).

> "All data sets we examined demonstrate the same over-arching trend: the discrepancy between type-approval and real-world CO_2 emissions is increasing. While in 2001 this gap was just 8 percent, it grew to 18 percent by 2008 and then to 38 percent in 2013." (Mock et al., 2014, p. 43)

The ICCT analyses conclude that the increasing gap is most likely due to increasing use of technologies that perform better on the certification ("type approval") test than in the real world, increasing use of flexibilities in the testing procedures, and external factors not accounted for in the test, such as increased use of air conditioning. On the other hand, increased use of strategies to maximize test results are cited by Dings (2013) as the most important factor. Dings attributes approximately half of the gap to permitted techniques for optimizing performance on the EU's test procedures that do not correspond to benefits in actual use. He allocates the remaining 50% equally among factors omitted from the test (e.g., air conditioner use), differences between the test cycle and actual driving behavior and conditions, and unknown factors.

Like the data used in this study, the ICCT data came from self-selected samples or business fleets. Potential sources of bias are acknowledged and briefly discussed in the report. However, the ICCT studies assert that model-year trends in the on-road shortfall should be insensitive to the sample design provided that the design does not change across model years. Because of this, the fact that their sample is self-selected should not affect inferences about the increasing on-road shortfall. The ICCT report also points to the fact that the trends are relatively consistent across different data sources.

Also relying on self-reported data obtained from customers of a fuel economy website, Chinese researchers measured the shortfall between official Chinese government estimates and the reported on-road fuel consumption (Huo et al., 2011). For 2009, they found that on-road fuel consumption (gallons per mile) averaged 15.5% above the test cycle numbers. For the 153 makes and models in their data base, the range of increased on-road fuel consumption was from -8% to +60%.

This study uses the My MPG data of www.fueleconomy.gov to analyze the relationships between both test cycle and label fuel economy and what motorists say they achieve in their real world driving. The My MPG data have been analyzed three times before but with fewer samples and model years than are included in this analysis. Greene et al. (2006) regressed reported My MPG numbers against the EPA label estimates using the first 3,221 estimates supplied by customers of www.fueleconomy.gov. The EPA label estimates were based on the 1984 adjustment method since the study predated the 2008 adjustment method. The study found that the adjusted label estimates were nearly unbiased predictors of the average fuel economy of My MPG customers. On the other hand, the EPA label estimates were highly imprecise predictors of any given customer's MPG estimate. This led to the following conclusion.

> "These results imply that what is needed is not less biased adjustment factors for the EPA estimates but rather more precise methods of predicting the fuel economy individual consumers will achieve in their own driving." (p. 99)

Greene et al. (2006) also recomputed EPA label estimates for those customers who provided estimates of their percentages of city and highway driving. Using customer-specific city and highway MPG weightings reduced the mean standard error (MSE) of their model from 3.42 to 2.89, or by about 15%.

Lin and Greene (2011) analyzed 31,227 My MPG records using linear models and ordinary least squares (OLS) regression with robust error estimation. Their goal was to develop models that could more accurately predict a given individual's on-road fuel economy using data that could readily be supplied by the motorist. They found that accuracy rather than bias remained the chief limitation of the EPA label estimates, and that the bias of the 2008 adjustment method, relative to the My MPG numbers, was greater than that of the 1984 method. Their best model, however, was able to reduce the mean squared error (MSE) of prediction by only about one third versus the "naïve" prediction that on-road fuel economy equals EPA label fuel economy.

The ICCT's study of EU experience (Mock et al., 2013) includes a brief analysis of an earlier version of the My MPG data set used in this study. They concluded that the gap between U.S. test estimates and the on-road data was relatively steady at about 20% until model year 2003. After 2003, they found that the gap increased, reaching about 35 percent for model year 2012.

III. Data

Data for this study were obtained from the joint DOE/EPA website www.fueleconomy.gov . Since 2005, the website's My MPG section has offered its customers the opportunity to select their vehicles from its database, enter their own fuel economy estimates, compare their estimates with the official EPA label estimates, and share their estimates with other users of the website. The site accepts fuel economy estimates derived by any method, but it provides guidance on how to measure fuel economy and checks data entered for errors and plausibility (Goeltz et al., 2005). For those who want to create fuel purchase diaries, the site provides templates for entering odometer readings (or miles traveled), fuel quantities purchased, price paid, percentage

VW FOIA, EPA 06/20/2017 2017-FFP_028046

of city and highway driving, and date for any number of refueling events. Consistency checks are made as data are entered, and potential errors are brought to the customer's attention. Alternatively, customers may supply estimates based on their vehicles' dashboard readout, their own calculations, or by simply guessing.[7] The distribution of vehicle records in the My MPG database by type of estimation method is shown in Table 1.

Table 1. Distribution of My MPG Data by Participant's Method of Calculation

Method	Frequency	Percent
Vehicle's Computer Display (dash)	11,804	15.3
Miles & Fuel Purchase Diary (miles)	15,086	19.56
Odometer & Fuel Purchase Diary (odom)	15,854	20.56
Calculated by Own Method (math)	32,645	42.33
Guess	779	1.01
Other & Unknown	958	1.24
Total	77,126	

For estimates to be accepted, the customer must respond affirmatively to a return e-mail sent by the site, as a guard against spurious or repetitive entries. In order for customer-supplied estimates to be shown on fueleconomy.gov, they must pass validity tests. For this study, however, all e-mail validated data were accepted. Outlier detection was based on statistical criteria, as described below.

The My MPG data are susceptible to a variety of errors, including simple recording errors or calculation errors by those doing their own calculations. However, the website provides forms with built-in error checking for those entering odometer readings and fuel purchases at each fill up. MPG estimates based on long trips or summer driving tend to overestimate total annual fuel economy, while measurements taken under unfavorable conditions, such as towing or driving in congested traffic or on snowy winter roads, result in underestimates. The variance of the My MPG estimates around either of the EPA estimates is relatively large. On the other hand, the My MPG data may be the best source of information about motorists' beliefs about their vehicles' fuel economies.

Figure 1 shows My MPG data plotted against the EPA combined unadjusted test cycle fuel economy estimates. The unadjusted test cycle estimates are used to determine vehicle manufacturers' compliance with federal fuel economy and greenhouse gas emission regulations. Four different powertrain technologies are shown in different colors. Unfortunately, there is no information about how often owners of flexible fuel vehicles (FFVs) use E85 versus gasoline. In the figures below FFVs are compared to their fuel economies when using gasoline. In Figure 1

7 In 4,708 cases, estimates made by different methods were provided for the same vehicle. In the case of such repeated observations, each estimate was treated as a distinct observation, resulting in 77,126 total observations for the 72,211 vehicles.

the majority of the data points for every powertrain technology fall below the line on which test cycle = reported on-road MPG, reflecting the well-known bias of the test cycle estimates.

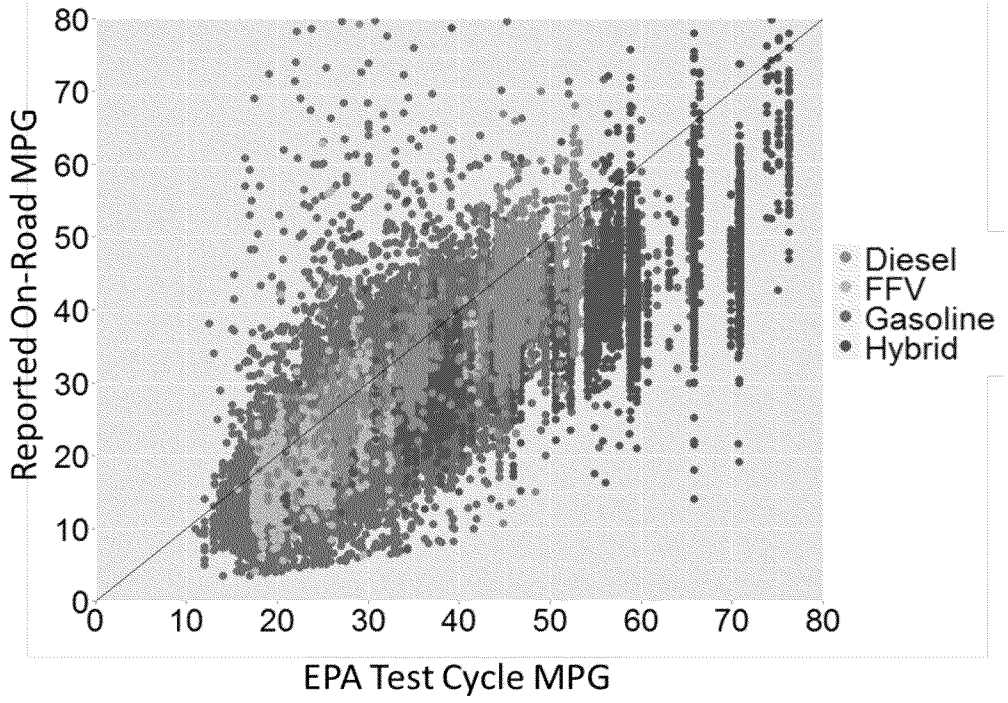

Figure 1. My MPG On-Road Estimates vs. EPA Test Cycle MPG Estimates for All Vehicle Types

Figure 2 shows My MPG data plotted against the current EPA label fuel economy estimate, which has been adjusted to better reflect average on-road fuel economy.[8] The adjusted label estimates are used to inform consumers in advertising and on the government website www.fueleconomy.gov. Bias is less evident in Figure 2, although for gasoline vehicles there appears to be a tendency for the label MPG to underestimate MPG at higher MPG values (most observations fall to the left of the line) and overestimate the reported on-road MPG at low MPG values (the majority of observations fall to the right of the line on which both values are equal and hence Label MPG > On-Road MPG). This tendency does not appear to apply to hybrid vehicles, however. Most estimates exceed the 2008 label MPG: 75% for gasoline vehicles, 93% for diesels and 60% for hybrids.

8 The 2008 adjustment method has been used for all model years, as implemented by www.fueleconomy.gov.

VW FOIA, EPA 06/20/2017 2017-FFP_028048

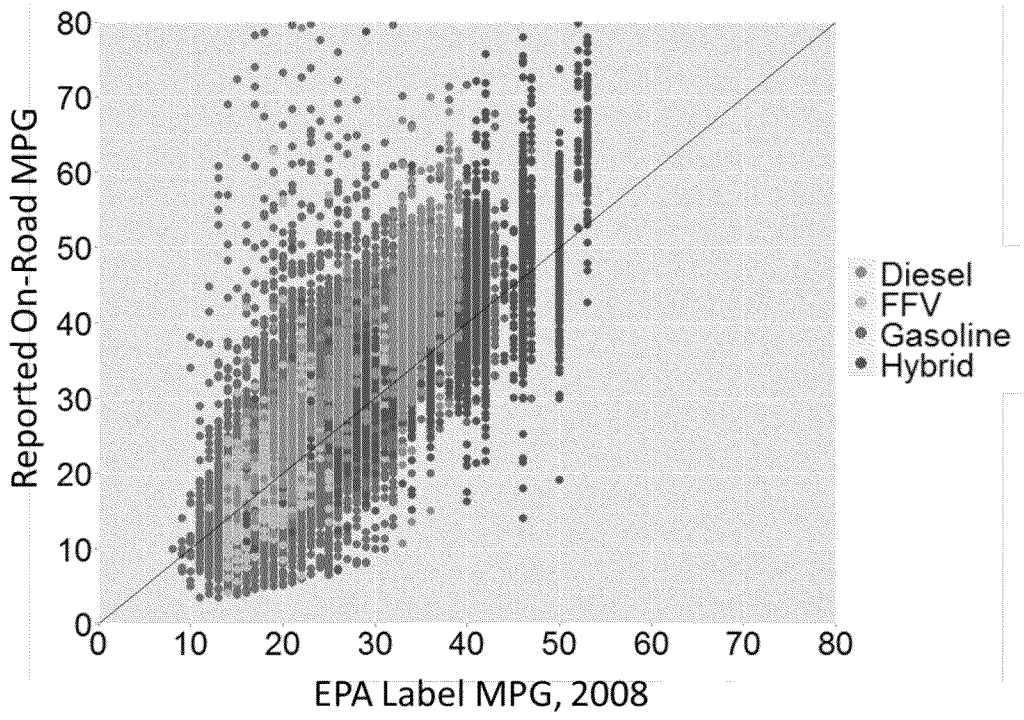

Figure 2. My MPG On-Road Estimates vs. EPA Label MPG Estimates for All Vehicle Types

The My MPG data have strengths and weaknesses. The large number of observations and detailed matches to the owners' vehicles by make, model, engine and transmission make this a unique publicly available source of information. There are observations from every state and for every model year of vehicle from 1984 to 2015. The information supplied by many participants about method of estimation and driving style enables additional inferences. A disadvantage of the My MPG data is that participants are a self-selected sample. While the distribution of the sample can be compared with other known distributions, there remains a potential for bias related to the participants' interest in fuel economy. The methods by which the data are provided by customers of www.fueleconomy.gov have not changed over time so that if there is a bias in the data it is likely to remain consistent over time.

While it is not possible to definitively establish bias or lack thereof, frequency distributions of the respondents give some indication of the representativeness of the sample. The distribution of respondents by type of vehicle is compared with model year sales by vehicle class from 2000 to 2014 (EPA, 2014b) in Table 2. Passenger cars appear to be over-represented in the My MPG sample and all types of light trucks somewhat under-represented.

VW FOIA, EPA 06/20/2017 2017-FFP_028049

Table 2. Distribution of Vehicles by Vehicle Class for 2000-2014 Model Years

New vehicles as a share of production				Shares in My MPG sample	
	Mean	Min	Max		
Car	52.7%	47.7%	60.5%	Car	67.56%
SUV	27.7%	18.9%	35.7%	SUV	17.72%
Pickup	13.4%	10.1%	16.1%	Pickup	10.42%
Minivan/Van	6.2%	3.8%	10.2%	Minivan/Van	4.30%

The My MPG sample also appears to be reasonably geographically representative. A simple correlation of the sample frequencies by state with the 2010 Census state population estimates produced a correlation coefficient of 0.971. The correlation with the Federal Highway Administration's state motor vehicle registration estimates for 2010 was similar, 0.976.[9]

One might suspect that individuals who would monitor their vehicles' fuel economy and submit data to www.fueleconomy.gov would be more likely than the average driver to maximize fuel economy. Although the distribution of driving styles in the general population is not known, the distribution of participants by self-described driving style does not reveal a predominance of eco-drivers. Only 17% of the participants described themselves as more cautious than most drivers and only 2% said they drive to maximize fuel economy (Table 3). Nevertheless, the potential for bias in a self-selected sample remains. As a consequence, the results of this analysis must be interpreted with caution.

Table 3. Distribution of My MPG Participants by Self-Reported Driving Style

Driving Style of Primary Driver	Count	% 1 to 5	% of Total
Drives for maximum gas mileage (1)	602	2.23	0.78
Drives more cautiously than most (2)	4,709	17.43	6.11
Drives with the flow (3)	7,024	25.99	9.11
Drives a little faster than most (4)	9,709	35.93	12.59
Accelerates quickly and passes whenever possible (5)	4,978	18.42	6.45
Not reported	50,104	-	64.96
Total	77,126		

Three measures of fuel economy are used in the analysis below (Table 4). The corresponding distributions (including log-transformed distributions) are shown in Figure 3. The "My MPG" numbers are those reported by individuals throughout the U.S. using www.fueleconomy.gov's My MPG system. MPG numbers adjusted by the EPA for use on vehicle window stickers and for public information are termed "EPA Label" estimates. "EPA Test Cycle" estimates are the

9 Table MV-1, Highway Statistics 2010, accessed on 3/18/2015 at, http://www.fhwa.dot.gov/policyinformation/statistics/2010/mv1.cfm.

VW FOIA, EPA 06/20/2017 2017-FFP_028050

unadjusted MPG estimates based on the EPA's city and highway cycle dynamometer tests. The test cycle estimates are used to certify manufacturers' compliance with fuel economy standards.

Table 4. Sample* Means of Three Fuel Economy Metrics

Fuel Economy Metric	Sample Mean	Std. Dev.
My MPG User Estimate	26.02	10.02
EPA Test Cycle Estimate	30.56	10.73
EPA Label Estimate	23.08	7.35

*Includes only gasoline, hybrid and diesel powertrains. Outliers deleted if My MPG > 150 or <2, or if more than 5 standard errors above or below regression line of My MPG on EPA Label Estimate. 76,755 observations remained in the sample.

Other variables describe vehicle attributes or represent fixed model year or state effects. The variable "cid" stands for cubic inch displacement but is actually a vehicle's engine size in cubic liters. Zero-one indicator variables include transmission type: "cvt" for continuously variable and "manual" for manual transmission. Transmissions with seven or more gears are designated by the variable "gears7", six or more by "gears6." Other indicator variables represent 4-wheel drive (fourwdr), all-wheel drive (allwdr), and front wheel drive (frontwdr). The categories of driving style are listed in Table 3, with the first five being represented by "style1" to "style5," consecutively. The methods by which participants estimated their fuel economies are represented by the (1,0) variables "dash," "miles," "odom" and "math," as shown in Table 1. The ten largest auto manufacturers are represented by (1,0) variables with the rest combined being the default. Model years 1984 to 2014 and the 50 states plus the District of Columbia are also represented by fixed effects, with 2015 and state not reported used as the default values.

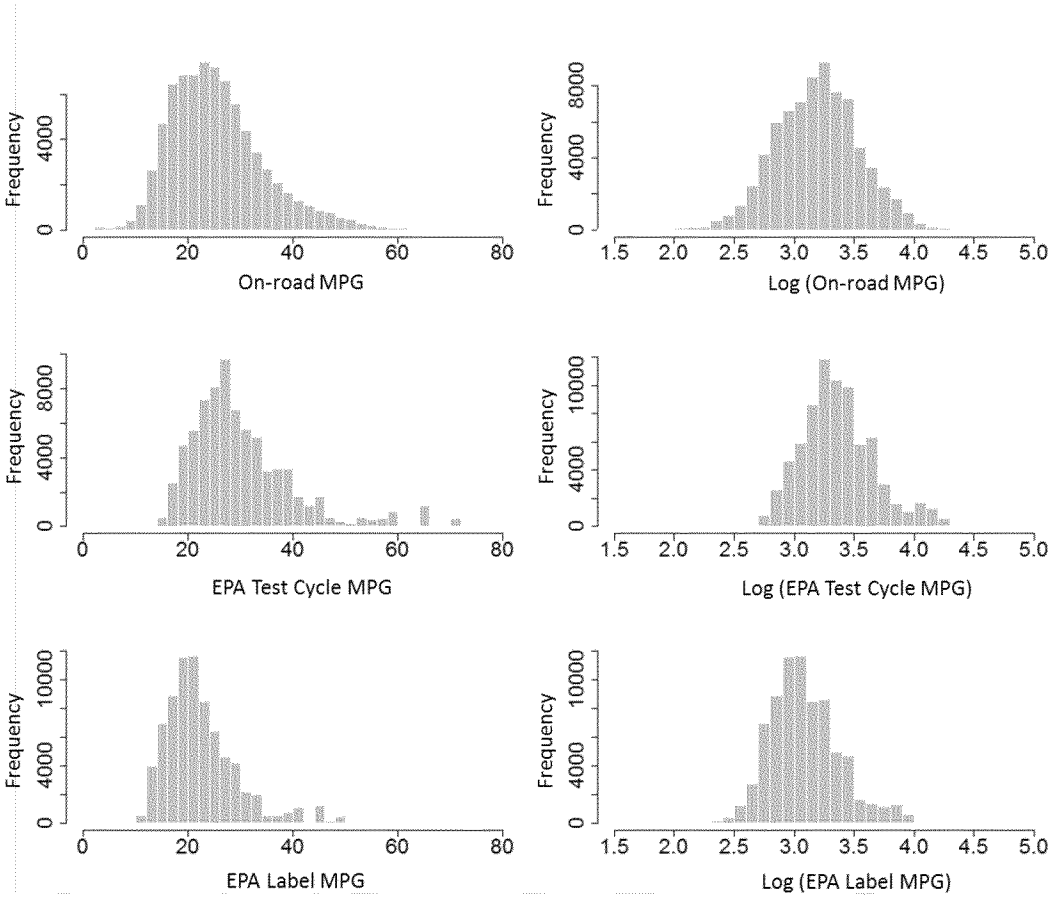

Figure 3 Distribution of My MPG, EPA Test Cycle and EPA Label estimates.

IV. Method

When estimating the relationships between MPG values measured on a dynamometer and those measured on the road, there are three reasons for preferring the log-log functional form. The first is that it treats fuel economy (miles per gallon) and fuel consumption (gallons per mile) symmetrically (log(mpg) = -log(gpm)). Estimated coefficients would have identical values and standard errors but opposite signs. Each coefficient represents the percent change in fuel economy for a 1% change in the respective variable. The second reason is that the effects of many of the factors influencing vehicle fuel consumption are multiplicative rather than additive. For example, the efficiency with which the chemical energy in fuel is converted into mechanical work at a vehicle's wheels is equal to the engine efficiency multiplied by the transmission efficiency, while the energy required to move a vehicle a given distance equals one over the drivetrain efficiency multiplied by the work that must be done to overcome aerodynamic drag, rolling resistance and inertia. The third reason, as will be shown below, is that the residuals from the log-log regression better approximate the more desirable properties of errors in regression models.

VW FOIA, EPA 06/20/2017 2017-FFP_028052

The general estimating equation is therefore,

Equation 1

$$\log\left(MyMPG_i\right) = \alpha + \beta \log\left(testcycleMPG_i\right) + \sum_{j=1}^{n} b_j x_{ij} + \varepsilon_i$$

The coefficient β in the general equation represents the percent change in on-road MPG for a 1% change in test cycle MPG, controlling for the n variables x_{ij}. Alpha (α) is a common constant term, ε_i is a driver/vehicle-specific random error, and *i* is the index for each vehicle in the My MPG database. When the x_{ij} are (0,1) indicator variables, e^{b_j} is the multiplicative effect of factor j on MPG. For example, if $b_j = -0.05$, then $e^{b_j} = 0.951$, implying that the effect of factor j is to reduce fuel economy by 4.9%.

The unconditional value of β is also of interest as a measure of the average U.S. relationship between on-road and test cycle MPG.

Equation 2

$$\log\left(MyMPG_i\right) = \alpha + \beta \log\left(testcycleMPG_i\right) + \varepsilon_i$$

Finally, the linear relationship between on-road MPG and the EPA estimates posted on new vehicles' window stickers and used in advertising is also of interest because it describes the correlation between the information provided to consumers and what consumers experience. Larrick and Soll (2008) found that consumers interpret fuel economy information linearly in terms of miles per gallon rather than in terms of gallons per mile. A linear formulation is therefore used in this regression.

Equation 3

$$MyMPG_i = \alpha + b\left(labelMPG_i\right) + \varepsilon_i$$

All the regressions in this report were carried out using the STATA® "regress" procedure, with the "robust" correction for heteroskedastic errors.[10] Outliers for gasoline and diesel vehicles were identified by first regressing the log of observed MPG on the log of the combined test cycle fuel economy and a constant. The estimated variance of the residuals from the regression was used to detect potential outliers. Upper and lower bounds for outlier detection were increased in integer multiples of the MSE of regression until there was no evident truncation

10 STATA® is a registered trademark of StataCorp LP (2015).

in the graphs of residuals. The mean squared error (MSE) of the regression is relatively large, reflecting the degree of variance evident in Figures 1 and 2. Because the residuals from the regression were skewed towards negative values, the upper boundary was set at +5 standard errors while the lower boundary was set at -6 standard errors from the combined adjusted EPA label MPG estimate. Errors are multiplicative in the logarithmic model, so a lower bound of -6*0.336 allows a fuel economy estimate 87% below the regression line while an upper bound of +5*0.336 sets a limit of 5.4 times the regression line value. These outlier limits rejected only 302 observations (0.45%) from the gasoline vehicle sample. The MSE of the diesel regression is smaller but still large relative to predicted fuel economy. Only 13 hybrid records and five diesel records were deleted as outliers. The outlier detection regression results for gasoline and diesel vehicles are shown in Table 5.

Table 5. Outlier Detection Regressions of My MPG on EPA Test Cycle Combined MPG Estimates

Variable	Estimate	Standard Error	Significance Level	Root MSE	R-squared	No. Obs.
Gasoline Vehicles						
Test MPG	0.9990	0.0053	0.000	0.3360	0.34	67,679
Constant	-0.1807	0.0178	0.000			
Hybrid Vehicles						
Test MPG	0.8956	0.0155	0.000	0.2696	0.37	5,044
Constant	0.0974	0.0608	0.109			
Diesel Vehicles						
Test MPG	0.9327	0.0199	0.000	0.2012	0.51	2,267
Constant	0.1516	0.0735	0.039			

Analysis of the residuals from all the regressions reported below using the Stata™ hettest post-estimation tool indicated that they were heteroskedastic ($p = 0.000$) and skewed towards negative values. Therefore, all regressions reported below were estimated using the Stata™ variance covariance estimation procedure for robust errors.

V. Results

The simple regression model of equation (2) was estimated to determine the average relationship between test cycle and on-road MPG for all model years of gasoline, hybrid and diesel vehicles in the sample. Model year indicator variables were then added to the gasoline vehicle regression to explore the possibility of trends in the relationship over time. Next equation (3) was estimated for each of the three types of powertrains to measure the relationship between the information provided to consumers and their own fuel economy estimates. Finally, the more general equation (1) was estimated separately for each powertrain types and then again for only those gasoline vehicles with odometer based estimates.

Test Cycle and On-Road MPG Estimates

Relationships between the logarithms of reported on-road MPG and the EPA test cycle MPG without controlling for other variables were estimated to describe the average "shortfall" for all model years and vehicles implied by the My MPG estimates. Results are summarized in Table 6. Test Cycle MPG is significant at the 0.001 level, although the R^2 values are only 0.56 to 0.68, indicating a large amount of unexplained variance.

Table 6. Log-Log Regression of My MPG Estimates on EPA Test Cycle MPG Estimates (selected variables reported)

Variable	Estimate	Standard Error	Significance Level	Root MSE	R-squared	No. Obs.
Gasoline Vehicles						
Test Cycle MPG	0.9964	0.0034	0.000	0.214	0.56	67,377
Constant	-0.1566	0.0114	0.000			
Hybrid Vehicles						
Test Cycle MPG	0.9252	0.0098	0.000	0.160	0.64	5,031
Constant	-0.0115	0.0393	0.799			
Diesel Vehicles						
Test Cycle MPG	0.9511	0.0160	0.000	0.143	0.68	2,262
Constant	0.0858	0.0605	0.156			

The coefficient of Test Cycle MPG in the gasoline regression, 0.996, indicates that a 1% increase in fuel economy on the test cycle translated, on average, into almost exactly a 1% increase in fuel economy on the road. The shortfall is determined by both coefficients. For gasoline vehicles, the estimated shortfall from EPA test cycle estimates to My MPG on-road fuel economy estimates is approximately -15%. This is virtually identical to the approximately 15% reduction specified by the EPA's 1984 adjustment procedure (Hellman and Murrell, 1984), but somewhat less than the 19% to 20% shortfalls found by Mintz et al. (1993). It is also less than the approximately 20% average adjustment stipulated by the 2008 rule (EPA, 2006).

The hybrid results imply a shortfall of about 22% at an EPA test cycle MPG of 25, increasing to 27% at an EPA test cycle MPG of 60. For diesels, the shortfall is only about 7% at an EPA test cycle MPG of 25 and grows to 10% for a vehicle with an EPA test cycle MPG of 50. Both hybrids and diesels have MSE smaller than the gasoline vehicles. Still, even for diesels, a 2*MSE band would be approximately -23% to +30% of the predicted value.

Shortfalls for each drivetrain technology are shown in Figure 4 as a function of EPA test cycle MPG. The estimates are based on the regression results shown in Table 6 and represent the average relationship between test cycle and on-road MPG over the 1984-2015 model years. No

VW FOIA, EPA 06/20/2017 2017-FFP_028055

model year effects or other variables were included in the regression. The estimated shortfalls for diesel and hybrid vehicles grow with increasing MPG, but the estimated shortfall for gasoline vehicles remains nearly constant at about 15% as MPG increases. Mathematically, this conclusion follows from the fact that the estimated coefficient of the logarithm of gasoline test cycle MPG is approximately 1.0 (0.9964). Early studies, in which carbureted gasoline engines predominated, indicated increasing shortfall with increasing MPG (e.g., McNutt et al., 1982).

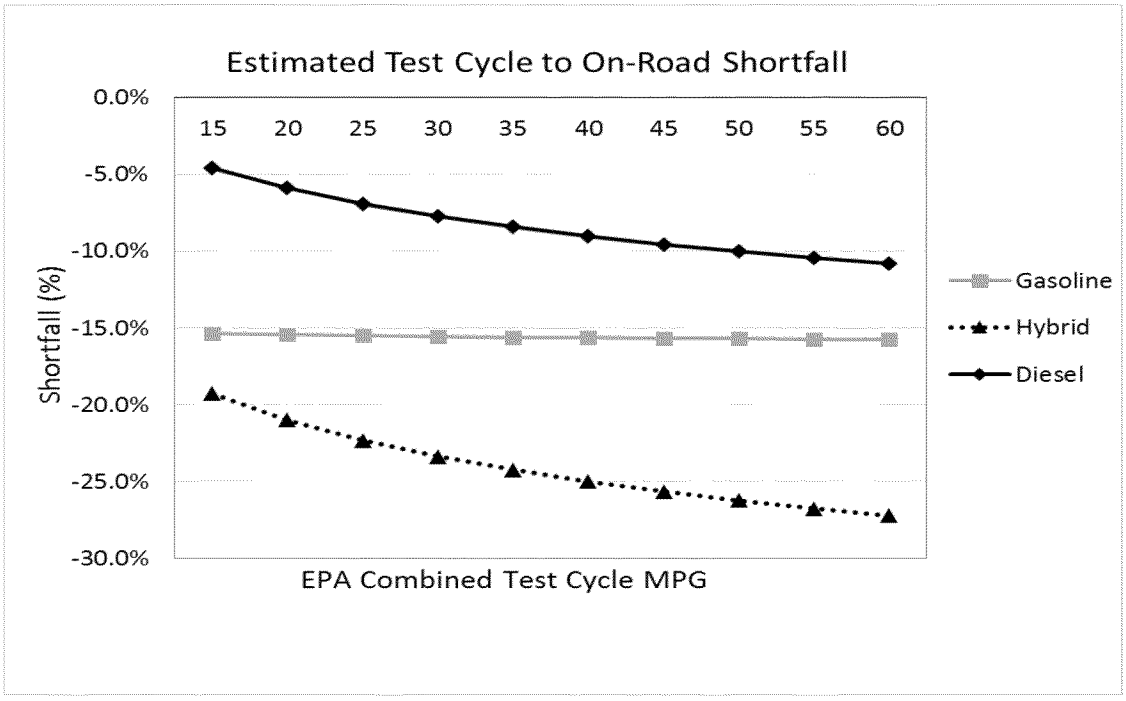

Figure 4. Estimated Shortfall as a Percentage of EPA Test Cycle MPG.

The My MPG data for gasoline vehicles indicates that the shortfall between on-road fuel economy and EPA test cycle estimates may have increased in recent years. A simple model was estimated that regressed the logarithm of My MPG versus the logarithm of EPA test cycle MPG, including model years 1984 to 2014 as indicator (0,1) variables. No other explanatory variables are included. An F-test indicated that the addition of the indicator variables was statistically significant at the 0.0001 level. The shortfall, Δ, is estimated as the ratio of the on-road MPG predicted by the model to the average test cycle MPG for light-duty vehicles reported by the EPA (2015, table 9.1) in the respective model year, minus 1. The MPG predicted by the model is the test cycle MPG raised to the power 1.042 (the coefficient of the log of test cycle MPG), multiplied by $e^{C+\delta_y}$, where C is the estimated constant term of the regression and δ_y is the estimated model year coefficient. Because the coefficient of the log of test cycle MPG is greater than 1.0, the shortfall is gradually reduced as MPG increases. The regression coefficients and related statistics can be found in the appendix.

The estimated fuel economy shortfalls for conventional gasoline vehicles by model year are shown as percent differences from the test cycle MPG in Figure 5. Upper and lower bounds based on the 95% confidence intervals of the model year coefficients are also shown. The estimated additional shortfall is very close to 15% from 1987 to at least 2006 and perhaps 2009.

VW FOIA, EPA 06/20/2017 2017-FFP_028056

In 2010 it dips close to 20%, declines to over 25% in 2013 and then rebounds to about 22% in 2014 and 2015. Although the shortfall appears to have increased abruptly in recent years it may be stabilizing close to the 20% shortfall used by the EPA and NHTSA to estimate future benefits of the fuel economy and GHG emissions standards. As noted above, studies carried out in the 1970s and 1980s estimated that the shortfall increased from 1974 to 1977 and then stabilized in the vicinity of 15% to 20%. The U.S. trend is much less extreme than comparable shortfall estimates for vehicles sold in the EU, described above (Mock et al., 2014).

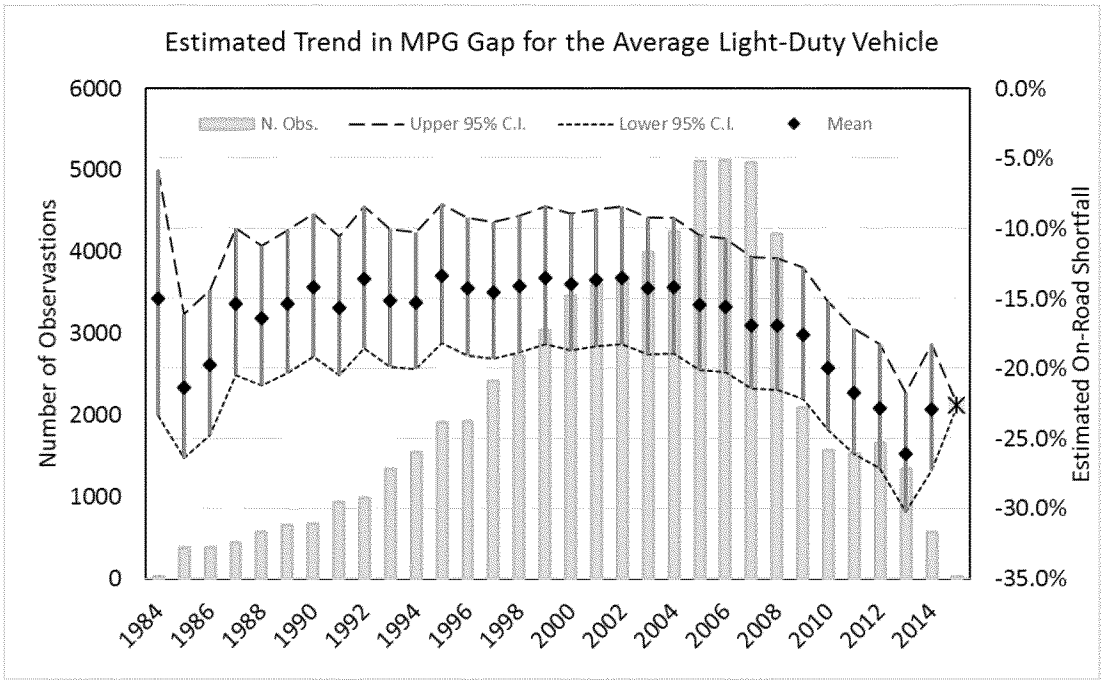

Figure 5. Estimated Fuel Economy Shortfall for Model Years 1984 to 2015.

Almost forty years ago, an apparent increase in shortfall followed the oil price shocks and gasoline shortages of 1973-74 and the adoption of the first fuel economy regulations in 1975. Similarly, the price of gasoline increased from about $2/gallon in 2004 to $3/gallon in 2008 and, after remaining nearly constant since 1985, the CAFE standards for light trucks were increased in 2005 and those for passenger cars in 2011. The timing of the increase in shortfall suggests the possibility that as standards are tightened (or gasoline prices increase) manufacturers increasingly design vehicles to perform well on the test cycle (and achieve higher label MPG), in the process increasing the gap between test cycle and on-road fuel economy. Blending of ethanol with gasoline approximately tripled between 2005 and 2011, at which point most gasoline contained approximately 10% ethanol by volume (EIA, 2015). Because ethanol has only 2/3 of the energy content of gasoline, this could increase the on-road shortfall by about 2%. The fuel economy estimates of recent model year vehicles would be based on fuel with approximately 10% ethanol while those of older model years would be more likely to be based on fuel with a lower ethanol content. Whether increasing gasoline prices or increasing fuel economy standards or ethanol use, or something else, caused the on-road gap to increase is an important topic for further investigation. Even more important is whether the gap will remain stable in the future, so that an increase in test cycle fuel economy continues to provide an equivalent percentage increase in on-road fuel economy. The apparent trend should be closely watched to insure that

VW FOIA, EPA 06/20/2017 2017-FFP_028057

the gap does not increase further. Light-duty vehicle fuel economy on the test cycle increased from 24.0 MPG in 2004 to 30.6 in 2014, about 28% (EPA, 2014b). If the shortfall increased by about 7 percentage points over the same period, about one fourth of the test cycle fuel economy gain over that period may have been offset by the increased shortfall. However, because the rulemaking calculated the benefits of the standards assuming a 20% shortfall, the implication for the projected benefits is very small provided that the gap does not continue to grow.

Label and On-Road MPG Estimates

To estimate the potential bias and variance of individual estimates around the label numbers, linear regressions of the My MPG values on only the combined adjusted (2008) EPA label values and a constant were estimated. These regressions describe the correlation between the information provided to consumers and their reported on-road MPG (Table 7).

Table 7. Linear Regressions of My MPG Estimates on EPA Combined Adjusted Label MPG Estimates (selected variables reported)

Variable	Estimate	Standard Error	Significance Level	Root MSE	R-squared	No. Obs.
Gasoline Vehicles						
Label MPG	1.1521	0.0042	0.000	5.097	0.56	67,377
Constant	-0.4568	0.0879	0.000			
Hybrid Vehicles						
Label MPG	1.0757	0.0128	0.000	6.607	0.60	5,031
Constant	-1.5189	0.4888	0.002			
Diesel Vehicles						
Label MPG	1.2519	0.0188	0.000	5.709	0.60	2,262
Constant	-0.5601	0.5787	0.333			

In the gasoline vehicle regression, the coefficient of EPA label MPG implies that the on-road MPG of My MPG participants averages about 13% better than the EPA label rating at 20 MPG and increasing to 14% better at 50 MPG. The hybrid regression results imply a smaller bias, ranging from +2.5% at 30 MPG to +5% at 60 MPG. Because the constant term is not statistically significant, for practical purposes it would be reasonable for hybrid buyers to assume that average on-road MPG will equal the EPA label MPG. However, that is true only with respect to the national average MPG. An individual's experience is likely to differ greatly from the national average, as indicated by the MSE of more than 6 MPG. Diesels average +22% above the label values at 20 MPG, increasing to 24% at 50 MPG.

The fact that the fuel economy achieved by individuals will differ from the label estimate has long been recognized. Indeed, a statement to that effect is printed on every fuel economy label. The My MPG data indicate that the differences are relatively large. For a conventional gasoline vehicle with a label fuel economy of 25 MPG, the regression results indicate that a confidence

bound of +/- 2*(root mean squared error) is +/- 40% of the label value. If a 25 MPG vehicle travels 10,000 miles per year and gasoline costs $2.50/gallon, the consumer can be 95% certain that its fuel costs will be somewhere between $600 and $1,400. Uncertainty of this magnitude can seriously hinder a consumer's ability to make informed choices about fuel economy (Greene, 2011; Greene et al., 2013).[11]

Factors Correlated with On-Road MPG

The following sections describe the results of an expanded regression analysis, including additional variables describing vehicle technologies and driver attributes, as shown in equation 1. As in equation 1, all the expanded models regress the My MPG estimates against the test cycle MPG estimates and other variables. Key results are highlighted in the following sections. Full listings of coefficient estimates and related model statistics for the regressions are provided in an appendix to the report.

Gasoline Internal Combustion Engine Vehicles

This section describes the results of the expanded regression on the subset of vehicles with conventional gasoline engines. Because test cycle fuel economy is one of the explanatory variables, the coefficients of the technology and driver variables do not measure their total impact on fuel economy but instead measure impacts on on-road fuel economy relative to the test cycle. A positive coefficient indicates that a technology increases on-road fuel economy relative to the typical on-road vs. test cycle relationship. A negative coefficient indicates on-road performance that is below average. For example, a technology that increased fuel economy by 5% on the test cycle but only 4% on the road would have a coefficient of about -0.01. The coefficient of -0.01 represents a 1 percentage point increase in the average shortfall, say from 15% to 16%.

When additional variables are included, the coefficient of test cycle fuel economy has a mean value of 0.74, with a 95% confidence interval of 0.72 to 0.76, indicating that a 1% increase in test cycle fuel economy corresponds to a 0.74% increase in on-road fuel economy, all else being equal. Other factors are not equal, however, and they have a substantial influence on on-road fuel economy. Vehicles with larger displacement engines do slightly worse on the road: a doubling of engine size reduces on-road performance by about 2.6% relative to the test cycle.[12] Vehicles with continuously variable transmissions (CVT) appear to get about the same miles per gallon on the road relative to their test values as vehicles with conventional transmissions. Manual transmissions do about 6.9% better than automatics in real world driving. Turbocharged engines are estimated to add about 1.7% to the on-road shortfall in comparison to naturally

11 An important, unanswered question is whether car buyers assume a high degree of correlation among fuel economy estimates for cars they are considering buying. This may depend on whether deviations from label fuel economy ratings are strongly correlated for vehicles owned by the same household. This issue is not analyzed in this report. Further analysis of the odometer and miles data are planned and may shed some light on this question.

12 All the results reported in this section have a level of statistical significance of 0.05 or better, except where noted otherwise. Detailed results may be found in the appendix.

aspirated engines. The shortfall for turbocharged pickups is about 6% larger, a result that is consistent with a recent study by AAA (2015) also based on the My MPG data. However there were a relatively small number (67) of turbocharged pickup trucks in the dataset. On the other hand, the 542 turbocharged SUVs in the dataset do not show a statistically significant increase in their on-road shortfall, suggesting that the pickup effect may be a result of differences in usage (e.g., towing and hauling). Vehicles with higher gear counts appear to have a somewhat reduced shortfall but this result has a significance level of only 0.094. Four-wheel drive performs about 1.8% worse on the road while front wheel drive does about 1.3% better. With the exception of manual transmissions, none of the technology impacts are greater than 3%, indicating that the test cycle results are not strongly biased relative to on-road performance by these technologies.

Driving style matters. The estimated coefficients are relative to the style of the majority of observations which do not include a description of driving style.[13] If the observations without an indication of driving style have driving styles similar to those that do, the driving style coefficients can be interpreted as differences from the typical driver. Drivers who described themselves as driving "for maximum fuel economy" or "more cautiously than most," reduced their on-road short-fall by about 12% in comparison to those who chose "accelerate quickly and pass whenever possible" and by 8-10% relative to the average driver. The benefit of the more cautious driving styles closely matches other estimates of what an average driver can achieve by "eco-driving" (Greene, 1986; Kurani et al., 2013; IEA, 2005; Kurani et al., 2005).

There are a few statistically significant effects associated with manufacturers, but they combine the unobserved effects of driver behavior and environment with the design and manufacture of the vehicles. In general, manufacturer effects are small. The estimated coefficients range from 2.7% to 5.1% decreases in on-road performance for Ford, Chrysler, Nissan and Hyundai vehicles to zero effects for GM, Honda, Toyota and Volkswagen, to 0.7% to 1.5% increases for BMW and Daimler. Again, it is not possible to attribute these effects to a vehicle's design and manufacture since they include unknown effects of behavior and environment.

Vehicle class effects (measured relative to compact cars) tend to be larger, with light trucks having greater shortfalls than passenger cars. The coefficients of minivans, SUVs, pickups, vans, and special purpose vehicles imply increased shortfalls of 6.4% to 11.5%, in comparison to compact passenger cars. Once again, the estimated effects cannot distinguish effects due to the way the vehicles are used (e.g., towing, hauling or off-road operation) from how they are designed.

In the expanded regression model the only model year effects significant at the 0.5 level are associated with the oldest two model years (1985, 1986) and model year 2013. Nonetheless, an F-test indicated that the model year effects, taken as a whole, are statistically significant at the 0.0001 level. The estimated effects for the oldest vehicles may reflect differences in usage patterns (e.g., shorter trips) and mechanical performance due to the age of the vehicles as much

13 The option to specify driving style was added in 2007 after the My MPG system had been in effect for several years. Thus, early participants did not have the opportunity to indicate their driving style.

VW FOIA, EPA 06/20/2017 2017-FFP_028060

as model year specific effects. In general, the data do not indicate a deterioration of on-road fuel economy performance with age over the typical 15-year lifespan of a light-duty vehicle (Figure 6). Although most year effects are not individually statistically significant, the pattern of the model year coefficients is similar to that in Figure 5 which suggests the possibility of an increasing shortfall in the more recent model years when fuel economy standards have been increasing (Figure 6). Because these coefficients are generally not close to being statistically significant, conclusions cannot be drawn about their meaning. Considered together with the model year effects described above, this result suggests that the apparent increase in shortfall shown in Figure 5 can be statistically explained in part by the additional technology, vehicle class, and other variables included in the expanded regression model.

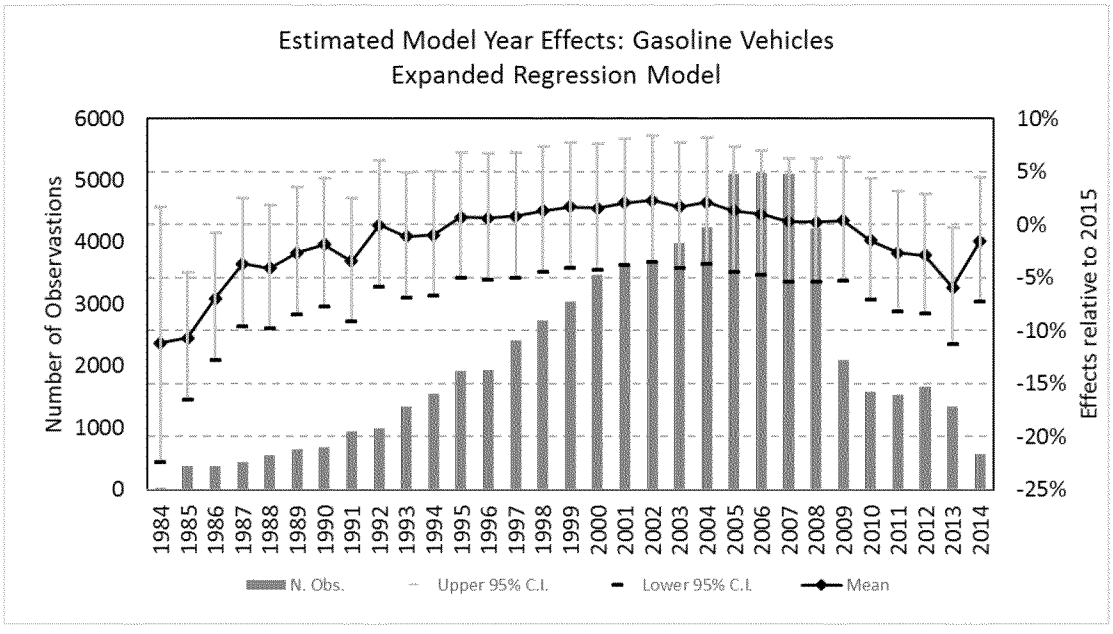

Figure 6. On-road Fuel Economy Performance Compared with Vehicles of 2015 Model Year

All but ten state effects are statistically significant at the 0.05 level. A positive state effect indicates that the shortfall in that state is less than the default shortfall. The default is no state specified, and nearly all states with statistically significant effects have effects that are greater than zero (CA, DC and HI are exceptions). The state effects represent a combination of impacts on fuel economy that vary geographically, including temperature, traffic congestion, speed and trip length. Because some factors reduce the on-road shortfall (e.g., longer trip lengths, mild temperatures) while others increase it (e.g., congested driving conditions, cold weather) it is difficult to discern consistent patterns in the state effects (Figure 7).

VW FOIA, EPA 06/20/2017 2017-FFP_028061

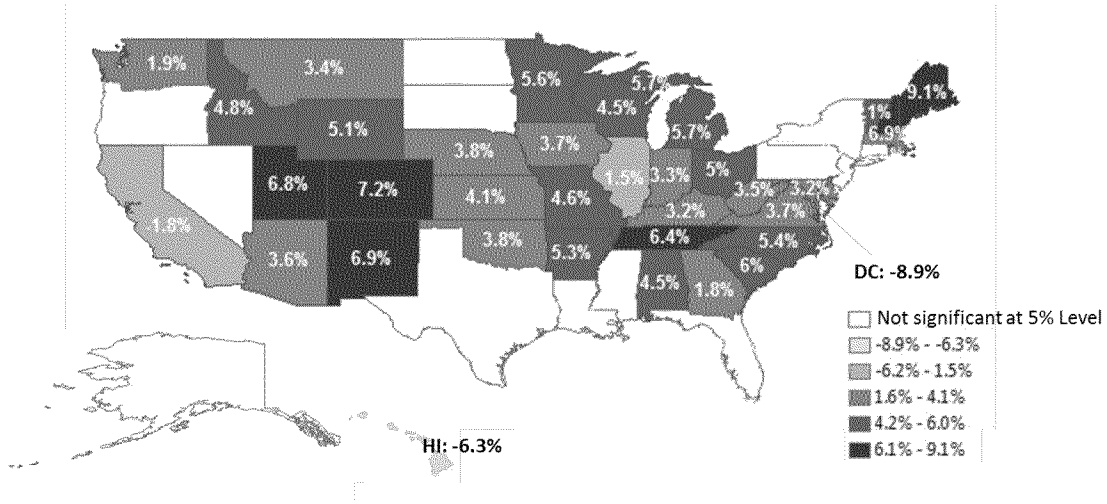

Figure 7. Estimated State Effects: Gasoline Regression Model

The impact of method of estimation is interesting in part because, like the effect of driving style, it is indirectly related to the issue of self-selection bias. Differences among estimation methods could reveal tendencies for those reporting MPG numbers to "self-enhance" in order to appear achieve better than expected fuel economy. Four methods of estimation were represented in the model:

1. Dash: MPG estimate obtained from a vehicle's dashboard display.

2. Miles: MPG estimated by dividing miles between fill-ups by gallons purchased. Participant supplies miles between fill-ups but not odometer readings.

3. Odometer: MPG estimated by fueleconomy.gov by subtracting the odometer reading at the current fill up from the reading at the previous fill up and dividing by gallons purchased at the current fill up. Most records consist of multiple fill ups and MPG is calculated as the sum of miles divided by the sum of gallons.

4. Math: MPG calculated by customer using own, unspecified method.

In the regression the default method is "did not answer", "other" or "guess". About 2.4% of the sample is in this category

Because of the error checking provided by www.fueleconomy.gov during the entry of odometer data, and because of the additional error checking performed for this study, the odometer and miles methods are believed to be the most reliable methods. In theory, the miles-based diary method should produce results similar to the odometer method, since both should be based on the same data: fuel purchases and miles traveled between fuel purchases. This seems to be the case. The estimated effects of the miles and odometer methods are close to each other, relative to the other methods. The "Odometer" method effect is statistically different from zero (at 2.1%), i.e., from the default category, although the "Miles" method effect is not. The effect of using a dashboard estimate is approximately 6.7% higher fuel economy than the default, while the "Math" method produces about 5.6% higher estimates.

VW FOIA, EPA 06/20/2017 2017-FFP_028062

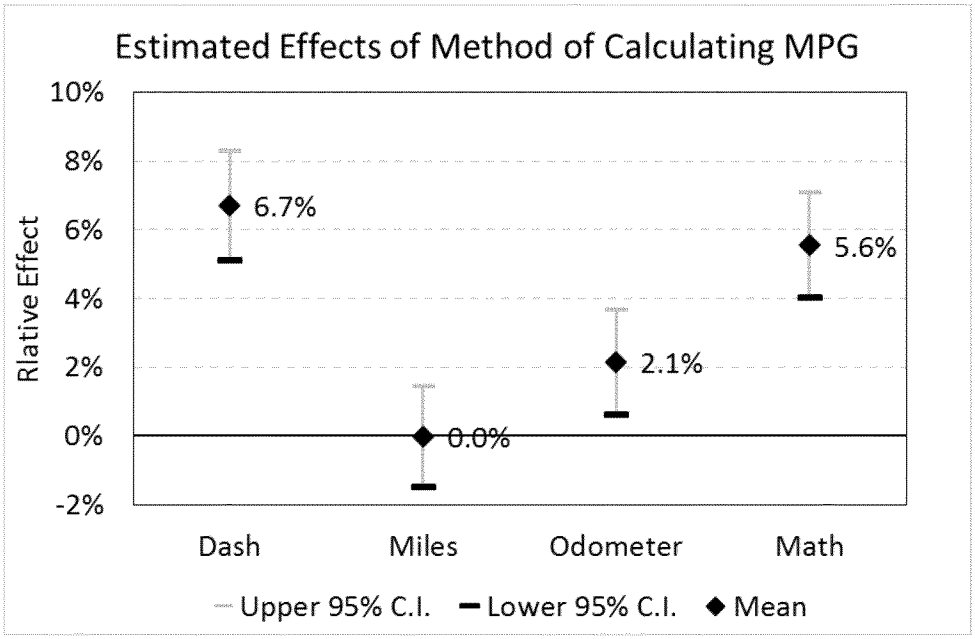

Figure 8. Estimated Effects of Method of Calculating MPG

Even after taking all the above factors into account, the unexplained variance in the My MPG estimates for conventional gasoline vehicles is substantial. A two MSE confidence interval would be +49% to -33% of the predicted value. For a vehicle with a predicted fuel economy of 25 MPG, the two MSE interval would be 17 to 37 MPG.

Following the discussion of results for hybrids and diesels, we report estimates based only on the odometer sample of conventional gasoline vehicles (12,268 records) for comparison with the full sample. A more detailed analysis of the odometer and miles-based data is planned for future study.

Hybrids

The usable sample of hybrid vehicles for the expanded regression is much smaller, 4,807 records, but it includes all years in which hybrids were sold in the U.S. from 1999 to 2015. The coefficient of test cycle MPG is smaller for hybrids than for gasoline vehicles: 0.67 vs. 0.74. The effect of (internal combustion) engine displacement is greater for hybrids: for every 10% increase in displacement fuel economy decreases by an average of 4.6%. The coefficient of CVT, is positive at 2.9%. The effect of a manual transmission is surprisingly large, a 13 percentage point reduction in the test cycle to on-road MPG shortfall; however, the early Honda Insights predominate in this group. Turbocharged hybrids are estimated to have a 20 percentage point greater shortfall but few hybrids are turbocharged. The effect of six or more gears is not significant. Four wheel or all-wheel drive vehicles have a 2.5 percentage point larger shortfall.

The effect of driving style is similar to that for gasoline vehicles. This may be surprising since many believe that hybrid vehicles are more sensitive to driving style than conventional gasoline vehicles. Like the drivers of conventional gasoline vehicles, those who drive "more

VW FOIA, EPA 06/20/2017 2017-FFP_028063

cautiously than most" or "for maximum fuel economy" get 10% to 12% better fuel economy than those who "accelerate quickly and pass whenever possible".

Relative to compacts (the default vehicle class), two-seater (mostly Honda Insights), do about 11% better on the road. SUVs are estimated to have about 9.7% larger shortfalls and large cars 7.4% larger shortfalls. Most manufacturer effects are not statistically significant. Most of the model year and state fixed effects are not statistically significant, in part reflecting the smaller sample size.

With respect to the methods of estimating MPG for hybrids, none of the method effects are statistically significantly different from zero.

Diesel

The diesel sample for the expanded regression is even smaller than the hybrid sample, totaling 2,116 usable records. As a consequence there are many fewer statistically significant variables. The coefficient of test cycle MPG is only 0.62, indicating that on-road fuel economy increases more slowly with test cycle fuel economy than for gasoline vehicles, other things being equal. Vehicles with manual transmissions have a smaller shortfall by 5.4 percentage points, but none of the other technology coefficient estimates are statistically significant. The effect of driving style on diesel fuel economy is smaller than that for gasoline vehicles with the most efficient two styles getting 6% to 7% better on-road fuel economy than the most inefficient. For diesels, the effect of the odometer method is also not significantly different from the miles method. Those basing their estimates on dashboard readouts report about 10% higher fuel economy relative to their test cycle numbers than those using the odometer method. Among vehicle classes, pickups and vans are estimated to have significantly greater shortfalls: -17% and -38%, respectively. Again, usage patterns are likely an important reason for the increased shortfall. Only one manufacturer effect is significant at the 0.05 level. None of the model year effects was statistically significant at the 0.01 level.

Odometer Sample for Gasoline Vehicles

The expanded model was re-estimated on the subsample of gasoline vehicles using the odometer record (12,268 usable records). The coefficient of test cycle MPG was slightly smaller 0.68 vs. 0.74. The estimated coefficients of most other technology variables were similar, although fewer were statistically significant. Four of the five driving style coefficient estimates were significant (relative to no answer). Again, the self-described fuel economy maximizing and more cautious groups did about 9% to 10% better than the most aggressive drivers. Most vehicle class effects were significant and, again, passenger cars had somewhat smaller shortfalls than light trucks.

The odometer data show a trend of increasing shortfall in model years that is very similar to the full gasoline vehicle sample (Figure 9). Like the full gasoline sample estimates, the effects are relative to 2015. In general, the individual model year effects are not statistically significant but the combination of all model year effects is statistically significant at the 0.003 level. Individually, only the effect for 1998 appears to be statistically significant. When compared with the statistically significant model year effects illustrated in Figure 5, this result and that for

VW FOIA, EPA 06/20/2017 2017-FFP_028064

the full gasoline sample indicate that the variables included in the expanded regression model explain much of the increase in on-road shortfall since 2004 or 2005.

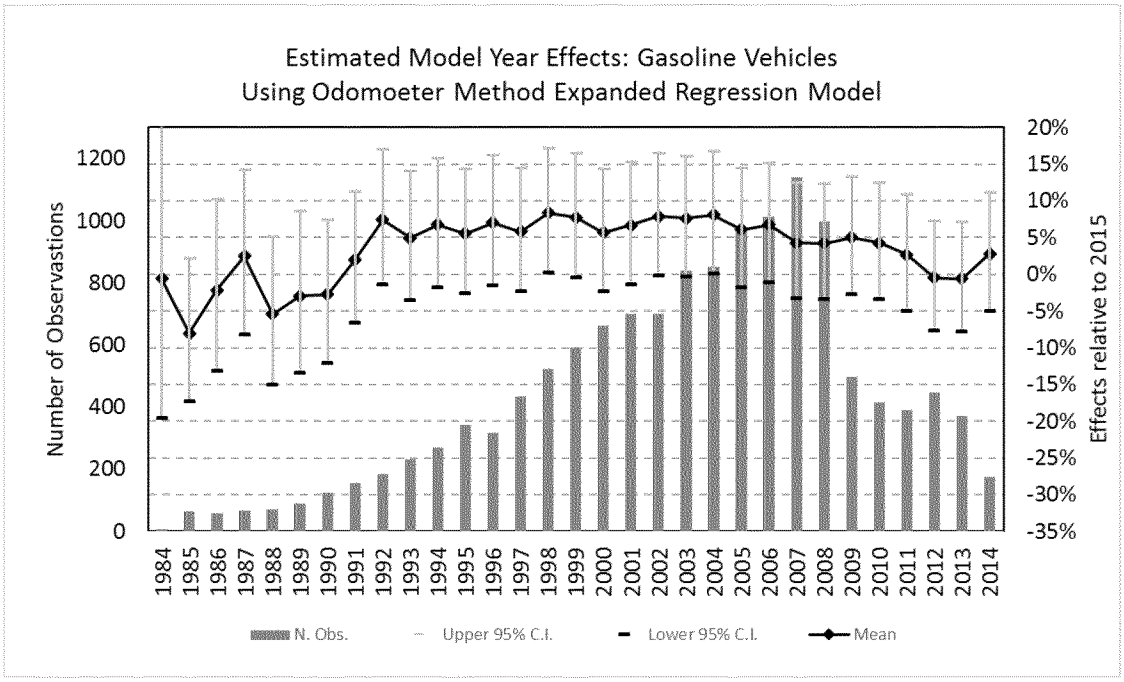

Figure 9. Estimated Fuel Economy Shortfall, Odometer Records: 1984-2014.

V. Conclusions

Perhaps the most important conclusion that can be confidently drawn from the My MPG data is that the variance of the fuel economy estimates reported by individuals is very large relative to the EPA MPG estimates for their vehicles. This conclusion is almost certainly valid whether the My MPG dataset is biased by self-selection or whether some individuals' estimates are inflated by self-enhancing behavior. A very large fraction of the variation in individual estimates could not be accounted for by the vehicle and driver variables included in our full regression models. As Greene et al. (2007) and Lin and Greene (2011) observed, it appears that the EPA MPG estimates are not strongly biased in comparison to the average fuel economy of all drivers, but that the estimates of individual drivers vary widely around the label estimates. This is to be expected given the variations in driving behavior, traffic conditions and other factors. Nonetheless, it reduces the value of fuel economy information in car buying decisions and could be an important explanation for why car buyers appear to undervalue fuel economy in car buying decisions (Sallee, 2013; Greene et al., 2013).

Modern information technology may offer a way to develop individualized fuel economy estimates. The information available from a modern vehicle's computer control system could be combined with existing information technology to generate individualized driving cycles. Driving cycles for individual motorists could be used with vehicle simulation models, calibrated to individual vehicles, to develop personal fuel economy estimates for both new and used

VW FOIA, EPA 06/20/2017 2017-FFP_028065

vehicles. While it is not clear how much estimation errors could be reduced, we believe this is an important area for future research that has the potential to enhance the value of fuel economy information to consumers.

The simple gasoline, hybrid, and diesel regression models indicate that, on average, a 1% increase in test cycle fuel economy has translated into very nearly a 1% improvement in on-road MPG. This is important because it indicates that relative improvements on the test cycle have produced equal relative improvements in on-road MPG. However, simple regressions including fixed effects for recent model years suggest that the test cycle vs. on-road gap has been growing in those years in which fuel economy standards have been increasing. Taken at face value, these results suggest that roughly one-fourth of the gain on the test cycle may have been offset by an increased gap. However, the impact on the fuel consumption and greenhouse gas reductions estimated for the standards is very small because the EPA rulemaking assumed the gap had increased from 15% to 20%. On the other hand, model year effects estimated using the expanded model, whether based on the full gasoline vehicle sample or just those using the odometer method, do not show such a large increase in the shortfall. This suggests that the technology, vehicle class and other variables included in the expanded model explain most of the increased shortfall. Given the limitations of the sample design, the evidence for an increasing gap in the U.S. is not definitive and will have to be resolved by future research.

Driving style affects real-world fuel economy. Those who describe themselves as driving cautiously or attempting to maximize their fuel economy get about 10% more miles per gallon than average or aggressive drivers.

Turbo-charged engines appear to achieve slightly lower fuel economy in the real world than would be predicted based on their test cycle numbers. The same applies to 4-wheel drive vehicles and those with larger engines. The increases in the shortfall are small, however. In general, the on-road shortfalls for light trucks are greater than those for passenger cars. How much of this is due to how the vehicles are driven versus design and technological factors is not known.

Although the data analyzed in this report are based on a self-selected sample, there are reasons to believe that the inferences drawn from it may be reliable. First, the distribution of vehicle types in the sample is generally similar to that of the vehicle fleet as a whole. Second, the vast majority of drivers do not describe themselves as driving to maximize fuel economy or even as driving more cautiously than most. Third, the statistical inferences based only on the data from drivers using the most rigorous odometer method are not generally different from those using other methods. Fourth, the estimates of the MPG shortfall, technology effects and driving style effects are generally consistent with the existing literature.

Nevertheless, the importance of fuel economy numbers for the enforcement of CAFE and GHG emissions standards and for informing car buyers' decisions, together with the unresolved issues raised by this analysis, point to the need for further research. The authors plan to carry out a more detailed analysis of the odometer data to investigate how fuel economy varies over time, how errors relate to the length of the odometer diary record, and possible correlations among

VW FOIA, EPA 06/20/2017 2017-FFP_028066

vehicles owned by the same household. Unfortunately, even this more detailed analysis will be limited by the sample design.

Ultimately, a new scientifically designed survey of in-use fuel economy is needed to insure that an unbiased sample is collected and that fuel economy is rigorously and consistently measured for all vehicles. In 2011 Transport Canada launched a Canadian Vehicle Use Study to measure the on-road fuel economy of Canadian vehicles by means of automated data loggers connected to each vehicle's computer system (Transport Canada, 2015). With lessons learned from the Canadian experience, the U.S. may be able to develop efficient and scientifically rigorous methods for measuring the relationship between test cycle fuel economy and consumers' experience in real world driving.

Subject: VW case - Request for information

Dear Karl,
First of all I hope you are well.
Please find attached a letter signed by my Director general, accompanied by a translation in English.
As you can see we are looking for some help about the detection of defeat devices, you experienced in the VW case
I am not sure you are the right person to be contacted. If this is not the case I would be grateful if you could forward this note to the competent office
Thank you in advance
Regards
Antonio Erario

Oggetto : Richiesta di informazione in merito alla non conformità alle normative USA di alcuni veicoli per ciò che concerne le emissioni inquinanti.

Questa Amministrazione è stata recentemente informata in merito ai risultati delle verifiche condotte da codesta Agenzia su alcuni modelli di autovettura del costruttore Volkswagen.

In particolare, sembrerebbe che i veicoli oggetto del controllo non siano risultati conformi alle normative sulle emissioni da gas di scarico vigenti negli USA e che il costruttore abbia fatto ricorso all'impiego di strategie elettroniche in grado di permettere al veicolo di superare le prove di laboratorio, in sede di certificazione.

Al riguardo, questa Amministrazione, esprime preoccupazione in merito all'accaduto, in relazione alla protezione dell'ambiente ed alle possibili ripercussioni di quanto accaduto sul sistema legislativo vigente nell'Unione europea.

Per tale ragione nei prossimi giorni è nostra intenzione avviare una campagna di prove di laboratorio e su strada al fine di verificare se vi siano altri modelli di veicoli diesel che presentino le stesse non conformità riscontrate negli USA.

Ciò premesso, si sarà grati se codesta Agenzia vorrà fornire informazioni più dettagliate in merito al tipo di verifiche effettuate sui veicoli del gruppo VW che hanno permesso di riscontrare le anomalie sopra citate; ciò sarebbe molto importante per questa Amministrazione al fine di poter organizzare proprie sessioni di prove utili a evidenziare possibili non conformità dovute all'impiego di dispositivi di manipolazione

Si ringrazia per la collaborazione.

Subject: Request for information about the non-compliance of some vehicles with US emissions standards.

Dear Sir,

This Administration has recently been informed about the results of checks carried out by your Agency on some vehicles manufactured by Volkswagen.

In particular, it would seem that the vehicles inspected did not meet the US emission regulations and that the manufacturer made use of electronic strategies allowing the vehicle to pass the laboratory tests, at the time of certification.

In this regard, this Administration, expresses its concern, in relation to the environmental protection and the possible implication on the legal system in force in the European Union.

For this reason, in the coming days we intend to launch a campaign of laboratory tests as well on road tests in order to check whether there are other models of diesel vehicles showing the same non-conformities detected in the USA.

In this respect, we will be grateful if you could provide more detailed information on the type of checks carried out on vehicles of Volkswagen which made it possible to detect the anomalies mentioned above; this would be very important for our Administration to be able to organize our test campaign with the aim to detect possible non-compliance due to the use of defeat devices.

Thank you for your cooperation.

Regards

Maurizio Vitelli
Director General

Cc: Allen.Laura@epa.gov
Subject: RE: Re:Your story- one clarification

> Jeff, here are responses to questions you posed earlier. Hoping this helps. Let us know if you're able to update/clarify your statement that EPA is wary about doing more on the road tests. And if not, let us know what specifically makes you think we are wary.

> So you're saying the agency is now testing EVERY light-duty diesel vehicle for defeat devices? This isn't just a few spot checks on cars borrowed from owners or taken off factory assembly lines? It is a systematic, on-the-road evaluation of every diesel car or light truck using portable emissions measuring equipment?

> The Agency is doing two things. In partnership with the California Air Resources Board (CARB) and Environment Canada (EC), the agencies will be testing every unique light-duty diesel vehicle model to screen the vehicles for potential defeat devices similar to Volkswagen. To be absolutely clear, we don't mean literally every diesel vehicle that comes off of an assembly line but rather representative samples of every unique diesel engine and emission system combination. Secondly, last week, we informed automakers that we are implementing new tests to complement our existing test procedures that will apply to vehicles we test at the National Vehicle and Fuel Emissions Laboratory at part of our confirmatory test programs. We are not revealing to the automakers how we will be conducting either of these test programs. We can say the tests we will be applying are designed to detect the kind of defeat device implemented by VW.

Also, is it a fair characterization to say the agency is open to additional changes to the testing program if warranted?

Yes as we said on Friday, the agency has in the past and will continue to adapt its compliance program to help deliver the environmental benefits of our regulatory programs.

And isn't it true that road checks are costly? The ICCT says it spent $75,000 on its study that triggered the VW investigation, and that only covered three cars. Is there anything you can say about the cost, like the current EPA budget is sufficient to cover it, if that's accurate?

The additional tests are being conducted at EPA's National Vehicle and Fuel Emissions Laboratory (NVFEL) using existing facilities and staffing at EPA. The Agency has the resources to conduct this additional work but will of course then not be able to execute other compliance investigations with the allocated staffing and facilities. EPA constantly retargets compliance oversight resources both to address greatest air quality concerns and to establish a visible compliance presence among all the industry sectors we oversee. EPA also makes full use of its regulatory partnerships, especially with the California Air Resources Board and Environment Canada, to more broadly oversee regulatory compliance.

Subject: RE: Re:Your story- one clarification

Jeff- We are working on getting together information for the questions you sent earlier so you have a more full picture moving forward. However, we feel strongly that the word "wary" should be removed as it is not accurate. You alluded to the fact that the agency is not wary of doing more on the road tests in the recent paragraph that you sent from the press call. This supports the update that I am looking for.

We are "upping our game." Today we are putting vehicle manufacturers on notice that our confirmatory testing is now going to include additional evaluations designed to look for potential defeat devices. We aren't going to tell them what these tests are, they don't need to know. They only need to know we will be keeping their vehicles longer and driving them more. We will be continuing to review with our partners at the California Air Resources Board what we can learn from this VW case and will adapt and improve as we always have to ensure we deliver on the Agency's mission.

AND Chris Grundler also said this during the press call, which further supports that we are "upping our game" and not "wary" of doing more on road testing:

But technologies evolve and circumstances change, and we are continuously looking at ways to improve our compliance and oversight programs. In the past, we have added new procedures, like high-speed driving and air-conditioning use, to ensure our lab tests better replicate real-world driving conditions. And we will continue to adapt. As EPA Administrator McCarthy said a few days ago, we are "upping our game." Today we are putting vehicle manufacturers on notice that our confirmatory testing is now going to include additional evaluations designed to look for potential defeat devices. We aren't going to tell them what these tests are, they don't need to know. They only need to know we will be keeping their vehicles longer and driving them more. We will be continuing to review with our partners at the California Air Resources Board what we can learn from this VW case and will adapt and improve as we always have to ensure we deliver on the Agency's mission.

We'll get you the info you requested asap but please let us know if this is enough to update. Thank you!

Subject: Re:Your story- one clarification

Laura:

The initial response from editors is that there isn't enough to justify correcting or updating the two-day-old story.

If you can respond to the follow-up questions I sent in the earlier e-mail back to you, let me know. If there's new information that adds to the picture of how the revised test program will work, that may cause us to reevaluate. It could also lead to a new story emphasizing how the EPA changes could be more effective at catching cheating.

And if Chris wants to do a quick interview, that would definitely lead to a new story.

If you want to press for the correction or the update immediately, here's my editor's contact information: jmorgan987@bloomberg.net or 202/654-7370.

Subject: AIR POLLUTION: Exemption may stymie criminal case against Volkswagen

AN E&E PUBLISHING SERVICE

AIR POLLUTION:
Exemption may stymie criminal case against Volkswagen

Published: Wednesday, September 30, 2015

Federal prosecutors may face challenges in bringing criminal charges against Volkswagen AG over its role in an emissions testing scandal because of exemptions in the Clean Air Act.

No automaker has ever faced criminal charges for skirting emissions standards. In part, that's because of a carve-out from criminal penalties inserted in the Clean Air Act of 1970 by industry-friendly lawmakers. That could force prosecutors to turn to other criminal statutes, such as charging Volkswagen with lying to regulators.

Sen. Richard Blumenthal (D-Conn.) pledged to introduce legislation to close the exemption. Rep. Fred Upton (R-Mich.), chairman of the House Energy and Commerce Committee, has called for hearings on the matter.

Former Rep. John Dingell (D-Mich.), a supporter of the auto industry who helped pass the Clean Air Act, said it was appropriate to focus on civil penalties.

"It's easier, speedier, quicker," Dingell said.

Volkswagen will still face significant enforcement action, he said.

"The cost to Volkswagen is going to be unbelievable," Dingell said. "The risk of them going out of business is very real" (Harder/Viswanatha, ***Wall Street Journal***, Sept. 29). **-- SP**

Hi,
For help with Volkswagen inquiries before Monday morning, please resend your email to press@epa.gov. And please include "Volkswagen" or "VW" at the beginning of your subject line.

I will be happy to get back to all other requests on Monday.

Thanks.

Subject: Jeep Renegade 2.0 Multijet - exceeds NOx by 10 times

Dear Meetu,

At Sep 18 you notified Volkswagen AG and Audi AG that some of their Diesel cars were equipped with software based defeat devices – and consequently submitted between 5 to 40 times more NOx than permissible by Tier2-Bin5.

I am not really sure you are aware of it, but: In the ICCT test the (European Version) of the Jeep Renegade 2.0 Multijet exceeds the NOx by 10 times! If the U.S. and Euro versions of the Jeep are identical then seemingly Jeep should be seen in violation as well. According to the ICCT it also seems that some Volvo and Nissan cars are even WAY worse than the Jeep.

Question: Do you actively follow this up? Obviously the defeat device is devilish and needs to be punished – and obviously Volkswagen has the largest market share in Diesel cars in the U.S. – but what if other car makers are in violation, too?

I am German, see me as "concerned citizen".

Enviros Score Major Win In Final EPA Effluent Rules

The U.S. Environmental Protection Agency's tough new rule for wastewater handling at steam power plants strays considerably from methods it endorsed in a proposed version, a move experts say is a clear win for environmentalists and another setback for America's fossil-fuel energy providers.

DC Circ. Won't Reconsider Clean Power Plan Ruling

The D.C. Circuit refused Tuesday to revisit its ruling allowing the U.S. Environmental Protection Agency's controversial proposed rule to slash greenhouse gas emissions at existing power plants to proceed, simultaneously denying the energy industry's and various states' requests to delay implementing the decision.

States, Industry Get BLM Fracking Rules Blocked

The U.S. Bureau of Land Management's new rules governing fracking on federal and tribal land took another hit Wednesday when a Wyoming federal judge granted a preliminary injunction that bars enforcement of the rules until the legal dispute plays out.

Pa. High Court Wants Pollution Eyed In Harley Tax Fight

The Supreme Court of Pennsylvania ruled Tuesday that environmental contamination must be considered when assessing a property's value and booted back to trial court a dispute over the assessment of a 230-acre piece of property owned by Harley-Davidson Motor Co. that was previously used for manufacturing weapons.

EPA Tightens Regs On Power Plant Wastewater Discharges

The U.S. Environmental Protection Agency on Wednesday finalized a rule that sets the first federal limits on the levels of toxic metals in wastewater that can be discharged from power plants, including mercury, lead and selenium.

Shell Reversal Puts Alaskan Arctic Drilling In Deep Freeze

Royal Dutch Shell PLC's decision to wave the white flag on its Arctic Ocean drilling plans is a sign that the region will remain undeveloped for the foreseeable future, especially as the plunge in oil prices makes companies skittish about investing in lengthy and expensive projects.

End May Be Nigh For 'Epic' Sacred Tribal Lands Drilling Row

A nearly three-decade battle with the government over Solenex's oil and gas drilling plans on federal lands sacred to the Blackfeet Nation could finally be forced to a resolution by a D.C. federal judge, but the company says a proposed government timetable could delay that resolution even further.

Nationwide VW Class Action Faces Long Road To Certification

The unlikely tag team of Quinn Emanuel Urquhart & Sullivan LLP and Hagens Berman Sobol Shapiro LLP have filed a 500-page proposed class action over Volkswagen's "defeat device" software designed to outwit emissions tests, but experts say differences in state law and individual consumers' reliance on the embattled automaker's advertising could impede nationwide class certification.

POLICY & REGULATION

Army Corps Disavows Staff Criticism Of Clean Water Rule

The U.S. Army Corps of Engineers testified before a Senate subcommittee Wednesday that earlier criticisms from its senior staff rebuking its collaborative process with the Environmental Protection Agency to draft the controversial Clean Water Rule are not indicative of the Corps' final support for the rule.

Pa. Gov. To Sign Bill Encouraging Mine Water Use For Fracking

Pennsylvania Gov. Tom Wolf supports a bill encouraging the use of treated mine water in natural gas drilling operations, which headed to his desk Wednesday after clearing both chambers of the General Assembly, his spokesman said.

ENFORCEMENT

EPA Reaches $55M Deal For Cleanup Of LA Superfund Site

The U.S. Environmental Protection Agency on Wednesday reached a $55 million settlement with Shell Oil Co. and the U.S. General Services Administration to clean up contaminated soil at the Del Amo Superfund site in Los Angeles, which is needed to prevent environmental damage from chemicals and address groundwater contamination.

Texas' Harris County lobbed a $100 million environmental suit against Volkswagen AG on Tuesday accusing it of using software to thwart emissions tests for its "clean diesel" vehicles, which the county attorney says is the first government lawsuit in connection with the emissions scandal.

LITIGATION

TransCanada To Drop Keystone XL Eminent Domain Suits

TransCanada Corp. on Wednesday said it will drop courtroom fights it was using to clear a path for its Keystone XL pipeline in favor of pursuing the issue at the Nebraska Public Service Commission, as many opponents of the pipeline and the law facilitating it have sought.

Fla. Appeals Court Again Rejects 'Novel' Takings Claim

A Florida appeals court on Wednesday affirmed its earlier ruling upon rehearing of a group of Miami-Dade County landowners' claims against the South Florida Water Management District, saying that it would not adopt a new standard for unconstitutional takings they presented.

EXPERT ANALYSIS

A New Model For Clean Energy: Community Solar Gardens

Community solar gardens offer substantial cost benefits over traditional residential solar panels. Members of solar gardens may qualify for certain federal and state tax benefits if the solar garden investment is correctly structured and the size of a solar garden renders it better able to achieve economies of scale, say attorneys at K&L Gates LLP.

Pope Francis And Pro Bono Publico

Listening to Pope Francis last week as he made his way from Washington to New York to Philadelphia, one could be forgiven for imagining he was a poverty lawyer in robes. Again and again, he shone light on challenges that pro bono lawyers have wrestled with for years, including the death penalty, housing and homelessness, immigration and even climate change, say Kevin Curnin and Jennifer Colyer of the Association of Pro Bono Counsel.

LEGAL INDUSTRY

Most Feared Plaintiffs Firm: Cohen Milstein

Since the financial crisis, Cohen Milstein Sellers & Toll PLLC has emerged as a leader in mortgage-backed securities litigation, returning nearly $2 billion to investors, as evidenced by a record-setting $500 million class action settlement with JPMorgan Chase over the sale of MBS.

How To Boost Your Chances Of A Raise In 2016

Raises are one of the most hotly anticipated moments of the year for many associates. Some can rest easy knowing a salary bump is more or less a given, but others face pressure to prove their value with their billable hours and to explain what they've done for their firms lately. Here, legal industry insiders offer advice to help associates position themselves for a raise in 2016.

Dewey Jury Eyes Conspiracy As Deliberations Progress

The jury in the trial of the former heads of Dewey & LeBoeuf LLP on Wednesday asked a New York judge to explain the elements of the conspiracy charge against the defendants, as deliberations stretched into the ninth full day.

3 Signs Your Firm Leaders Are Misbehaving

With a trio of former BigLaw executives' alleged misdeeds at the heart of the ongoing trial over Dewey & LeBoeuf LLP's collapse, partners and associates alike are starting to wonder if the principals at their firms could be up to no good. Here, Law360 identifies three warning signs that your firm's leadership could be on the same path as Dewey's.

US Law Firm Mergers Poised To Break Record

The U.S. law firm merger market stayed hot over the last three months and ahead of pace to break the all-time annual record, according to a tally by legal industry consultant Altman Weil Inc.

The Top In-House Hires Of September

Juniper Networks nabbed a tech industry vet, PGA of America found counsel with a golf background and Prudential geared up to say goodbye to a longtime GC. They top the list of last month's in-house hires you need to know about.

NJ Judge Hopefuls For Emergency Vacancies Make Headway

Two federal judicial nominees in New Jersey strongly endorsed by their U.S. senators, who urged a speedy confirmation to address four vacancies in the state declared judicial emergencies, moved closer to confirmation Wednesday, as did two candidates in Nebraska and Tennessee.

Calif. Judges Face Off Against State Over Judicial Pay

A certified class of thousands of California state judges and their beneficiaries argued at a bench trial on Wednesday that the state's chief fiscal officer illegally withheld raises and benefits mandated by a 1980 law that ties judicial pay to overall state employee salaries.

Enviros Score Major Win In Final EPA Effluent Rules

The U.S. Environmental Protection Agency's tough new rule for wastewater handling at steam power plants strays considerably from methods it endorsed in a proposed version, a move experts say is a clear win for environmentalists and another setback for America's fossil-fuel energy providers.

DC Circ. Won't Reconsider Clean Power Plan Ruling

The D.C. Circuit refused Tuesday to revisit its ruling allowing the U.S. Environmental Protection Agency's controversial proposed rule to slash greenhouse gas emissions at existing power plants to proceed, simultaneously denying the energy industry's and various states' requests to delay implementing the decision.

States, Industry Get BLM Fracking Rules Blocked

The U.S. Bureau of Land Management's new rules governing fracking on federal and tribal land took another hit Wednesday when a Wyoming federal judge granted a preliminary injunction that bars enforcement of the rules until the legal dispute plays out.

Pa. High Court Wants Pollution Eyed In Harley Tax Fight

The Supreme Court of Pennsylvania ruled Tuesday that environmental contamination must be considered when assessing a property's value and booted back to trial court a dispute over the assessment of a 230-acre piece of property owned by Harley-Davidson Motor Co. that was previously used for manufacturing weapons.

EPA Tightens Regs On Power Plant Wastewater Discharges

The U.S. Environmental Protection Agency on Wednesday finalized a rule that sets the first federal limits on the levels of toxic metals in wastewater that can be discharged from power plants, including mercury, lead and selenium.

Shell Reversal Puts Alaskan Arctic Drilling In Deep Freeze

Royal Dutch Shell PLC's decision to wave the white flag on its Arctic Ocean drilling plans is a sign that the region will remain undeveloped for the foreseeable future, especially as the plunge in oil prices makes companies skittish about investing in lengthy and expensive projects.

End May Be Nigh For 'Epic' Sacred Tribal Lands Drilling Row

A nearly three-decade battle with the government over Solenex's oil and gas drilling plans on federal lands sacred to the Blackfeet Nation could finally be forced to a resolution by a D.C. federal judge, but the company says a proposed government timetable could delay that resolution even further.

Nationwide VW Class Action Faces Long Road To Certification

The unlikely tag team of Quinn Emanuel Urquhart & Sullivan LLP and Hagens Berman Sobol Shapiro LLP have filed a 500-page proposed class action over Volkswagen's "defeat device" software designed to outwit emissions tests, but experts say differences in state law and individual consumers' reliance on the embattled automaker's advertising could impede nationwide class certification.

POLICY & REGULATION

Army Corps Disavows Staff Criticism Of Clean Water Rule

The U.S. Army Corps of Engineers testified before a Senate subcommittee Wednesday that earlier criticisms from its senior staff rebuking its collaborative process with the Environmental Protection Agency to draft the controversial Clean Water Rule are not indicative of the Corps' final support for the rule.

Pa. Gov. To Sign Bill Encouraging Mine Water Use For Fracking

Pennsylvania Gov. Tom Wolf supports a bill encouraging the use of treated mine water in natural gas drilling operations, which headed to his desk Wednesday after clearing both chambers of the General Assembly, his spokesman said.

ENFORCEMENT

EPA Reaches $55M Deal For Cleanup Of LA Superfund Site

The U.S. Environmental Protection Agency on Wednesday reached a $55 million settlement with Shell Oil Co. and the U.S. General Services Administration to clean up contaminated soil at the Del Amo Superfund site in Los Angeles, which is needed to prevent environmental damage from chemicals and address groundwater contamination.

Texas' Harris County lobbed a $100 million environmental suit against Volkswagen AG on Tuesday accusing it of using software to thwart emissions tests for its "clean diesel" vehicles, which the county attorney says is the first government lawsuit in connection with the emissions scandal.

LITIGATION

TransCanada To Drop Keystone XL Eminent Domain Suits

TransCanada Corp. on Wednesday said it will drop courtroom fights it was using to clear a path for its Keystone XL pipeline in favor of pursuing the issue at the Nebraska Public Service Commission, as many opponents of the pipeline and the law facilitating it have sought.

Fla. Appeals Court Again Rejects 'Novel' Takings Claim

A Florida appeals court on Wednesday affirmed its earlier ruling upon rehearing of a group of Miami-Dade County landowners' claims against the South Florida Water Management District, saying that it would not adopt a new standard for unconstitutional takings they presented.

EXPERT ANALYSIS

A New Model For Clean Energy: Community Solar Gardens

Community solar gardens offer substantial cost benefits over traditional residential solar panels. Members of solar gardens may qualify for certain federal and state tax benefits if the solar garden investment is correctly structured and the size of a solar garden renders it better able to achieve economies of scale, say attorneys at K&L Gates LLP.

Pope Francis And Pro Bono Publico

Listening to Pope Francis last week as he made his way from Washington to New York to Philadelphia, one could be forgiven for imagining he was a poverty lawyer in robes. Again and again, he shone light on challenges that pro bono lawyers have wrestled with for years, including the death penalty, housing and homelessness, immigration and even climate change, say Kevin Curnin and Jennifer Colyer of the Association of Pro Bono Counsel.

LEGAL INDUSTRY

Most Feared Plaintiffs Firm: Cohen Milstein

Since the financial crisis, Cohen Milstein Sellers & Toll PLLC has emerged as a leader in mortgage-backed securities litigation, returning nearly $2 billion to investors, as evidenced by a record-setting $500 million class action settlement with JPMorgan Chase over the sale of MBS.

How To Boost Your Chances Of A Raise In 2016

Raises are one of the most hotly anticipated moments of the year for many associates. Some can rest easy knowing a salary bump is more or less a given, but others face pressure to prove their value with their billable hours and to explain what they've done for their firms lately. Here, legal industry insiders offer advice to help associates position themselves for a raise in 2016.

Dewey Jury Eyes Conspiracy As Deliberations Progress

The jury in the trial of the former heads of Dewey & LeBoeuf LLP on Wednesday asked a New York judge to explain the elements of the conspiracy charge against the defendants, as deliberations stretched into the ninth full day.

3 Signs Your Firm Leaders Are Misbehaving

With a trio of former BigLaw executives' alleged misdeeds at the heart of the ongoing trial over Dewey & LeBoeuf LLP's collapse, partners and associates alike are starting to wonder if the principals at their firms could be up to no good. Here, Law360 identifies three warning signs that your firm's leadership could be on the same path as Dewey's.

US Law Firm Mergers Poised To Break Record

The U.S. law firm merger market stayed hot over the last three months and ahead of pace to break the all-time annual record, according to a tally by legal industry consultant Altman Weil Inc.

The Top In-House Hires Of September

Juniper Networks nabbed a tech industry vet, PGA of America found counsel with a golf background and Prudential geared up to say goodbye to a longtime GC. They top the list of last month's in-house hires you need to know about.

NJ Judge Hopefuls For Emergency Vacancies Make Headway

Two federal judicial nominees in New Jersey strongly endorsed by their U.S. senators, who urged a speedy confirmation to address four vacancies in the state declared judicial emergencies, moved closer to confirmation Wednesday, as did two candidates in Nebraska and Tennessee.

Calif. Judges Face Off Against State Over Judicial Pay

A certified class of thousands of California state judges and their beneficiaries argued at a bench trial on Wednesday that the state's chief fiscal officer illegally withheld raises and benefits mandated by a 1980 law that ties judicial pay to overall state employee salaries.

Crude export backers, foes press arguments ahead of Senate markup

By Kevin Rogers

Proponents and opponents of the crude oil export ban are using a new Congressional Budget Office report to boost their arguments ahead of a Senate Banking Committee vote on a bill that would end the 40-year-old policy.

The report, released this week, estimated that over the next 10 years, lifting the export ban would boost federal royalty payments by as much as $1.4 billion and could boost the price of

domestic crude oil by as much as $2.50 per barrel.

The American Petroleum Institute and other oil groups cheered the report's estimates that domestic production and supply would increase as a result of lifting the ban.

"American workers in every state — employed both within and outside the oil industry — stand to benefit as oil exports will stimulate economic activity across the country," API and 15 other oil, gas and drilling groups wrote to committee leaders. "American workers in every state — employed both within and outside the oil industry — stand to benefit as oil exports will stimulate economic activity across the country."

But Consumers and Refiners United for Domestic Energy, a group of refiners opposed to lifting the ban, pointed to the potential price increase for domestic crude as an indicator that U.S. gasoline prices would spike. The group also said the report didn't address many of the potential risks of ending the policy.

"Higher crude prices mean higher prices at the pump. The price of crude oil is the largest component in the price of gasoline," Executive Director Jay Hauck said in a statement.

"The CBO report doesn't take into account the negative effects of oil exports - increased economic penalty to consumers, lost refinery jobs, lost economic growth from higher fuel prices, and an increased trade deficit as we import more crude oil and petroleum products and reduce our exports of finished petroleum products," he continued.

The CBO analysis assessed a bill from Rep. Joe Barton, R-Texas, that is currently awaiting action in the House. The Senate version, set to be marked up Thursday, was introduced by Sens. Lisa Murkowski, R-Alaska, and Heidi Heitkamp, D-N.D.

The sole focus of both bills is lifting the ban, while maintaining some presidential flexibility to restrict exports during national emergencies. The Senate version would also order the Government Accountability Office to monitor the economic impact of exports.

However, White House Press Secretary Josh Earnest last month said the administration opposes the House bill. Spokesman Frank Benenati on Wednesday said it also opposes the Senate's effort.

"The Administration does not support efforts to move this bill," he said in an email. "At this time, legislation that removes crude export restrictions is not needed. Congress should be focusing on meeting America's clean energy needs and our transition to a low-carbon economy."

Committee Democrats are also wary of the measure. At a July hearing on the bill, ranking member Sen. Sherrod Brown, D-Ohio, voiced concerns on how the ending the ban would greenhouse gas emissions, refinery jobs and the frequency crude-by-rail shipments.

He said a relaxation of the ban, similar to current administration procedure for allowing

exports of condensate, might be a better path forward.

"This is often described as an all-or-nothing proposition, ending the ban or maintaining the status quo," Brown said. "I'd like to hear if there are alternatives."

Heitkamp, however, has indicated her bill could be part of a compromise alongside policies to benefit renewable energy, including extensions for wind and solar tax credits. Some members of the Democratic caucus have voiced support for that approach.

The American Action Forum, a conservative-leaning think tank, on Wednesday released its own report on lifting the ban. Based on an analysis of export data and price information, the group estimated the ban has cost the U.S. oil industry $1.2 trillion in gross profits annually assuming exports of 1.5 million barrels per day.

Food industry CEOs call for 'sound' deal on climate change

By The Associated Press

NEW YORK (AP) — The CEOs of several major food and beverage companies are calling on world leaders to push for a meaningful agreement at the United Nation's conference on climate change later this year in Paris.

The 10 companies, including cereal maker General Mills and candy maker Mars Inc., will run an open letter as a full-page ad in the Financial Times and Washington Post on Thursday. They say they will "re-energize" their own efforts to make their supply chains more sustainable as well.

"We are asking you to embrace the opportunity presented to you in Paris, and to come back with a sound agreement, properly financed, that can affect real change," the open letter reads.

The effort was organized by the environmental nonprofit Ceres, which is inviting other food and beverage companies to join in the commitment.

More

Feds reach nearly $2B legal settlement with fertilizer maker

By The Associated Press

GAINESVILLE, Fla. (AP) — One of the world's largest fertilizer makers is settling a massive hazardous waste lawsuit for nearly $2 billion to help clean up pollution and upgrade leaky facilities in Florida and Louisiana, according to the U.S. Department of Justice.

The department and the U.S. Environmental Protection Agency were set to announce the agreement with Minnesota-based The Mosaic Co. on Thursday. The deal still needs to be

finalized by the court.

The legal agreement concerns the proper storage and disposal of more than 60 billion tons of hazardous waste.

Mosaic makes a commonly used phosphorus-based fertilizer, the production of which creates tons of solid waste and polluted water.

More

Joaquin strengthening as it approaches Bahamas

By EnergyGuarian

MIAMI (AP) — Hurricane Joaquin is expected to strengthen in the Atlantic as it heads toward the central Bahamas, according to the National Hurricane Center in Miami.

The storm is expected to head toward the East Coast of the U.S. early next week, and Virginia Gov. Terry McAuliffe has already declared an emergency in the state as a result of flooding from continuing heavy rains even before the hurricane arrives.

The Hurricane Center said Joaquin was centered about 80 miles (125 km) east-southeast of San Salvador just before 2 a.m. Thursday. The Category 3 hurricane's maximum sustained winds had increased to 120 mph (195 kph). It was moving southwest at 6 mph (9 kph) and was expected to continue in that general direction for much of Thursday.

Additional strengthening is expected, with some fluctuations in intensity Thursday night and Friday.

More

Officials: California meeting water conservation target

By Scott Smith

FRESNO, Calif. (AP) — A state water official said Californians have met a mandate to save water for a third consecutive month during the grinding drought.

The State Water Resources Control Board on Thursday will release statewide conservation figures for August.

Max Gomberg, a senior climate scientist for the board, declined to provide specific figures ahead of the announcement but said he expects the results to meet the 25 percent savings

goal set by Gov. Jerry Brown.

However, Gomberg warned that Californians can't allow themselves to be distracted by the hype of a coming El Nino weather pattern that has raised hopes that it will break California's four-year drought.

More

VW plant cuts shift, financial arm freezes hiring

By The Associated Press

BERLIN (AP) — A Volkswagen engine factory said Wednesday it has dropped one shift a week and the company's financial services division imposed a temporary hiring freeze as the world's largest automaker grapples with an emissions-rigging scandal.

The extent of the fallout from the scandal, which erupted Sept. 18 when the U.S. Environmental Protection Agency said VW had cheated on tests of its diesel cars, remains unclear as do the costs to Volkswagen. Longtime CEO Martin Winterkorn quit last week, but said he was aware of no wrongdoing on his part.

In Germany, Stella Pechmann, a spokeswoman for the engine plant in the city of Salzgitter, confirmed a report Wednesday in the Wolfsburger Allgemeine Zeitung daily that a "special shift" is being cut as a precaution because of the current situation. The shift had previously been added to deal with high demand.

Separately, the Volkswagen Financial Services division is freezing new hiring until the end of the year, though spokesman Stefan Voges told news agency dpa that existing hiring agreements are unaffected.

Ruling backs Shell's use of Seattle homeport for its fleet

By The Associated Press

Sponsored Links

SEATTLE (AP) — A hearing examiner says Seattle officials erred when they said the Port of Seattle couldn't host Shell Oil's Arctic drilling fleet under its current permit.

Mayor Ed Murray said in May that the port needed a new land use permit to host Shell's drilling fleet. City planners had decided the proposed activities weren't allowed under the existing permit.

After an appeal, the hearing officer ruled Wednesday that the city's interpretation is "clearly erroneous" and the activities are proper uses for a cargo terminal.

Murray says he's disappointed but will respect the ruling.

More

Shell Nigeria stops Forcados pipeline exports after leak

By The Associated Press

WARRI, Nigeria (AP) — Shell Nigeria says yet another leak on the Trans Forcados Pipeline is forcing it to stop exports from the terminal that carries one fifth of Nigeria's exports.

It gave no reason for the leak on the aging pipeline which suffers regular sabotage by oil thieves and environmental activists.

Shell declared force majeure Wednesday afternoon, giving it some legal protection against contractual obligations.

Nigeria is Africa's biggest oil producer and the Forcados terminal has capacity to export 400,000 barrels a day.

Sorry to send this to you so late, but as we all know we've been busy with other things. I mentioned to you a couple of weeks ago that we had some comments/questions on the GHG off-cycle credit request you submitted, so I'm sending them to you now. As you can see from the email message trail, these questions come from Chris Lieske of ASD. Chris has the lead in reviewing the data for EPA, so feel free to send your responses to both of us.

Let me know if you have any other questions.

Thanks,

Linc

Subject: FW: GHG Off-Cycle Credit Request for 2013 MY

Chris,

Attached are VW's request for GHG off-cycle credits for 2012-2013 MYs. Their request are for the same credits allowed in the table for 2014 MY similar to the Mercedes, Ford, and Chrysler requests that we approved. I was hoping that you would be able give them a quick scan and let us know if you have any questions or concerns about their request. Please let me know if you will be able to help.

Thanks,

Linc

Linc -

I found the following which may or may not be issues.

- I couldn't figure out the calculations for lighting for the 2012 Tiguan, 2012-2013 Tourag, 2013 Beetle, and 2012-2013 EOS in Section 3. These may not be correct.

- The high beam credits are missing from the 2012 Audi lighting so the credits don't add up in Section 3.

- No Cd delta is provided that I could find for ride height so the calculation can't be reproduced.

- Two Cd delta's are provided for the spoiler, 0.008 and 0.020. With 0.008, the 0.2 g/mile credit they are claiming can be calculated. They seem to be also claiming a 0.2 g/mile credit for the spoiler with the 0.020 Cd delta even though it seems like the credit would be greater in this case

Subject: RE: Hi from EPA

Thanks.

The editors would like to see this up by early tomorrow.

With regard to the second question, I've got it confirmed now that the EPA did use "real world" testing (then known as ROVER) on light duty and heavy duty vehicles in the 90s. It was done out of a lab in Alexandria, and the results were used to get three consent decrees in those years. Then the EPA closed the lab about 2001. The heavy duty testing may have continued elsewhere, but the real world testing of cars did not. (Byron said the real world testing of trucks began about a decade ago, but has not been done on cars.)

Some of the engineers who worked at the Alexandria lab say that had the lab remained open, and had they tested the VW diesel with ROVER, they would have detected the discrepancy immediately.

All of rhat prompts two questions. Why was the real world testing of cars by EPA discontinued? How much will real world testing of cars be done in the future?

Thanks again.

Peter

Hi Peter,

On the first question, the program suggested you check directly with SAE.

Working on the second.

Do you have a better sense of when you might wrap reporting and publish?

Thanks

Julia

> Hi Julia –
>
> I am writing to follow up from yesterday's background interview, which was very helpful.
>
> The two questions that required follow up were:

1) How can I get a copy of the SAE paper the Byron mentioned? I think he said it goes into the history of the EPA PEMS efforts.

2) Then the history question. As I understand it, there was some PEMS-like testing, then known as ROVER – for Real-time On-road Vehicle Emissions Reporter – that was used on light duty vehicles out of an EPA/contractor lab based in Alexandria during the '90s, and that work led to consent decrees against manufacturers in 1995, 1997 and 1998. The Alexandria lab was closed in 2001, and since then any PEMS or PEMS-like emissions testing by EPA for validation has focused on heavy-duty engines. Is that correct?

Thanks again for arranging all this.

Best,

Peter

Subject: Morning Consult Energy: Congress Averts Government Shutdown; VW Might Not Face Criminal Charges

By Colleen Leahy

Today's Washington Brief

- Congress passed a stopgap spending bill that averts a government shutdown by providing funding through Dec. 11. The House passed the measure 257-151, with Democrats providing most of the support. (The New York Times)

- The House Energy and Commerce Committee approved broad energy legislation with considerably less support than it's had in the past, with only three Democrats supporting the bill in the 32-20 vote tally. The House is expected to vote on the measure in the coming weeks, but critics say bipartisan concessions have rendered the bill ineffective. (Morning Consult)

- Sen. Pat Toomey (R-Pa.) is aiming to abolish the federal mandate to blend renewable ethanol-based fuels with gasoline, and he plans on offering such an amendment, which is supported by Sen. Dianne Feinstein (D-Calif.), at a Senate Banking Committee markup of the oil export bill. (Houston Chronicle)

Today's Business Brief

- Volkswagen might not face criminal charges over its environmental violations due to a loophole for automobiles in the 1970 Clean Air Act. If the company does end up facing criminal charges, it would be the first-ever case against an automaker over emissions standards. (The Wall Street Journal)

- TransCanada said it is withdrawing from legal disputes over use of private land in Nebraska for the Keystone XL pipeline. The company will instead submit to reviews by the state's Public Service Commission, which must approve the project in order for it to move forward. (Bloomberg News)

- A group of investors led by Dallas-based Hunts Consolidated Inc. filed for regulatory approval for their bid to purchase Texas' largest utility, Oncor, from its bankrupt parent company Energy Future Holdings in a deal that would value the company between $18 billion and $19 billion. (Dallas Business Journal)

General

Spending Bill Passes, Averting a Shutdown
David M. Herszenhorn, The New York Times

With only hours to spare on the last day of the fiscal year, Congress averted a government shutdown on Wednesday by approving a temporary spending measure to keep federal agencies operating through Dec. 11. In the House, the legislation was approved only because of strong support by Democrats — a sign of how angry rank-and-file Republicans remain over their powerlessness to force policy changes on the Obama administration.

House Panel OKs Sweeping Energy Bill, But Cracks Are Showing
Deirdra O'Regan, Morning Consult

A divided House Energy and Commerce Committee approved a wide-ranging energy bill Wednesday, clearing the way for it to potentially reach the floor within weeks. The measure had broad bipartisan support throughout much of the drafting process. But since then fissures have appeared, as evidenced by a lengthy markup that included 41 amendments and a final 32-20 vote, with only three Democrats backing the legislation.

Bush's Energy Plan Promises Impractical Rollbacks
Deirdra O'Regan, Morning Consult

A major part of Bush's energy plan focuses on unraveling the Obama administration's landmark energy initiatives that are intended to rely less on coal and oil. But rollbacks like these aren't so easy.

Volkswagen May Not Face Environmental Criminal Charges
Amy Harder and Aruna Viswanatha, The Wall Street Journal

Despite the scale of Volkswagen's behavior—it has admitted using test-evading software in as many as 11 million carsworld-wide—the German auto maker may not face an environmental crime charge here, legal experts say. If the Justice Department does pursue a criminal case, it would be the first-ever against an auto maker for skirting emissions standards.

EPA drops water pollution rules
Tim Devaney, The Hill

The Environmental Protection Agency (EPA) is moving forward with new rules to reduce water pollution around the country. Power plants will face restrictions on discharging toxic pollutants such as mercury, arsenic, lead, and selenium into the water. These chemicals are known to cause cancer and learning disabilities, the agency noted.

Manufacturers, mayors spar on ozone rule
Devin Henry, The Hill

More than 50 mayors signed a letter last week calling on President Obama to tighten the ozone standard from its current 75 parts per billion limit, something federal regulators are required to do by Thursday. In their letter, the mayors endorsed pleas from health organizations such as the American Lung Association, which has called for a 60 parts per billion limit, lower than the range regulators are considering for the final rule.

Congress Fails To Reauthorize Land & Water Conservation Fund
Edward O'Brien, Montana Public Radio

The Land and Water Conservation Fund wasn't included in a stopgap funding bill that staved off a government shutdown. It's the first time in its 50-year history it hasn't been reauthorized.

What's next after Keystone? Fighting fossil fuel extraction on public lands
Ben Adler, Grist

Now that Hillary Clinton has announced her opposition to Keystone, the pipeline proposal that seemed like it would never go away now looks like it finally will. What will succeed the fight over Keystone as the next major grassroots anti–climate change effort? Calling for a presidential ban on extracting fossil fuels offshore and on federal land.

Industry leader pitches shifting energy to Resources panel
Phil Taylor, E&E

The House Energy and Commerce Committee has too many issues under its jurisdiction and should have its energy powers transferred to the Natural Resources Committee, according to American Energy Alliance President Thomas Pyle. Pyle, a former lobbyist for Koch Industries, said E&C is "no longer functional" due to the breadth of its jurisdiction, which includes energy, telecommunications, technology and health care.

Behaviorists Show the U.S. How to Improve Government Operations
Binyamin Appelbaum, The New York Times

Governments generally operate on the assumption that people are rational. Yet a growing body of research has found that people are not only irrational on occasion, but they tend to be irrational in some consistent and predictable ways. And researchers from this new school argue the government should account for these tendencies.

U.S. Index Futures Rise as China Data Fuel Optimism Worst Over
Roxana Zega, Bloomberg News

Standard & Poor's 500 Index E-mini contracts expiring in December rose 0.4 percent to 1,917 at 7:27 a.m. in New York, paring earlier gains of as much as 1.1 percent. The S&P 500 posted its best rally in three weeks yesterday as investors snapped up some of the third quarter's most-battered companies, with energy, raw-material and health-care shares among the leaders, while a gauge of volatility had its steepest decline in more than a week.

Oil & Natural Gas

Oil rises above $49 on heightened Syria risks
Alex Lawler, Reuters

Oil rose above $49 a barrel on Thursday as an emerging risk premium over the situation in Syria countered further signs of an economic slowdown in Asia and rising U.S. inventories.

TransCanada Cries Uncle in Nebraska in Bid to Speed Keystone XL
Andrew M. Harris and Rebecca Penty, Bloomberg News

TransCanada Corp. is surrendering to an additional review of the Keystone XL oil pipeline and backing off from conflicts with Nebraska landowners as it struggles to win approval for the project. Instead of waging court battles to cross privately owned land and trying to avoid a review by Nebraska's Public Service Commission, TransCanada will withdraw lawsuits and seek approval from the regulator, the Calgary-based company said Tuesday.

Sen. Pat Toomey seeks to shred biofuel mandates as part of oil exports bill
Jennifer A. Dlouhy, Houston Chronicle

If the Senate is going to lift the nation's longstanding ban on oil exports, Sen. Pat Toomey wants to make sure a federal biofuels mandate vanishes at the same time. The Republican from Pennsylvania is advancing a plan — cosponsored by Sen. Dianne Feinstein, D-Calif. — that would lift the requirement to blend traditional ethanol-based renewable fuels into U.S. gasoline.

White House does not support Senate efforts to lift oil export ban
Timothy Gardner and Roberta Rampton, Reuters

The White House does not support Senate legislation to lift the 40-year-old ban on oil exports despite a provision allowing the president to halt exports if he deemed them not in the interests of national security, a spokesman said on Wednesday.

Oil Drillers Spared More Misery by U.S. Judge's Fracking Ruling
Andrew M. Harris and Mark Drajem, Bloomberg News

A U.S. judge in Wyoming has blocked new rules that tighten controls over fracking on federal lands, granting a measure of relief to producers who would have faced higher costs at a time when profits already are strangled by low crude prices. The order by U.S. District Judge Scott Skavdahl puts a temporary hold on the most closely-watched effort by the Obama administration to ensure that hydraulic fracturing doesn't contaminate water supplies.

2 years after spill, still no pipeline inspectors stationed in N.D.
Mike Nowatzki, The Billings Gazette

Two years after experiencing the biggest oil spill in state history, North Dakota still has no state or federal inspectors stationed within its borders to oversee hazardous liquids pipelines – but it's not for lack of trying. During a meeting Tuesday with the state's Public Service Commission, officials with the federal Pipeline and Hazardous Materials Safety Administration said they advertised jobs within the past year for pipeline inspectors who could work remotely from Bismarck and Fargo.

Shale Boom Bypasses New England
Cassandra Sweet, The Wall Street Journal

Natural gas is so abundant and cheap in much of the U.S. that producers want to export it overseas. Except in New England, where gas is so hard to get that companies are importing it from as far away as Yemen.

Natural gas industry looks to carve out bigger role in Ill., Midwest
Jeffrey Tomich, E&E

In a state where nuclear power and coal dominate politics and electricity markets, can natural gas find a place at the table? While natural gas powered just a tiny fraction of the electricity generated in Illinois last year, Washington-based America's Natural Gas Alliance is making the case for it to play a much larger role in the state and elsewhere in the Midwest as regulators look to slash carbon dioxide emissions under the Obama administration's Clean Power Plan.

Utilities & Infrastructure

Hunts officially file $18B plan to buy Oncor power utility from EFH
Bill Hethcock, Dallas Business Journal

A group of investors led by Hunt Consolidated Inc. on Tuesday filed an application to the Public Utility Commission of Texas seeking regulatory approval to buy Energy Future Holdings' ownership stake in Texas' largest power utility, Oncor. In the PUC application, the Hunt group spells out its plans to buy the utility from bankrupt parent company EFH in a deal that values Oncor at between $18 and $19 billion.

EPA Finalizes Steam Electric Power Plant Effluent Guidelines
Sonal Patel, Power Magazine

The Environmental Protection Agency (EPA) has finalized revisions to technology-based effluent limitations guidelines and standards, setting the first federal limits on the levels of toxic metals in wastewater discharges from steam electric power plants. The new rule sets stringent new requirements for the discharge of arsenic, mercury, selenium, and nitrogen in wastewater streams from flue gas desulfurization, and it requires zero-discharge of pollutants in ash transport water.

Renewables

Gov. Baker testifies in favor of renewable energy bills
The Associated Press

Boston Gov. Charlie Baker told a packed Statehouse hearing Tuesday that he's open to

exploring long-term contracts with utilities for off-shore wind and hydropower as ways to both lower energy costs and lower the state's carbon footprint. The state currently doesn't have the authority to allow utilities to pursue long-term contacts — up to 15 or 25 years — with large scale renewable energy producers like wind, solar or hydropower, said Baker, who testified on two of his energy bills.

Kasich calls indefinite freeze of Ohio clean-energy standards 'unacceptable'
Dan Gearino, The Columbus Dispatch

The hits began early and kept on coming Wednesday for a new plan from Republican state legislators to place an indefinite freeze on Ohio's clean-energy standards, with the governor and many others saying the proposal is a bad idea. Much of the criticism was expected, coming from environmentalists, Democrats and other known opponents.

Coal

Ex-Coal CEO Heads to Trial for Alleged Worker-Safety Breaches
Kris Maher, The Wall Street Journal

Former Massey Energy CEO Don Blankenship is set to go on trial Thursday on criminal charges that he conspired to violate federal workplace-safety laws ahead of the worst U.S. coal-mining disaster in four decades. Mr. Blankenship, 65 years old, is the first CEO of a major U.S. corporation to be charged criminally for conspiring to violate workplace-safety rules following a deadly industrial accident, say safety experts.

Nuclear

Ex-governor of Idaho sues feds seeking info on nuke proposal
Keith Ridler, The Associated Press

A former Idaho governor has filed a federal lawsuit seeking to force the U.S. Department of Energy to release information about proposed shipments of spent commercial nuclear fuel to an Idaho facility. The lawsuit filed Tuesday in U.S. District Court in Boise contends the federal agency is failing to comply with Freedom of Information Act requirements.

Climate

Toxic Algae Outbreak Overwhelms a Polluted Ohio River
Michael Wines, The New York Times

The Ohio River, transformed by mining and industrial waste and sewage overflows into the nation's most polluted major waterway, has a new and unexpected tormentor this

fall: carpets of poisonous algae. Pads of toxic blue-green algae have speckled nearly two-thirds of the 981-mile river in the last five weeks, experts say, in an outbreak that has curbed boating, put water utilities on alert and driven the river's few hardy swimmers back to shore.

Opinions, Editorials & Perspectives

Smog Kills
David Baron, Politico

We've long known that current smog standards are woefully inadequate. Four times in the last eight years, the EPA's independent science advisors have unanimously called for stronger standards. But thanks to politics, we've remained stuck with standards that allow the air to be so dirty it leaves people literally gasping for breath.

New Obama EPA Air Standards Put 4 Million Jobs At Risk
Stephen Moore, Investor's Business Daily

The old saying that liberals love jobs but hate employers is borne out as President Obama implements new air standards. Industry will bear the brunt, but consumers and blue-collar workers will feel a pinch, too. A study sponsored by NERA Economic Consulting, a nonpartisan research group, found that about 4 million jobs would be jeopardized by the new rules over the next 25 years — equal to putting every worker in Ohio out of work.

Shell's abandoned well and the myth of the Arctic oil land grab
Scott L. Montgomery, The Conversation

To those of us in who closely follow the energy industry, Shell's decision is hardly surprising. But it has meaning well beyond the Chukchi Sea. It helps show that the widely proclaimed "land rush" to the Arctic, aimed at oil and gas most of all, is a myth.

Research Reports, Issue Briefs & Case Studies

Shale gas development in China aided by government investment and decreasing well cost
U.S. Energy Information Administration

Decreases in the cost to drill shale gas wells and continued investment into domestic production have allowed China to increase its development of shale gas. Although reliance on natural gas imports has increased in the Chinese energy market, future shale gas production in China would help to meet natural gas demand as the country faces difficulties in developing other natural gas resources, including coalbed methane.

Subject: Morning Consult Energy: Congress Averts Government Shutdown; VW Might Not Face Criminal Charges

By Colleen Leahy

Today's Washington Brief

- Congress passed a stopgap spending bill that averts a government shutdown by providing funding through Dec. 11. The House passed the measure 257-151, with Democrats providing most of the support. (The New York Times)

- The House Energy and Commerce Committee approved broad energy legislation with considerably less support than it's had in the past, with only three Democrats supporting the bill in the 32-20 vote tally. The House is expected to vote on the measure in the coming weeks, but critics say bipartisan concessions have rendered the bill ineffective. (Morning Consult)

- Sen. Pat Toomey (R-Pa.) is aiming to abolish the federal mandate to blend renewable ethanol-based fuels with gasoline, and he plans on offering such an amendment, which is supported by Sen. Dianne Feinstein (D-Calif.), at a Senate Banking Committee markup of the oil export bill. (Houston Chronicle)

Today's Business Brief

- Volkswagen might not face criminal charges over its environmental violations due to a loophole for automobiles in the 1970 Clean Air Act. If the company does end up facing criminal charges, it would be the first-ever case against an automaker over emissions standards. (The Wall Street Journal)

- TransCanada said it is withdrawing from legal disputes over use of private land in Nebraska for the Keystone XL pipeline. The company will instead submit to reviews by the state's Public Service Commission, which must approve the project in order for it to move forward. (Bloomberg News)

- A group of investors led by Dallas-based Hunts Consolidated Inc. filed for regulatory approval for their bid to purchase Texas' largest utility, Oncor, from its bankrupt parent company Energy Future Holdings in a deal that would value the company between $18 billion and $19 billion. (Dallas Business Journal)

General

Spending Bill Passes, Averting a Shutdown
David M. Herszenhorn, The New York Times

With only hours to spare on the last day of the fiscal year, Congress averted a government shutdown on Wednesday by approving a temporary spending measure to keep federal agencies operating through Dec. 11. In the House, the legislation was approved only because of strong support by Democrats — a sign of how angry rank-and-file Republicans remain over their powerlessness to force policy changes on the Obama administration.

House Panel OKs Sweeping Energy Bill, But Cracks Are Showing
Deirdra O'Regan, Morning Consult

A divided House Energy and Commerce Committee approved a wide-ranging energy bill Wednesday, clearing the way for it to potentially reach the floor within weeks. The measure had broad bipartisan support throughout much of the drafting process. But since then fissures have appeared, as evidenced by a lengthy markup that included 41 amendments and a final 32-20 vote, with only three Democrats backing the legislation.

Bush's Energy Plan Promises Impractical Rollbacks
Deirdra O'Regan, Morning Consult

A major part of Bush's energy plan focuses on unraveling the Obama administration's landmark energy initiatives that are intended to rely less on coal and oil. But rollbacks like these aren't so easy.

Volkswagen May Not Face Environmental Criminal Charges
Amy Harder and Aruna Viswanatha, The Wall Street Journal

Despite the scale of Volkswagen's behavior—it has admitted using test-evading software in as many as 11 million carsworld-wide—the German auto maker may not face an environmental crime charge here, legal experts say. If the Justice Department does pursue a criminal case, it would be the first-ever against an auto maker for skirting emissions standards.

EPA drops water pollution rules
Tim Devaney, The Hill

The Environmental Protection Agency (EPA) is moving forward with new rules to reduce water pollution around the country. Power plants will face restrictions on discharging toxic pollutants such as mercury, arsenic, lead, and selenium into the water. These chemicals are known to cause cancer and learning disabilities, the agency noted.

Manufacturers, mayors spar on ozone rule
Devin Henry, The Hill

More than 50 mayors signed a letter last week calling on President Obama to tighten the ozone standard from its current 75 parts per billion limit, something federal regulators are required to do by Thursday. In their letter, the mayors endorsed pleas from health organizations such as the American Lung Association, which has called for a 60 parts per billion limit, lower than the range regulators are considering for the final rule.

Congress Fails To Reauthorize Land & Water Conservation Fund
Edward O'Brien, Montana Public Radio

The Land and Water Conservation Fund wasn't included in a stopgap funding bill that staved off a government shutdown. It's the first time in its 50-year history it hasn't been reauthorized.

What's next after Keystone? Fighting fossil fuel extraction on public lands
Ben Adler, Grist

Now that Hillary Clinton has announced her opposition to Keystone, the pipeline proposal that seemed like it would never go away now looks like it finally will. What will succeed the fight over Keystone as the next major grassroots anti–climate change effort? Calling for a presidential ban on extracting fossil fuels offshore and on federal land.

Industry leader pitches shifting energy to Resources panel
Phil Taylor, E&E

The House Energy and Commerce Committee has too many issues under its jurisdiction and should have its energy powers transferred to the Natural Resources Committee, according to American Energy Alliance President Thomas Pyle. Pyle, a former lobbyist for Koch Industries, said E&C is "no longer functional" due to the breadth of its jurisdiction, which includes energy, telecommunications, technology and health care.

Behaviorists Show the U.S. How to Improve Government Operations
Binyamin Appelbaum, The New York Times

Governments generally operate on the assumption that people are rational. Yet a growing body of research has found that people are not only irrational on occasion, but they tend to be irrational in some consistent and predictable ways. And researchers from this new school argue the government should account for these tendencies.

U.S. Index Futures Rise as China Data Fuel Optimism Worst Over
Roxana Zega, Bloomberg News

Standard & Poor's 500 Index E-mini contracts expiring in December rose 0.4 percent to 1,917 at 7:27 a.m. in New York, paring earlier gains of as much as 1.1 percent. The S&P 500 posted its best rally in three weeks yesterday as investors snapped up some of the third quarter's most-battered companies, with energy, raw-material and health-care shares among the leaders, while a gauge of volatility had its steepest decline in more than a week.

Oil & Natural Gas

Oil rises above $49 on heightened Syria risks
Alex Lawler, Reuters

Oil rose above $49 a barrel on Thursday as an emerging risk premium over the situation in Syria countered further signs of an economic slowdown in Asia and rising U.S. inventories.

TransCanada Cries Uncle in Nebraska in Bid to Speed Keystone XL
Andrew M. Harris and Rebecca Penty, Bloomberg News

TransCanada Corp. is surrendering to an additional review of the Keystone XL oil pipeline and backing off from conflicts with Nebraska landowners as it struggles to win approval for the project. Instead of waging court battles to cross privately owned land and trying to avoid a review by Nebraska's Public Service Commission, TransCanada will withdraw lawsuits and seek approval from the regulator, the Calgary-based company said Tuesday.

Sen. Pat Toomey seeks to shred biofuel mandates as part of oil exports bill
Jennifer A. Dlouhy, Houston Chronicle

If the Senate is going to lift the nation's longstanding ban on oil exports, Sen. Pat Toomey wants to make sure a federal biofuels mandate vanishes at the same time. The Republican from Pennsylvania is advancing a plan — cosponsored by Sen. Dianne Feinstein, D-Calif. — that would lift the requirement to blend traditional ethanol-based renewable fuels into U.S. gasoline.

White House does not support Senate efforts to lift oil export ban
Timothy Gardner and Roberta Rampton, Reuters

The White House does not support Senate legislation to lift the 40-year-old ban on oil exports despite a provision allowing the president to halt exports if he deemed them not in the interests of national security, a spokesman said on Wednesday.

Oil Drillers Spared More Misery by U.S. Judge's Fracking Ruling
Andrew M. Harris and Mark Drajem, Bloomberg News

A U.S. judge in Wyoming has blocked new rules that tighten controls over fracking on federal lands, granting a measure of relief to producers who would have faced higher costs at a time when profits already are strangled by low crude prices. The order by U.S. District Judge Scott Skavdahl puts a temporary hold on the most closely-watched effort by the Obama administration to ensure that hydraulic fracturing doesn't contaminate water supplies.

2 years after spill, still no pipeline inspectors stationed in N.D.
Mike Nowatzki, The Billings Gazette

Two years after experiencing the biggest oil spill in state history, North Dakota still has no state or federal inspectors stationed within its borders to oversee hazardous liquids pipelines – but it's not for lack of trying. During a meeting Tuesday with the state's Public Service Commission, officials with the federal Pipeline and Hazardous Materials Safety Administration said they advertised jobs within the past year for pipeline inspectors who could work remotely from Bismarck and Fargo.

Shale Boom Bypasses New England
Cassandra Sweet, The Wall Street Journal

Natural gas is so abundant and cheap in much of the U.S. that producers want to export it overseas. Except in New England, where gas is so hard to get that companies are importing it from as far away as Yemen.

Natural gas industry looks to carve out bigger role in Ill., Midwest
Jeffrey Tomich, E&E

In a state where nuclear power and coal dominate politics and electricity markets, can natural gas find a place at the table? While natural gas powered just a tiny fraction of the electricity generated in Illinois last year, Washington-based America's Natural Gas Alliance is making the case for it to play a much larger role in the state and elsewhere in the Midwest as regulators look to slash carbon dioxide emissions under the Obama administration's Clean Power Plan.

Utilities & Infrastructure

Hunts officially file $18B plan to buy Oncor power utility from EFH
Bill Hethcock, Dallas Business Journal

A group of investors led by Hunt Consolidated Inc. on Tuesday filed an application to the Public Utility Commission of Texas seeking regulatory approval to buy Energy Future Holdings' ownership stake in Texas' largest power utility, Oncor. In the PUC application, the Hunt group spells out its plans to buy the utility from bankrupt parent company EFH in a deal that values Oncor at between $18 and $19 billion.

EPA Finalizes Steam Electric Power Plant Effluent Guidelines
Sonal Patel, Power Magazine

The Environmental Protection Agency (EPA) has finalized revisions to technology-based effluent limitations guidelines and standards, setting the first federal limits on the levels of toxic metals in wastewater discharges from steam electric power plants. The new rule sets stringent new requirements for the discharge of arsenic, mercury, selenium, and nitrogen in wastewater streams from flue gas desulfurization, and it requires zero-discharge of pollutants in ash transport water.

Renewables

Gov. Baker testifies in favor of renewable energy bills
The Associated Press

Boston Gov. Charlie Baker told a packed Statehouse hearing Tuesday that he's open to

exploring long-term contracts with utilities for off-shore wind and hydropower as ways to both lower energy costs and lower the state's carbon footprint. The state currently doesn't have the authority to allow utilities to pursue long-term contacts — up to 15 or 25 years — with large scale renewable energy producers like wind, solar or hydropower, said Baker, who testified on two of his energy bills.

Voluntary Emissions Recall Report (VERR)
Help Section

General

Validate Form Button

Clicking this button will check to see if the form is valid and identify any form errors for correction. Failure to submit a valid form means you have not met reporting requirements and the system will reject the form.

Report Information

New VERR or Correct / Update VERR

If you are submitting this VERR for the first time, you should select "New VERR." If you are updating or correcting a previously submitted VERR, you should select "Correct / Update VERR." If you select "Correct / Update VERR", you must enter the number of the original VERR that you are updating / correcting and the reason that you are correcting or updating the VERR.

EPA VERR Number

You must enter a number for the VERR. If you are submitting a new VERR, the number should be exactly four digits and must contain zeroes for numbers with fewer than four significant digits (e.g., "0007").

Manufacturer VERR Number

You may enter anything, up to 20 characters into this field, it is designed to allow manufacturers to internally track their defect reports. If you are using your own internal number for VERR tracking purposes, you may enter it here. Otherwise, enter the EPA VERR number here.

Form version number

You must enter a two digit form version number. If you are submitting a corrected or updated VERR, increment the number of the previous submitted VERR. The number should be exactly 2 digits and must contain zeroes for numbers with fewer than two significant digits (e.g., "01").

Reason for correction / update

If you selected "Correct / Update VERR", you must enter the reason that you are correcting or updating the VERR. If you are submitting the VERR for the first time, you should select "New VERR." (4000 Character Limit)

Additional email address

You may enter an additional group e-mail that can be used in notifications or communications concerning this report. The primary e-mail used for notifications or communications will be the one provided during the Verify registration process.

Owner notification start date

Enter the first date that you notified owners about the voluntary emissions recall campaign described in this report.

Owner notification final date

Enter the final date that you notified owners about the voluntary emissions recall campaign described in this report.

Voluntary Emissions Recall Report (VERR)
Help Section

Problem category

This list is used to categorize the problem identified in the EDIR. You must only select one category and it should be for the primary problem, if there are multiple problems identified in the EDIR. For example, if an EGR valve problem is defective and, subsequently, an On-board Diagnostic (OBD) malfunction indicator lamp (MIL) is illuminated for an EGR fault, the problem category should identify the EGR components as defective, not the OBD system. In contrast, if an OBD MIL is being erroneously illuminated for EGR valves that are not defective and the OBD programming is being corrected, then the problem category should identify the OBD system as defective.

Defect description

Clearly identify the device, system, assembly or software that has the defect, what the defect is, and to the extent known at the time, the cause of the defect. (4000 Character Limit)

Related Emissions Defect Information Report

Enter the number(s) for the related EDIR(s) for this VERR. If you are entering multiple EDIR numbers use the "Add EDIR #" button. You may add up to twelve related EDIR Numbers.

Describe the specific modifications.

Include alterations, repairs, corrections, adjustments and other changes that will be performed to address the emission-related defect. (4000 Character Limit)

Describe the method used to determine the names and addresses of the vehicle or engine owners

Describes the method used to determine the names and addresses of the vehicle or engine owners. (4000 Character Limit)

Describe the proper maintenance or use upon which the manufacturer determines eligibility for repair

Describes the requirements (e.g., mileage) to meet in order to be eligible for manufacturer repair. (4000 Character Limit)

Describe the procedure for the vehicle or engine owners to correct the nonconformity

Describes the procedure that the vehicle or engine owner should follow in order to correct the defect. (4000 Character Limit)

Describe any authorized warranty agents or persons other than dealers who will remedy the defect

Describes any authorized warranty agents or persons other than dealers who will remedy the defect. (4000 Character Limit)

Describe the system used to assure an adequate supply of parts will be available to perform the repair

Describes the system used to assure an adequate supply of parts for performing the repair. (4000 Character Limit)

Describe the impact of the proposed changes on fuel economy

Describes the impact of the proposed changes the on fuel economy of the vehicles or engines. (4000 Character Limit)

Describe the impact of the proposed changes on drivability

Describes the impact of the proposed changes on the drivability of the vehicles or engines. (4000 Character Limit)

Voluntary Emissions Recall Report (VERR)
Help Section

Describe the impact of the proposed changes on safety

Describes the impact of the proposed changes on the safety of the vehicles or engines. (4000 Character Limit)

Type of related documents to be submitted to the Verify Document Module

If you are submitting documents related or supporting the VERR to the Verify Document Module, you can use this list to identify one or more of these documents that you are submitting. If you are submitting documents containing confidential business information (CBI) you should select "Other (Specify in 'Notes' field" and indicate in the "Notes" field that a CBI document is being submitted separately (e.g., "CBI attached in separate document.")".

Number of related documents to be submitted to Verify Document Module

Enter the number of documents you will be submitting to the Verify Document Module. Since some documents may be combined, it is helpful to know how many related documents that accompany an EDIR should be retrieved from the Verify Document Module.

Notes

Use this field to enter any notes and/or comments. In addition, there are particular fields that require you to enter notes when certain options are selected and this field should be used for this that purpose. (4000 Character Limit)

Affected Vehicles / Engines Description

Test Group / Engine Family

Enter the test group or engine family of the affected vehicle(s) or engine(s). [Example: 9EPAX04.23A1]

Certified Sales Area

Select the appropriate certified sales area for the applicable test group or engine family. For vehicles that were certified to exhaust emission standards for California and Section 177 states, select the "CA+177 States" option. For vehicles that were certified to exhaust emission standards for states outside other than California and Section 177 states, select the "FED" option. For vehicles that were certified to exhaust emission standards for California and Section 177 states and states other than California and Section 177 states, select the "50-State" option.

Number Covered by Recall

Enter the number of vehicles from each test group that will be remedied by the actions described in the VERR. The number of vehicles recalled for each test group will be totaled and displayed in the "Total Covered by the Recall" box at the top right of the form for comparison purposes. Please enter the accurate number of vehicles for each test group to ensure that the total number covered by the recall is accurate.

Make

Enter the specific make (i.e., name plate) for the affected vehicle(s) or engine(s). [Example: Buick, Lexus, Mercury]

Model / Calibration

Enter the model or calibration name that the manufacturer has designated for the vehicle or the calibration for the engine that is affected in the defect recall report

Help Section

Model Year

Enter the model year of the affected vehicle(s) or engine(s). [Example: 2001]

Displacement (liters)

Enter the engine displacement for the affected vehicle(s) or engine(s) in liters. [Example: 4.23]

Vehicle Information Page Buttons

Add Test Group / Engine Family - This button is used if a report covers multiple Test Groups / Engine Families. Clicking this button creates additional Test Group / Engine Family tables at the end of the "Affected Vehicles / Engines Description" section. Each additional Test Group / Engine Family table will have a row to add Vehicle / Engine Information. Additional rows can be added if this Test Group / Engine Family covers multiple Vehicles / Engines (see instructions below for adding rows to the Vehicle / Engine Information section).

Delete Test Group / Engine Family - This button is used for deleting a Test Group / Engine Family Table. Clicking this button in a Test Group / Engine Family table will delete that Test Group / Engine Family table, and all associated Vehicle/Engine Information, only.

Add Vehicle / Engine - This button is used if a Test Group / Engine Family covers multiple Vehicles / Engines. Clicking this button in a Test Group / Engine Family table will add a new row to the bottom of the Vehicle / Engine Information section in that Test Group / Engine Family table only.

Delete Vehicle / Engine - This button is used for deleting a specific row of Vehicle / Engine Information in a Test Group / Engine Family table. Clicking the button at the end of a row will delete the a Vehicle / Engine information for just that row.

VW FOIA, EPA 06/20/2017 2017-FFP_028278

DEFECT DECRIPTION:

MIL On.

These changes will assist in reducing MIL illumination for DTC P0401 & P2463, thus reducing the frequency of unnecessary replacement of after treatment system components.

In addition, the vehicle's engine management software strategy has been modified to optimize the PM filter loading and regeneration model under extreme driving conditions.

Improved Part numbers / SW levels:

03L 906 019 JS / 8183

03L 906 019 JT / 8184

03L 906 019 KA / 8185

03L 906 019 KB / 8186

03L 906 019 KD / 8182

03L 906 019 KC / 8181

03L 906 019 CT, CM, CL, DB, DA / 9971

03L 906 022 KB, PB, SQ / 9971

03L 906 019 EJ / 8186

03L 906 019 EE / 8177

03L 906 019 HG / 8178

03L 906 019 EH / 8179

03L 906 019 HH / 8180

03L 906 019 HD / 8175

03L 906 019 HB / 8169

03L 906 019 HC / 8170

03L 906 019 AN / 8171

03L 906 019 AP / 8172

03L 906 019 HN / 8173 & 03L 906 019 HE / 8174

Describe the specific modifications:

Volkswagen Group of America, Inc. will pro-actively release an Emissions Service Action with Customer notification to upgrade ECM Software levels on the affected vehicles.

These changes will assist in reducing MIL illumination for DTC P0401 & P2463, thus reducing the frequency of unnecessary replacement of after treatment system components.

In addition, the vehicle's engine management software strategy has been modified to optimize the PM filter loading and regeneration model under extreme driving conditions.

Dealer Notification: On or about April 7th, 2015

Customer Notification: On or about April 7th, 2015

IMPORTANT INFORMATION
Please inform and provide a copy of this document to every person in your dealership with campaign-related responsibilities, including Service, Parts and Accounting personnel. By law, dealers must correct, prior to delivery for sale or lease, any vehicle that fails to comply with an applicable Federal Motor Vehicle Safety Standard or that contains a defect relating to motor vehicle safety. If you have questions regarding this or any other campaign, please contact Warranty.

Audi

Emissions Service Action
DRAFT 02/24/2015

Code: 23N4

Subject: Certain 2010 – 2014 Audi A3 with 2.0L TDI ® Clean Diesel Engine ECM Software Update

April 07, 2015

Problem Description
The vehicle's engine management software has been improved to assure the vehicle's tailpipe emissions are optimized and operating efficiently. Under certain operating conditions, the earlier strategy may have increased the chance of the vehicle's MIL light illuminating. If the MIL illuminates for any reason, the vehicle will not pass an IM emissions inspection in some regions.

Corrective Action
Install updated ECM software.

Affected Vehicles

U.S.A. and CANADA:

2010-2014 Audi A3 with 2.0L TDI® Clean Diesel Engine

Verify the open Campaigns/Actions screen in Elsa to determine if the VIN# applies to this Campaign/Action

NOTE:

- *Elsa is the only valid campaign inquiry/verification source. Check Elsa on the day the campaign work will be performed to verify vehicle eligibility for the repair in order to receive claim payment consideration. Campaign status must show "open".*
- *If this repair appears to have already been performed on the vehicle but the code still shows open in Elsa, contact Warranty before proceeding further, e.g. a dealer may have recently performed this repair but not yet entered a claim for it in the system.*
- *Elsa may also show additional open action(s); if so, inform your customer - this work can be done while the vehicle is in for this campaign.*
- *Contact Warranty if you have any questions.*

Inventory Vehicle Open Campaign/Action Report (AIM)
On or about April 07, 2015, affected vehicles will be listed on the Inventory Vehicle Open Campaign Action report under My Dealership Reports (found on www.accessaudi.com & AIM). A list will not be posted for dealers who do not have any affected vehicles.

Parts Information and Allocation
This action is a software update only; no parts are required.

Owner Notification Mailing
On or about April 07, 2015, the owner mailing will take place. A sample copy of the owner letter is enclosed.

Requirements for Emissions Campaigns Having Customer Notification (CALIFORNIA ONLY)
The California Air Resources Board and the Department of Motor Vehicles (DMV) require emissions-related campaigns to be completed prior to vehicle registration renewal. **When campaign work is done you must provide the owner with a signed "Vehicle Emission Recall – Proof of Correction" certificate (RC EMISCAVWAU).** Certificates can be ordered at no cost online via the Compliance Label Ordering portal at www.accessaudi.com.

Campaign Completion Labeling Guidelines
Vehicles repaired under this action must be identified with a campaign completion label (part number CAMP 010 000). Labels can be ordered at no cost online via the Compliance Label Ordering portal at www.accessaudi.com.

The repair information in this document is intended for use only by skilled technicians who have the proper tools, equipment and training to correctly and safely maintain your vehicle. These procedures are not intended to be attempted by "do-it-yourselfers," and you should not assume this document applies to your vehicle, or that your vehicle has the condition described. VW FOIA, EPA 06/20/2017 2017-FFP_028282

Subject : Emissions Service Action 23N4 – ECM Software
Certain 2010-2014 Model Year Audi A3 with 2.0L TDI® Clean Diesel Engine

Dear Audi Owner,

As part of Audi's ongoing commitment to our environment, and in cooperation with the United States Environmental Protection Agency and the California Air Resources Board, we are informing you of our decision to conduct an emissions service action on certain 2010-2014 model year Audi A3 2.0L TDI® Clean Diesel engine vehicles. Our records show that you are the owner of a vehicle affected by this action.

What is the issue, and what will we do?

The vehicle's engine management software has been improved to assure your vehicle's tailpipe emissions are optimized and operating efficiently. Under certain operating conditions, the earlier strategy may have increased the chance of the vehicle's MIL light illuminating. If the MIL illuminates for any reason, your vehicle will not pass an IM emissions inspection in some regions.

To address this issue, your authorized Audi dealer will update the ECM software in your vehicle. This work will take about one hour to complete and will be performed for you free of charge. Please keep in mind that your dealer may need additional time for the preparation of the repair, as well as to accommodate their daily workshop schedule.

IMPORTANT!
Please note that if the ECM in your vehicle has been "chipped," "tuned," or otherwise modified from original factory specifications with aftermarket components and/or software, work needed to repair, replace, or return the ECM to original factory specifications is NOT covered under this action.

What should you do?

In order to limit any possible inconvenience, please contact your authorized Audi dealer as soon as possible to schedule this service.

Lease vehicles and address changes

If you are the lessor and registered owner of the vehicle identified in this action, please forward this letter immediately via first-class mail to the lessee within ten (10) days of receipt. If you have changed your address or sold the vehicle, please fill out the enclosed prepaid Owner Reply card and mail it to us so we can update our records.

Reimbursement of Expenses

If you have previously paid for repairs relating to the condition described in this letter, the enclosed form explains how to request reimbursement. We would be pleased to review your reimbursement request.

Can we assist you further?

If your authorized Audi dealer fails or is unable to complete this work free of charge within a reasonable time, please call or write to:

Audi of America, Inc.,
Attn: Customer Experience (23N4)
3800 Hamlin Road, Auburn Hills, MI 48326
1-800-253-2834
www.audiusa.com

Checking your vehicle for open Recalls and Service Campaigns

To check your vehicle's eligibility for repair under this or any other recall/service campaign, please visit the ***Recall/Service Campaign Lookup*** tool at www.audiusa.com and enter your Vehicle Identification Number (VIN). As always, if you have any questions or if you need additional assistance, please contact Customer Experience or your authorized Audi dealer.

We apologize for any inconvenience this matter may cause; however we are taking this action to help ensure your vehicle continues to meet and exceed your expectations. Thank you for your continued loyalty!

Sincerely,

Audi Customer Protection

The repair information in this document is intended for use only by skilled technicians who have the proper tools, equipment and training to correctly and safely maintain your vehicle. These procedures are not intended to be attempted by "do-it-yourselfers," and you should not assume this document applies to your vehicle, or that your vehicle has the condition described. If you have changed your address or sold the vehicle, please fill out the enclosed prepaid Owner Reply card and mail it to us so we can update our records.

Important information for California Vehicle Owners – California Regulations

California regulations require that this campaign be completed prior to the time you renew your vehicle registration. Therefore, **please make sure that this campaign is completed prior to the renewal of your vehicle registration**, and that you furnish proof of completion to the Department of Motor Vehicles (DMV) in the form of a copy of the dealer's repair order, including a signed "Proof of Correction" certificate. You obtain this from your dealer after the campaign has been completed. Please retain the signed "Proof of Correction Certificate" with your vehicle records. DO NOT MAIL THIS FORM to the DMV, unless requested.

Reimbursement of Expenses

If you have previously paid for repairs relating to the condition described in this letter, the enclosed form explains how to request reimbursement. We would be pleased to review your reimbursement request.

Can we assist you further?

If your authorized Audi dealer fails or is unable to complete this work free of charge within a reasonable time, please call or write to:

Customer Letter Example (CANADA)

Subject : Emissions Service Action 23N4 – ECM Software
Certain 2010-2014 Model Year Audi A3 with 2.0L TDI® Clean Diesel Engine

Dear Audi Owner,

This notice is sent to you in accordance with the requirements of the *Canadian Environmental Protection Act, 1999.* Audi has determined that a defect, which relates to a prescribed emission standard, exists in certain 2010-2014 model year Audi A3 2.0L TDI® Clean Diesel engine vehicles. Our records show that you are the owner of a vehicle affected by this action.

What is the issue, and what will we do?

The vehicle's engine management software has been improved to assure your vehicle's tailpipe emissions are optimized and operating efficiently. Under certain operating conditions, the earlier strategy may have increased the chance of the vehicle's MIL light illuminating. If the MIL illuminates for any reason, your vehicle will not pass an IM emissions inspection in some regions.

To address this issue, your authorized Audi dealer will update the ECM software in your vehicle. This work will take about one hour to complete and will be performed for you free of charge. Please keep in mind that your dealer may need additional time for the preparation of the repair, as well as to accommodate their daily workshop schedule.

IMPORTANT!
Please note that if the ECM in your vehicle has been "chipped," "tuned," or otherwise modified from original factory specifications with aftermarket components and/or software, work needed to repair, replace, or return the ECM to original factory specifications is NOT covered under this action.

What should you do?

In order to limit any possible inconvenience, please contact your authorized Audi dealer as soon as possible to schedule this service. On or about April 07, 2015 the necessary repair instructions and parts will be available to your authorized Audi dealer.

Lease vehicles and address changes

If you are the lessor and registered owner of the vehicle identified in this action, please forward this letter immediately via first-class mail to the lessee within ten (10) days of receipt. If you have changed your address or sold the vehicle, please fill out the enclosed prepaid Owner Reply card and mail it to us so we can update our records.

Reimbursement of Expenses

If you have previously paid for repairs relating to the condition described in this letter, the enclosed form explains how to request reimbursement. We would be pleased to review your reimbursement request.

Can we assist you further?

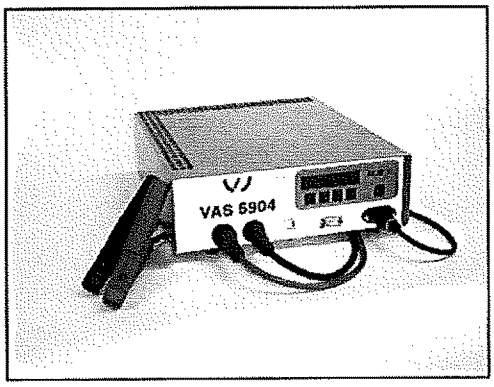
If there are questions regarding the work procedure:

- **U.S. dealers, contact Warranty**
- **Canadian dealers, open an ATA ticket using concern group "Compliance_Recall Assistance (C)"**

Required Tools:

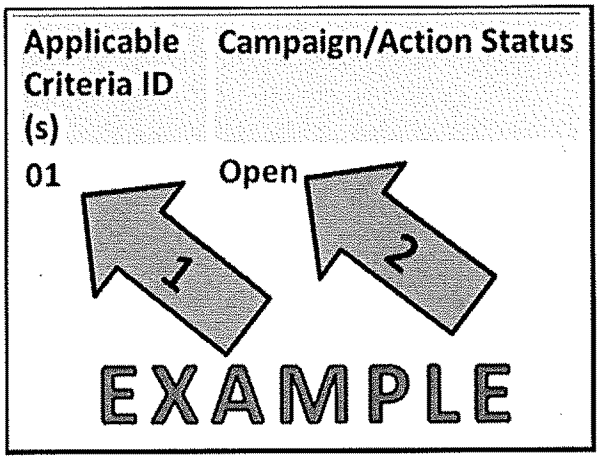
- Diagnostic tester



- Battery charger with charging current of **at least 30A**.

Required Parts:
NONE – Software update only

The repair information in this document is intended for use only by skilled technicians who have the proper tools, equipment and training to correctly and safely maintain your vehicle. These procedures are not intended to be attempted by "do-it-yourselfers," and you should not assume this document applies to your vehicle, or that your vehicle has the condition described. To determine whether this information applies, contact an authorized Audi dealer. ©2015 Audi of America, Inc. and Audi Canada. All Rights Reserved.



TIP

If Campaign Completion label is present, no further work is required

Section A – Check for Previous Repair

- Enter the VIN in Elsa and proceed to the "Campaign/Action" screen

TIP

On the date of repair, print this screen and keep a copy with the repair order

⇐ Ensure that the Status is "Open" <arrow 2>

⇐ Note the Applicable Criteria ID <arrow 1> for use in determining the correct work to be done and corresponding parts associated

- **Proceed to Section B.**

The repair information in this document is intended for use only by skilled technicians who have the proper tools, equipment and training to correctly and safely maintain your vehicle. These procedures are not intended to be attempted by "do-it-yourselfers," and you should not assume this document applies to your vehicle, or that your vehicle has the condition described. - Follow the on-screen prompts
- Close the hood

Continue to Section C

Section C – Campaign Completion Label

Install Campaign Completion Label

- Open the hood.
- Fill out and affix Campaign Completion label, part number CAMP 010 000, next to the vehicle emission control information label

TIP

Ensure Campaign Completion label does not cover any existing label(s)

- Close the hood.

Continue to Section D – Campaign Stamp

Campaign Stamp

⇐ Once the campaign has been completed, the technician should stamp the repair order.

- Stamps are available for ordering through the Compliance Label Ordering Portal.

I certify that this campaign has been performed in strict accordance with the applicable Audi repair procedure.

Subject : Emissions Service Action 23N4 – ECM Software
Certain 2010-2014 Model Year Audi A3 with 2.0L TDI® Clean Diesel Engine

Audi of America, Inc.
3800 Hamlin Road
Auburn Hills, MI 48326
+1 800 253 2834
www.audiusa.com

Dear Audi Owner,

As part of Audi's ongoing commitment to our environment, and in cooperation with the United States Environmental Protection Agency and the California Air Resources Board, we are informing you of our decision to conduct an emissions service action on certain 2010-2014 model year Audi A3 2.0L TDI® Clean Diesel engine vehicles. Our records show that you are the owner of a vehicle affected by this action.

What is the issue, and what will we do?

The vehicle's engine management software has been improved to assure your vehicle's tailpipe emissions are optimized and operating efficiently. Under certain operating conditions, the earlier strategy may have increased the chance of the vehicle's MIL light illuminating. If the MIL illuminates for any reason, your vehicle will not pass an IM emissions inspection in some regions.

To address this issue, your authorized Audi dealer will update the ECM software in your vehicle. This work will take about one hour to complete and will be performed for you free of charge. Please keep in mind that your dealer may need additional time for the preparation of the repair, as well as to accommodate their daily workshop schedule.

IMPORTANT!
Please note that if the ECM in your vehicle has been "chipped," "tuned," or otherwise modified from original factory specifications with aftermarket components and/or software, work needed to repair, replace, or return the ECM to original factory specifications is NOT covered under this action.

What should you do?

In order to limit any possible inconvenience, please contact your authorized Audi dealer as soon as possible to schedule this service.

Lease vehicles and address changes

If you are the lessor and registered owner of the vehicle identified in this action, please forward this letter immediately via first-class mail to the lessee within ten (10) days of receipt. If you have changed your address or sold the vehicle, please fill out the enclosed prepaid Owner Reply card and mail it to us so we can update our records.

23N4 USA_49S

Audi

Reimbursement of Expenses	If you have previously paid for repairs relating to the condition described in this letter, the enclosed form explains how to request reimbursement. We would be pleased to review your reimbursement request.
Can we assist you further?	If your authorized Audi dealer fails or is unable to complete this work free of charge within a reasonable time, please call or write to: Audi of America, Inc., Attn: Customer Experience (23N4) 3800 Hamlin Road, Auburn Hills, MI 48326 1-800-253-2834 www.audiusa.com
Checking your vehicle for open Recalls and Service Campaigns	To check your vehicle's eligibility for repair under this or any other recall/service campaign, please visit the ***Recall/Service Campaign Lookup*** tool at www.audiusa.com and enter your Vehicle Identification Number (VIN). As always, if you have any questions or if you need additional assistance, please contact Customer Experience or your authorized Audi dealer.

We apologize for any inconvenience this matter may cause; however we are taking this action to help ensure your vehicle continues to meet and exceed your expectations. Thank you for your continued loyalty!

Sincerely,

Audi Customer Protection

As always, if you have any questions or if you need additional assistance, please contact Customer Experience or your authorized Audi dealer.

We apologize for any inconvenience this matter may cause; however we are taking this action to help ensure your vehicle continues to meet and exceed your expectations. Thank you for your continued loyalty!

Sincerely,

Audi Customer Protection

IMPORTANT INFORMATION
Please inform and provide a copy of this document to every person in your dealership with campaign-related responsibilities, including Service, Parts and Accounting personnel. By law, dealers must correct, prior to delivery for sale or lease, any vehicle that fails to comply with an applicable Federal Motor Vehicle Safety Standard or that contains a defect relating to motor vehicle safety. If you have questions regarding this or any other campaign, please contact Warranty.

Das Auto.

Emissions Service Action
DRAFT 02/24/2015

Code: 23O6

Subject: Certain 2010-2014 Volkswagen Vehicles with 2.0L TDI® Clean Diesel Engine ECM Software Update

April 07, 2015

Problem Description
The vehicle's engine management software has been improved to assure the vehicle's tailpipe emissions are optimized and operating efficiently. Under certain operating conditions, the earlier strategy may have increased the chance of the vehicle's MIL light illuminating. If the MIL illuminates for any reason, the vehicle will not pass an IM emissions inspection in some regions.

Corrective Action
Install updated ECM software.

Affected Vehicles

U.S.A. and CANADA:

2010-2014 Beetle, Beetle Convertible, Jetta, Golf, Jetta SportWagen/Golf Wagon with 2.0L TDI® Clean Diesel engine

Verify the open Campaigns/Actions screen in Elsa to determine if the VIN# applies to this Campaign/Action

NOTE:

- *Elsa is the only valid campaign inquiry/verification source. Check Elsa on the day the campaign work will be performed to verify vehicle eligibility for the repair in order to receive claim payment consideration. Campaign status must show "open".*
- *If this repair appears to have already been performed on the vehicle but the code still shows open in Elsa, contact Warranty before proceeding further, e.g. a dealer may have recently performed this repair but not yet entered a claim for it in the system.*
- *Elsa may also show additional open action(s); if so, inform your customer - this work can be done while the vehicle is in for this campaign.*
- *Contact Warranty if you have any questions.*

Inventory Vehicle Open Campaign/Action Report (VIM)
On or about April 07, 2015, affected vehicles will be listed on the Inventory Vehicle Open Campaign Action report under My Dealership Reports (found on www.vwhub.com & VIM). A list will not be posted for dealers who do not have any affected vehicles.

Parts Information and Allocation
This action is a software update only; no parts are required.

Owner Notification Mailing
On or about April 07, 2015, the owner mailing will take place. A sample copy of the owner letter is enclosed.

Requirements for Emissions Campaigns Having Customer Notification (CALIFORNIA ONLY)
The California Air Resources Board and the Department of Motor Vehicles (DMV) require emissions-related campaigns to be completed prior to vehicle registration renewal. **When campaign work is done you must provide the owner with a signed "Vehicle Emission Recall – Proof of Correction" certificate (RC EMISCAVWAU).** Certificates can be ordered at no cost online via the Compliance Label Ordering portal at www.vwhub.com.

Campaign Completion Labeling Guidelines
Vehicles repaired under this action must be identified with a campaign completion label (part number CAMP 010 000). Labels can be ordered at no cost online via the Compliance Label Ordering portal at www.vwhub.com.

The repair information in this document is intended for use only by skilled technicians who have the proper tools, equipment and training to correctly and safely maintain your vehicle. These procedures are not intended to be attempted by "do-it-yourselfers," and you should not assume this document applies to your vehicle, or that your vehicle has the condition described. Customer Letter Example (United States – 49 states)

Subject: **Emissions Service Action 23O6 – ECM Software**
Certain 2010-2014 Model Year Volkswagen Vehicles Equipped with a 2.0L TDI® Clean Diesel Engine

Dear Volkswagen Owner,

As part of Volkswagen's ongoing commitment to our environment, and in cooperation with the United States Environmental Protection Agency, we are informing you of our decision to conduct an emissions service action on certain 2010-2014 model year Volkswagen vehicles equipped with a 2.0L TDI® Clean Diesel engine. Our records show that you are the owner of a vehicle affected by this action.

What is the issue, and what will we do?

The vehicle's engine management software has been improved to assure your vehicle's tailpipe emissions are optimized and operating efficiently. Under certain operating conditions, the earlier strategy may have increased the chance of the vehicle's MIL light illuminating. If the MIL illuminates for any reason, your vehicle will not pass an IM emissions inspection in some regions.

To address this issue, your authorized Volkswagen dealer will update the ECM software in your vehicle. This work will take about one hour to complete and will be performed for you free of charge. Please keep in mind that your dealer may need additional time for the preparation of the repair, as well as to accommodate their daily workshop schedule.

IMPORTANT!
Please note that if the ECM in your vehicle has been "chipped," "tuned," or otherwise modified from original factory specifications with aftermarket components and/or software, work needed to repair, replace, or return the ECM to original factory specifications is NOT covered under this action.

What should you do?

In order to limit any possible inconvenience, please contact your authorized Volkswagen dealer as soon as possible to schedule this service.

Lease vehicles and address changes

If you are the lessor and registered owner of the vehicle identified in this action, please forward this letter immediately via first-class mail to the lessee within ten (10) days of receipt. If you have changed your address or sold the vehicle, please fill out the enclosed prepaid Owner Reply card and mail it to us so we can update our records.

Reimbursement of Expenses

If you have previously paid for repairs relating to the condition described in this letter, the enclosed form explains how to request reimbursement. We would be pleased to review your reimbursement request.

Can we assist you further?

If your authorized Volkswagen dealer fails or is unable to complete this work free of charge within a reasonable time, please call or write to:

Customer Letter Example (CANADA)

Subject: **Emissions Service Action 23O6 – ECM Software**
Certain 2010-2014 Model Year Volkswagen Vehicles Equipped with a 2.0L TDI® Clean Diesel Engine

Dear Volkswagen Owner,

This notice is sent to you in accordance with the requirements of the *Canadian Environmental Protection Act, 1999*. Volkswagen has determined that a defect, which relates to a prescribed emission standard, exists in certain 2010-2014 model year Volkswagen vehicle equipped with a 2.0L TDI® Clean Diesel engine. Our records show that you are the owner of a vehicle affected by this action.

What is the issue, and what will we do?

The vehicle's engine management software has been improved to assure your vehicle's tailpipe emissions are optimized and operating efficiently. Under certain operating conditions, the earlier strategy may have increased the chance of the vehicle's MIL light illuminating. If the MIL illuminates for any reason, your vehicle will not pass an IM emissions inspection in some regions.

To address this issue, your authorized Volkswagen dealer will update the ECM software in your vehicle. This work will take about one hour to complete and will be performed for you free of charge. Please keep in mind that your dealer may need additional time for the preparation of the repair, as well as to accommodate their daily workshop schedule.

IMPORTANT!
Please note that if the ECM in your vehicle has been "chipped," "tuned," or otherwise modified from original factory specifications with aftermarket components and/or software, work needed to repair, replace, or return the ECM to original factory specifications is NOT covered under this action.

What should you do?

In order to limit any possible inconvenience, please contact your authorized Volkswagen dealer as soon as possible to schedule this service. On or about April 07, 2015 the necessary repair instructions will be available to your authorized Volkswagen dealer.

Lease vehicles and address changes

If you are the lessor and registered owner of the vehicle identified in this action, please forward this letter immediately via first-class mail to the lessee within ten (10) days of receipt. VW FOIA, EPA 06/20/2017 2017-FFP_028300

NOTE

Prior to launching VAS Diagnostic Device application and starting control module update process, confirm tester screen saver and power settings are off.

Failure to do so may result in the tester entering power save mode during data transfer, and subsequent control module failure.

When using any tester in conjunction with a VAS 5054A wireless transmitter head for a flash procedure:

- Connect the tester using an Ethernet "hard line" cable between the tester and the on-line network. DO NOT USE WI-FI.
- Connect a USB cable between the transmitter head and the tester. Failure to do so may lead to errors during the flash procedure.
- **DISABLE BLUETOOTH and ensure that the tester is NOT communicating via Bluetooth as the Bluetooth protocol is not a robust data transfer environment for the flash process. DO NOT USE BLUETOOTH for flashing. Control module failures caused by flashing via Bluetooth will not be covered.**

All Volkswagen scan tool devices must only be used with their power adapters plugged in. Under no circumstances should they be used on battery power alone during the programming procedure.

Critical Warning: The Midtronics Battery Charger **must** be connected to the vehicle battery for the duration of the programming, to ensure the battery state of charge remains above 12.5 volts during the update process. If the battery drops below 12.5 volts, the programming could fail which may result in damage to the control module.

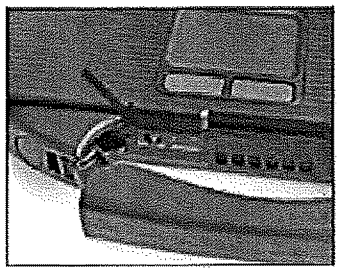
The technician should verify the vehicle voltage prior to starting the update process, and should monitor the voltage for the duration of the update.

Control modules damaged by insufficient voltage will not be covered.

WARNING

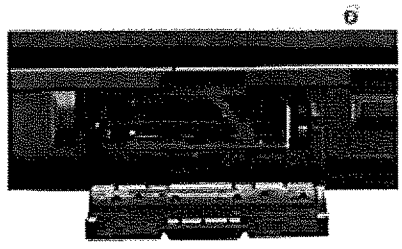
Radiator Fan(s) may cycle ON high speed during the Update Process! There is a serious risk that personal injury may result if contact is made with spinning fan blades. Keep hands and all objects away from Radiator Fan(s) during Update Process!

The repair information in this document is intended for use only by skilled technicians who have the proper tools, equipment and training to correctly and safely maintain your vehicle. These procedures are not intended to be attempted by "do-it-yourselfers," and you should not assume this document applies to your vehicle, or that your vehicle has the condition described. To determine whether this information applies, contact an authorized Volkswagen dealer. ©2015 Volkswagen Group of America, Inc. and Volkswagen Canada. All Rights Reserved.



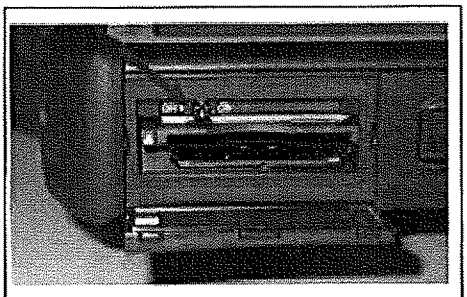
VAS 6150 & VAS 6150A

(Front panel behind handle)



VAS 6150B

(Middle right side behind WIRELESS door)



VAS 6160/-VPC

(Upper left side behind SC/EX door)

- Switch the ignition OFF.
- Switch off the headlights, radio, HVAC, and all other battery consumers.
- Open the hood.
- If necessary, open/remove the battery cover.
- Connect the battery charger to the vehicle.
- Connect the VAS tester to the online network using an Ethernet cable.
- Connect the VAS 5054A transmitter head to the VAS tester using the USB cable.
- Disable the Bluetooth by physically turning the switch to the "off" position.

NOTE

If the Bluetooth wireless VAS 5054A transmitter head is used in conjunction with a VAS tester, the transmitter head MUST BE connected with a USB cable to the tester.

WARNING

The Bluetooth function of the scan tool **MUST BE PHYSICALLY SWITCHED OFF** prior to performing this update. <See pictures>

The repair information in this document is intended for use only by skilled technicians who have the proper tools, equipment and training to correctly and safely maintain your vehicle. These procedures are not intended to be attempted by "do-it-yourselfers," and you should not assume this document applies to your vehicle, or that your vehicle has the condition described. To determine whether this information applies, contact an authorized Volkswagen dealer. ©2015 Volkswagen Group of America, Inc. and Volkswagen Canada. All Rights Reserved.

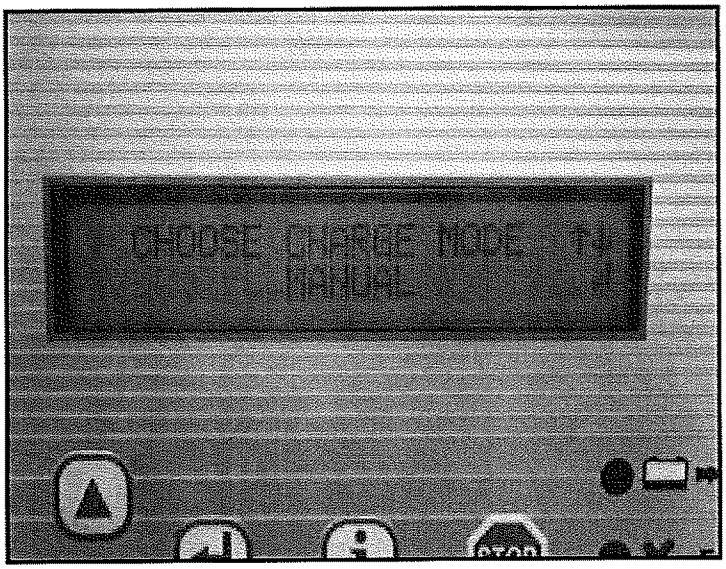
Prerequisites for SVM software update

1. Ensure the customer's vehicle condition matches the conditions stated in the Campaign Circular.
2. Ensure the user has a valid GeKo ID and password.
3. Only perform operations explicitly stated in the Campaign Circular.
4. Ensure that the following tester requirements are met:
   - Off-board Diagnostic Information System Service (ODIS) is installed and up to date.
   - VAS tester is plugged into a 120V AC power supply at all times.
   - The VAS tester is connected, via wired connection, to the internet.
   - The VAS tester is connected via USB cable to the VAS5054A Bluetooth head **PRIOR** to launching the ODIS program.

⚠ CAUTION

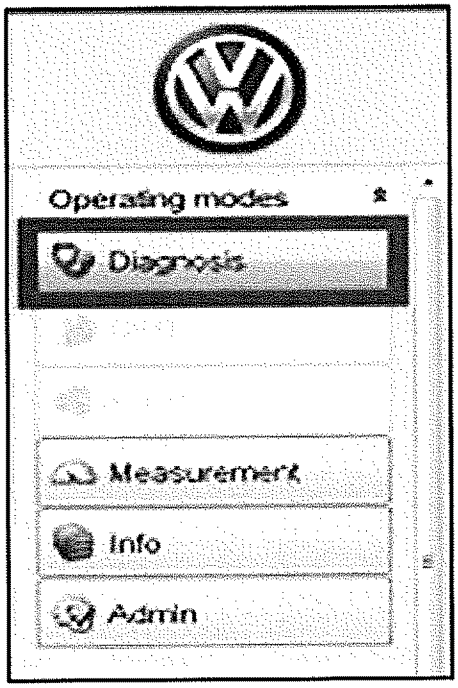
Prior to launching the ODIS application and starting the control module update process, confirm the tester screensaver and power settings are in accordance with Special Tools and Equipment - Service Information Document # VSE-08-18. Failure to do so may result in the tester entering power save mode during data transfer andsubsequent control module failure. When performing a flash procedure using a VAS tester in conjunction with a VAS 5054A wireless transmitter head, please connect a USB cable between the transmitter head and the tester. Failure to do so may lead to errors during the flash procedure and may damage control modules.

The repair information in this document is intended for use only by skilled technicians who have the proper tools, equipment and training to correctly and safely maintain your vehicle. These procedures are not intended to be attempted by "do-it-yourselfers," and you should not assume this document applies to your vehicle, or that your vehicle has the condition described. To determine whether this information applies, contact an authorized Volkswagen dealer. ©2015 Volkswagen Group of America, Inc. and Volkswagen Canada. All Rights Reserved.



⇐ Install the inCharge 940 battery tester onto the vehicle, switch the tester on, then select the "manual" option <as shown>.

- Follow the on screen prompts to charge the battery during the SVM procedure.



- Switch the ignition on.
- Apply the parking brake.
- Switch the headlights off.
- Attach an appropriate VAS tester to the vehicle.
- Start the ODIS program.

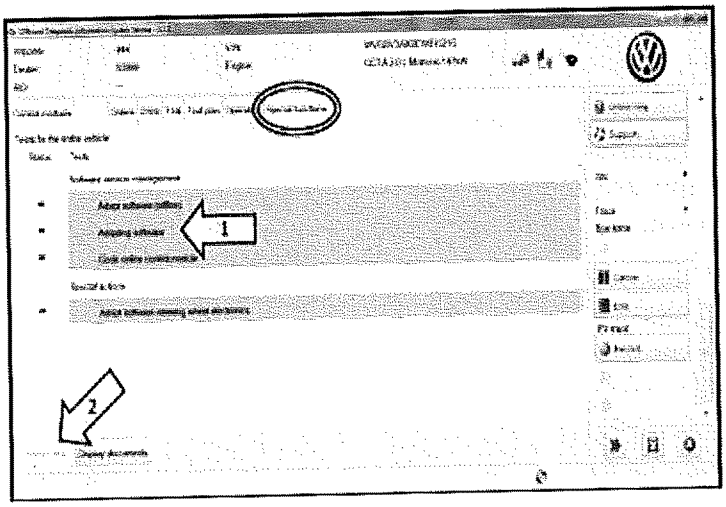
⇐ Upon ODIS startup, verify the "Diagnosis" operating mode is selected <as shown>.

- Using ODIS, perform a Guided Fault Finding scan of the vehicle.

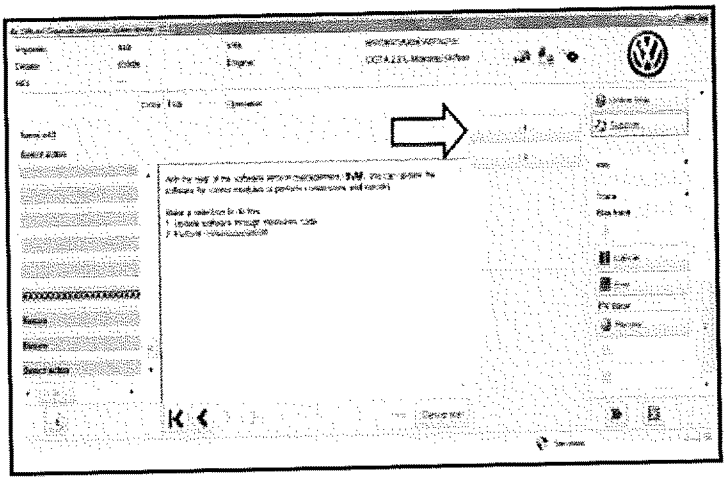
NOTE

If GFF does not interrogate all control modules, manually select and interrogate remaining modules before proceeding. Address or record all DTCs related to a customer concern before continuing. Sporadic communication DTCs will be created during the flash procedure and must be erased with all other sporadic DTCs by GFF after exiting the flash test plan.

The repair information in this document is intended for use only by skilled technicians who have the proper tools, equipment and training to correctly and safely maintain your vehicle. These procedures are not intended to be attempted by "do-it-yourselfers," and you should not assume this document applies to your vehicle, or that your vehicle has the condition described. To determine whether this information applies, contact an authorized Volkswagen dealer. ©2015 Volkswagen Group of America, Inc. and Volkswagen Canada. All Rights Reserved.



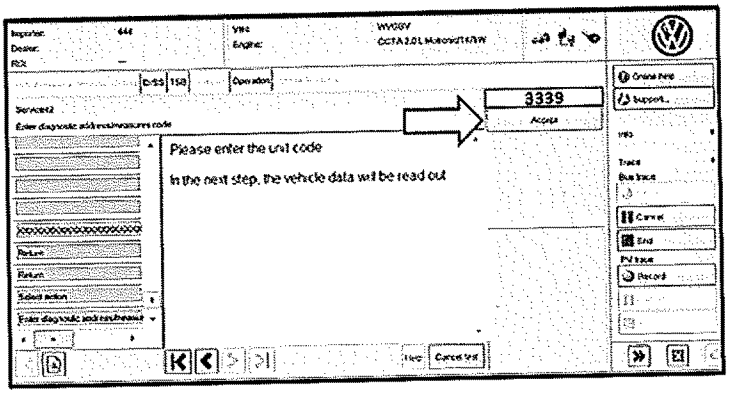
⇐ Once the GFF scan is complete, select "Special functions" <circle>, then "Adapting Software" <arrow 1>, then select "Perform test" <arrow 2>.



⇐ Select the appropriate option to update "**through measures code**" <arrow>.

NOTE

Read this screen carefully. The option to update software through measures code is **NOT** always selection #1 on this screen.



⇐ Enter "**3339**" <as shown>.

⇐ Select "Accept" <arrow>.

The repair information in this document is intended for use only by skilled technicians who have the proper tools, equipment and training to correctly and safely maintain your vehicle. Subject: **Emissions Service Action 23O6 – ECM Software**
Certain 2010-2014 Model Year Volkswagen Vehicles Equipped with a 2.0L TDI® Clean Diesel Engine

Dear Volkswagen Owner,

As part of Volkswagen's ongoing commitment to our environment, and in cooperation with the United States Environmental Protection Agency, we are informing you of our decision to conduct an emissions service action on certain 2010-2014 model year Volkswagen vehicles equipped with a 2.0L TDI® Clean Diesel engine. Our records show that you are the owner of a vehicle affected by this action.

What is the issue, and what will we do?

The vehicle's engine management software has been improved to assure your vehicle's tailpipe emissions are optimized and operating efficiently. Under certain operating conditions, the earlier strategy may have increased the chance of the vehicle's MIL light illuminating. If the MIL illuminates for any reason, your vehicle will not pass an IM emissions inspection in some regions.

To address this issue, your authorized Volkswagen dealer will update the ECM software in your vehicle. This work will take about one hour to complete and will be performed for you free of charge. Please keep in mind that your dealer may need additional time for the preparation of the repair, as well as to accommodate their daily workshop schedule.

IMPORTANT!
Please note that if the ECM in your vehicle has been "chipped," "tuned," or otherwise modified from original factory specifications with aftermarket components and/or software, work needed to repair, replace, or return the ECM to original factory specifications is NOT covered under this action.

What should you do?

In order to limit any possible inconvenience, please contact your authorized Volkswagen dealer as soon as possible to schedule this service.

23O6/D8 USA

Lease vehicles and address changes	If you are the lessor and registered owner of the vehicle identified in this action, please forward this letter immediately via first-class mail to the lessee within ten (10) days of receipt. If you have changed your address or sold the vehicle, please fill out the enclosed prepaid Owner Reply card and mail it to us so we can update our records.
Reimbursement of Expenses	If you have previously paid for repairs relating to the condition described in this letter, the enclosed form explains how to request reimbursement. We would be pleased to review your reimbursement request.
Can we assist you further?	If your authorized Volkswagen dealer fails or is unable to complete this work free of charge within a reasonable time, please call or write to: Volkswagen of America, Inc., Attn: Customer CARE (23O6) 3800 Hamlin Road, Auburn Hills, MI 48326 1-800-893-5298 www.vw.com
Checking your vehicle for open Recalls and Service Campaigns	To check your vehicle's eligibility for repair under this or any other recall/service campaign, please visit the ***Recall/Service Campaign Lookup*** tool at www.vw.com and enter your Vehicle Identification Number (VIN). As always, if you have any questions or if you need additional assistance, please contact Customer CARE or your authorized Volkswagen dealer.

We apologize for any inconvenience this matter may cause; however we are taking this action to help ensure your vehicle continues to meet and exceed your expectations. Thank you for driving a Volkswagen!

Sincerely,
Volkswagen Customer Protection

RE: Petition for Rulemaking to Implement New Emissions Testing for Motor Vehicles and Increase Penalties for Violations of Fuel Standards

Dear Administrator McCarthy and Administrator Rosekind,

The Center for Biological Diversity (the "Center") requests that you take immediate action to protect public health and the environment from the toxic impacts of greenhouse gas and nitrogen oxides emissions from motor vehicles, and from corporate practices designed to evade regulations restricting the quantity of these dangerous emissions. Specifically, pursuant to the Administrative Procedure Act, 5 U.S.C. § 553(e), Title II of the Clean Air Act ("CAA"), 42 U.S.C. §§ 7521-7554, and Title VI of the Energy Policy and Conservation Act ("EPCA"), 49 U.S.C. §§ 32901-32919, the Center requests that the U.S. Environmental Protection Agency ("EPA") and the National Highway Traffic Safety Administration ("NHTSA"):

(1) immediately conduct in-use emissions testing of each make and model of diesel-powered motor vehicles sold in the United States since 2009 that have not previously undergone such tests;

(2) immediately conduct in-use emissions testing of each make and model of other fossil fuel-powered motor vehicles sold in the United States since 2009 that have not previously undergone such tests;

(3) promulgate regulations to require on-road emissions testing for all types of new diesel-powered motor vehicles;

Alaska · Arizona · California · Florida · Minnesota · Nevada · New Mexico · New York · Oregon · Vermont · Washington, DC
Kristen Monsell, Staff Attorney, Oceans Program · 1212 Broadway, Suite 800 · Oakland, CA 94612
Phone: 510-844-7100 x 337 · Fax: 510-844-7150 · kmonsell@biologicaldiversity.org

(4) promulgate regulations to require on-road emissions testing for all other types of new fossil fuel-powered motor vehicles; and

(5) promulgate regulations to increase the penalties for violations of corporate average fuel economy standards.

As you are well-aware, Volkswagen recently admitted that 11 million of its diesel cars sold worldwide since 2009, including nearly half a million sold in the United States, contain software specifically designed to cheat emissions tests. The software — known as "defeat devices" — can detect when a car is being tested in a laboratory setting and adjusts engine operations to emit less-polluting exhaust during the test than in real-world driving conditions. EPA has said that these devices allowed each car to spew up to *40 times* the legal limit of nitrogen oxides emissions in the United States. Accordingly, in addition to the specific actions requested above, **the Center also requests that EPA assess the maximum permissible penalties against VW for such egregious violations of law.**

This widespread fraud not only deceived consumers who purchased VW cars based on the belief the cars were "clean diesel," but is a significant threat to public health and the environment. Emissions of nitrogen oxides contribute to climate change and ocean acidification — nitrogen oxides react with other substances to form the greenhouse gas ozone, and contain a highly potent and long-lived greenhouse gas. In addition, ground-level ozone can trigger or worsen asthma and other respiratory ailments, make the lungs more susceptible to infection, damage vegetation and reduce crop yields. Nitrogen oxides are also a precursor to particulate matter which causes breathing problems, lung tissue damage and premature death.

To make matters worse, the use of such devices, and thus unlawful emissions of such dangerous pollutants, may not be limited to VW. Indeed, defeat devices have existed almost since the inception of the CAA, and EPA has previously levied fines against car and truck manufacturers for the use of such devices. Recent reports indicate that tests of on-road emissions of cars made by other companies exceed that of laboratory testing, indicating that these manufactures might also be using defeat devices — or, at a minimum, are not performing as required. Despite the existence of technology that can measure emissions during normal operation and use, EPA does not require such tests for the vast majority of motor vehicles.

And the recent scandal highlights yet another industry-wide problem — that car manufacturers routinely pay fines, rather than comply with mandatory fuel economy standards that seek to improve fuel efficiency and reduce carbon dioxide emissions. As we have frequently pointed out, and as government reports indicate, the meager fines are too low to act as a deterrent, thereby failing to inspire the technological innovation contemplated by EPCA and the CAA. Yet NHTSA has not increased the penalty for violation of the standards in nearly two decades.

Comprehensive action is therefore needed to ensure long-term solutions to such pervasive problems. Taking the actions requested in this petition will improve the accuracy of emissions testing of motor vehicles and help ensure against future deception, and incentivize compliance with fuel economy standards intended to reduce greenhouse gas emissions and improve energy security. In other words, granting this petition will help better protect public health and the

VW FOIA, EPA 06/20/2017 2017-FFP_028317

environment from dangerous air pollutants from motor vehicles, while ensuring fuel economy continues to improve as intended by the CAA and EPCA.[1] The Center requests that EPA and NHTSA take the regulatory actions requested in this petition within 180 days.

I. Factual Background: Harmful Emissions from Motor Vehicles

As the VW scandal demonstrates, motor vehicles emit harmful air pollutants. In fact, according to the Union of Concerned Scientists, transportation is the largest single source of air pollution in the United States.[2] Motor vehicles emit carbon dioxide, oxides of nitrogen, particulate matter, hydrocarbons, carbon monoxide, sulfur dioxide, as well as benzene and other hazardous air pollutants.[3] These emissions contribute to a myriad of public health problems, negative impacts to public welfare and the environment, and climate change.

A. Emissions from Motor Vehicles Are Harmful to Public Health

Motor vehicles emit air pollutants that cause or contribute to health problems, including nitrogen oxides. For example, ground level ozone is created by chemical reaction between nitrogen oxides and volatile organic compounds. Ground-level ozone pollution is linked to many public health impacts, especially those related to respiratory function. Ozone can irritate the respiratory tract and throat, impair lung function, and cause coughing, chest pains and lung inflammation.[4] EPA has recognized the association between ozone exposure and hospital visits for respiratory problems — especially for children — noting that ozone pollution is responsible for as much as twenty percent of all summertime respiratory hospital visits.[5] Ozone is also linked to the development of respiratory diseases, such as asthma.[6] But the health effects of ozone are not limited to respiratory illnesses. Ozone pollution is linked to other serious health impacts, such as heart disease and certain types of strokes.[7] "[M]ost importantly," according to the American Lung Association, ozone exposure and the associated health impacts can shorten lives

VW FOIA, EPA 06/20/2017 2017-FFP_028318

by months and even years.[8] "Even at very low levels including days that meet current regulatory requirements," ozone is associated with premature mortality.[9]

Ozone also has detrimental ecological effects. According to EPA, ozone "affects sensitive vegetation and ecosystems, including forests, parks, wildlife refuges, and wilderness areas," especially during growing seasons.[10] Ozone can interfere with a plant's ability to produce and store food, visibly damage leaves, and make plants susceptible to damage from disease, insects, competition and severe weather.[11]

Nitrogen oxides also mix with other air pollutants to create particulate matter ("PM"). The effects associated with PM exposure are "premature mortality, increased hospital admissions and emergency department visits, and development of chronic respiratory disease."[12] California has identified diesel PM as a toxic air contaminant and has estimated that 70 percent of the cancer risk from the air Californians breathe is attributable to diesel PM; EPA says that diesel PM is "likely to be a carcinogen."[13] Diesel exhaust is a major contributor to PM pollution. In fact, it is estimated that diesel-powered vehicles and equipment account for nearly half of all nitrogen oxides and more than two-thirds of all PM emissions from U.S. transportation sources.[14]

B. Emissions from Motor Vehicles Contribute to Climate Change

The burning of fossil fuels is the largest source of domestic greenhouse gas emissions, accounting for 77 percent of total warming emissions in 2013.[15] One of the primary sources of such emissions is from the transportation sector, which in 2013 accounted for 27 percent of all greenhouse gas emissions in the United States.[16] The largest source of such emissions from the transportation sector is passenger cars, representing nearly 43 percent of emissions in 2013.[17]

VW FOIA, EPA 06/20/2017 2017-FFP_028319

The transportation sector has been the fastest-growing source of greenhouse gas emissions since 1990.[18]

Carbon dioxide is the dominant greenhouse gas driving observed changes in the Earth's climate.[19] Emissions of nitrogen oxides also contribute to climate change through two primary means: (1) nitrogen oxides react with other substances to form the greenhouse gas ozone; and (2) nitrous oxide is itself a highly potent and long-lived greenhouse gas. Nitrous oxide behaves very similarly to carbon dioxide in that it both directly traps heat in the atmosphere and remains in existence for many decades once emitted.[20]

There is a strong, international scientific consensus that anthropogenic climate threatens human society and natural systems. The U.S. Global Change Research Program in its 2009 report *Climate Change Impacts in the United States* similarly stated that "global warming is unequivocal and primarily human-induced" and "widespread climate-related impacts are occurring now and are expected to increase."[21] The U.S. National Research Council similarly concluded that "[c]limate change is occurring, is caused largely by human activities, and poses significant risks for — and in many cases is already affecting — a broad range of human and natural systems."[22] Based on observed and expected harms from climate change, in 2009 EPA concluded that greenhouse gas pollution endangers the health and welfare of current and future generations.[23] Current atmospheric concentrations of greenhouse gases are already resulting in significant climate change impacts that are projected to worsen as emissions rise.[24]

Key changes include warming temperatures, the increasing frequency of extreme weather events, rapidly melting glaciers, ice sheets, and sea ice and rising sea levels.[25] There will be significant costs associated with these changes. For example, in the United States in 2011 alone, a record 14 weather and climate disasters occurred, including droughts, heat waves, and floods, that cost at least $1 billion each in damages and loss of human lives.[26] In addition, air pollution components that trigger asthma attacks, specifically air particulates and ozone, are expected to increase with climate change;[27] in 2020, the continental United States could pay an average of

$5.4 billion (2008$) in health impact costs associated with the climate penalty on ozone, with California experiencing the greatest estimated impacts averaged at $729 million.[28]

Anthropogenic climate change also poses a significant threat to biodiversity. Climate change is already causing changes in distribution, phenology, physiology, genetics, species interactions, ecosystem services, demographic rates and population viability: many animals and plants are moving poleward and upward in elevation, shifting their timing of breeding and migration, and experiencing population declines and extirpations.[29] Because climate change is occurring at an unprecedented pace with multiple synergistic impacts, climate change is predicted to result in catastrophic species losses during this century.

The Intergovernmental Panel on Climate Change ("IPCC") concluded that 20 to 30 percent of plant and animal species will face an increased risk of extinction if global average temperature rise exceeds 1.5°C to 2.5°C relative to 1980-1999, with an increased risk of extinction for up to 70 percent of species worldwide if global average temperature exceeds 3.5°C relative to 1980-1999.[30] Other studies have predicted similarly severe losses: 15 to 37 percent of the world's plants and animals committed to extinction by 2050 under a mid-level emissions scenario;[31] the potential extinction of 10 to 14 percent of species by 2100 if climate change continues unabated;[32] and the loss of more than half of the present climatic range for 58 percent of plants and 35 percent of animals by the 2080s under the current emissions pathway, in a sample of 48,786 species.[33] Scientists have warned that the Earth is fast approaching a global "state-shift" that could result in unanticipated and rapid changes to Earth's biological systems.[34] As summarized by the 2014 National Climate Assessment, "landscapes and seascapes are changing rapidly, and species, including many iconic species, may disappear from regions where they have been prevalent or become extinct, altering some regions so much that their mix of plant and animal life will become almost unrecognizable."[35]

In addition, the ocean's absorption of anthropogenic greenhouse gas emissions, including both carbon dioxide and nitrogen oxides, has already resulted in more than a 30 percent increase

in the acidity of ocean surface waters, at a rate faster than anything believed to have occurred in the past 300 million years.[36] Ocean acidity is projected to increase by 150 to 200 percent by the end of the century if carbon dioxide emissions continue unabated.[37] Ocean acidification negatively affects a wide range of marine species by hindering the ability of calcifying marine creatures to build protective shells and skeletons and by disrupting metabolism and critical biological functions.[38] The adverse effects of ocean acidification are already being observed in wild populations, including reduced coral calcification rates,[39] dissolution of pteropod shells in the California Current,[40] reduced shell weights of foraminifera in the Southern Ocean,[41] and mass die-offs of larval Pacific oysters in the Pacific Northwest.[42]

II. Legal Background: The Regulation of Emissions from Motor Vehicles

Given the negative impacts on public health and the environment caused by the emission of air pollutants from various sources, including the transportation sector, Congress has enacted several laws to regulate and limit the amount of air pollutants from motor vehicles.

A. The Clean Air Act

In enacting the CAA, Congress found that "that the growth in the amount and complexity of air pollution brought about by urbanization, industrial development, *and the increasing use of*

motor vehicles, has resulted in mounting dangers to the public health and welfare, including injury to agricultural crops and livestock..."[43] Accordingly, the CAA establishes a comprehensive scheme "to protect and enhance the quality of the Nation's air resources so as to promote the public health and welfare and the productive capacity of its population."[44]

To reach these goals, Title II of the CAA prescribes a regulatory scheme to control emissions from mobile sources.[45] Specifically, the CAA requires EPA to promulgate regulations that establish standards for the emissions of air pollutants from new motor vehicles that "cause, or contribute to, air pollution which may reasonably be anticipated to endanger public health or welfare" and prohibits exceedances of those standards.[46] The CAA mandates that EPA set emission standards for particular pollutants from light and heavy duty vehicles, including carbon monoxide, hydrocarbons and oxides of nitrogen and amend the standards as necessary to protect public health and welfare.[47]

Pursuant to these statutory requirements, EPA has established emissions standards and testing procedures for light duty vehicles and heavy trucks.[48] To ensure compliance with these standards, EPA requires manufacturers to receive a certificate of conformity from EPA before a manufacturer can introduce vehicles into U.S. commerce.[49] To receive such a certificate, manufacturers must submit a detailed application to EPA for each test group of vehicles it intends to sell in the United States; the application must include a certification that the vehicles comply with emission standards as determined by specific testing procedures required by EPA, and a description of any air emission control devices contained within the vehicles.[50] The CAA provides for a fine of up to $37,500 for each car that does not conform to details within the certificate of compliance.[51]

In recognition of the fact that manufacturers may attempt to circumvent emission standards, the CAA prohibits any person from manufacturing, selling, offering to sell or installing any part in a motor vehicle that bypasses, defeats or renders inoperative any device or element of a vehicle's emission control technology.[52] EPA's implementing regulations specifically prohibit the use of "defeat devices," defined generally as an air emission control device "that reduces the effectiveness of the emission control system under conditions which may reasonably be expected to be encountered in normal vehicle operation and use…"[53] Under the CAA and EPA's regulations, manufacturers may be liable for up to $3,750 for each use of a defeat device.[54]

B. The Energy Policy and Conservation Act

Congress enacted the EPCA in 1975 following the energy crisis caused by the 1973 Mideast oil embargo.[55] In enacting EPCA, Congress observed that "[t]he fundamental reality is that this nation has entered a new era in which energy resources previously abundant, will remain in short supply retarding our economic growth and necessitating an alteration in our life's habitats and expectations."[56] Among the goals of EPCA are to "'decrease dependence on foreign imports, enhance national security [and to] achieve the efficient utilization of scarce resources...'"[57] The fundamental purpose of EPCA, however, is energy conservation.[58]

To comply with these goals, EPCA vests NHTSA with broad regulatory authority,[59] and requires NHTSA to set fuel economy standards at "the maximum feasible average fuel economy level that the Secretary decides the manufacturers can achieve in that model year."[60] In this way, EPCA is meant to encourage technological innovation — meaning new technologies, not simply better versions of what exists today. As the court in *Center for Auto Safety v. Thomas* noted, "[t]he experience of a decade leaves little doubt that the congressional scheme in fact induced manufacturers to achieve major technological breakthroughs as they advanced towards the mandated goal."[61] And as explained by the D.C. Circuit "when a statute is technology forcing, the agency can impose a standard which only the most technologically advanced plants in an industry have been able to achieve — even if only in some of their operations some of the time."[62]

In 2007, Congress passed the Energy Independence and Security Act of 2007 ("EISA"), which amended EPCA.[63] The EISA eliminated the previous 27.5 mpg standard for passenger cars with a mandate that NHTSA set separate passenger car and light truck standards for each model year beginning in 2011 "to achieve a combined fuel economy average for model year 2020 of at least 35 miles per gallon for the total fleet of passenger and non-passenger automobiles manufactured for sale in the United States for that model year."[64] Fuel economy standards for model years 2021 through 2030 must be the maximum feasible average fuel economy standard for each fleet of passenger and non-passenger cars for that model year.[65] These standards are known as the corporate average fuel economy ("CAFE") standards.

[65] *Id.* § 32902(b)(2)(B).

To help manufacturers comply with the CAFE standards, EPCA prescribes civil penalties that NHTSA can impose if their cars do not meet regulatory requirements. Specifically, a manufacturer is liable for a civil penalty of five dollars per automobile for each 0.1 mile per gallon shortfall.[66] The Act vests NHTSA with the authority to raise the total penalty up to ten dollars for each 0.1 mile per gallon shortfall, provided it first makes certain findings. NHTSA raised the penalty to $5.50 for each 0.1 mile per gallon shortfall in 1997, but has not raised it since, nor has the penalty been adjusted for inflation.[67]

III. The VW Scandal Reveals the Need to Issues Regulations to Amend Testing Procedures and Increase Penalties for Violations of Fuel Economy Standards

Volkswagen recently admitted that 11 million of its diesel cars sold worldwide since 2009, including nearly half a million sold in the United States, contain software specifically designed to cheat emissions tests. EPA has said that these devices allowed each car to spew up to *40 times* the legal limit of nitrogen oxides in the United States. Better testing procedures that more accurately reflect a vehicle's on-road emissions could prevent such egregious actions from occurring in the future.

This scandal raises yet another problem in the government's regulation of emissions from motor vehicles — that manufacturers regularly pay civil penalties rather than comply with NHTSA's CAFE standards. The penalties are therefore clearly inadequate to deter violations and inspire the technological innovation contemplated by EPCA, and reduce carbon dioxide emissions, and must be increased as a result.

A. EPA Must Promulgate Regulations to Require On-Road Emissions Testing, and Must Test Cars Sold in the United States Since 2009

The VW scandal demonstrates that EPA's current testing procedures for passenger cars and light trucks do not accurately reflect the actual emissions of these vehicles. EPA must promulgate regulations that require accurate, on-road testing sufficiently rigorous to detect defeat devices and thereby protect public health and welfare from the deleterious impacts of motor vehicle emissions.

As explained by EPA in its Notice of Violation to VW, "defeat devices" can detect when a car is being tested in a laboratory setting and adjusts engine operations to emit less-polluting exhaust during the test than in real-world driving conditions. Specifically, VW manufactured and installed software in the electronic control modules ("ECM") of vehicles equipped with 2.0 liter diesel engines.[68] The software could sense when the vehicle was being tested pursuant to EPA's dynamometer testing equipment.[69] When the software sensed testing, it produced compliant emission results under an ECM calibration, but at all other times the ECM ran a separate calibration that reduced the effectiveness of the emission control system, and the selective

[68] EPA, Notice of Violation to Volkswagen AG, Sept. 18, 2015.
[69] *Id.*

catalytic reduction, or the lean NOx trap, in particular.[70] EPA has determined that the software is an air emission control device that was not described in VW's certification applications and is an illegal defeat device, and that "VW violated section 203(a)(1) the CAA, 42 U.S.C. § 7522(a)(1), each time it sold, offered for sale, introduced into commerce, delivered for introduction into commerce, or imported…" one of the offending vehicles as a result.[71]

But this is not the first time a manufacturer has used these illegal, deceitful devices. Despite the express prohibitions on the use of defeat devices in the CAA and EPA's regulations, the use of such devices by a variety of manufacturers has been discovered on several occasions.[72] Indeed, such devices have been used beginning shortly after the enactment of the CAA, with early regulatory actions specifically intended to prevent their use.[73] And car and truck manufacturers have repeatedly been caught using such devices for almost as long as their use has been prohibited. For example, in 1973, EPA found that VW had installed temperature-sensitive devices that turned off emissions controls on tens of thousands of its vehicles.[74] And in 1998, the U.S. Department of Justice and EPA settled an enforcement case against the diesel engine industry for the widespread use of defeat devices in everything from tractor trailers to pick-up trucks. The settlement required seven companies, which comprised 95 percent of the U.S. heavy duty diesel engine market, to pay over one billion dollars, including $83.4 million in civil penalties, the largest ever imposed in environmental enforcement at that time.[75]

As suggested by EPA's letter to VW, a key reason vehicle manufacturers are able to use such devices to beat emissions tests are the inadequate testing procedures currently required by EPA. In particular, EPA's requirements for testing light-duty vehicles and trucks, known as the Federal Test Procedure ("FTP"), use a chassis dynamometer to test for various emissions, including nitrogen oxides, in a laboratory setting by simulating driving conditions. But given the artificial, predictable conditions in which the tests are run, software can sense when treadmill-like dynamometer equipment is being used based on the position of the steering wheel, vehicle speed and how long the engine operates, among other inputs.[76]

But alternative, on-road testing technologies exist. For example, on-road vehicle remote sensing is a type of technology that can scan the emissions of thousands of vehicles within a single day, and has previously been used to monitor real driving conditions by using optical sensors or a laboratory vehicle that follows cars and samples exhaust plumes.[77] And EPA already

---

[75] U.S. Dep't of Justice, Press Release: DOJ, EPA Announce One Billion Dollar Settlement With Diesel Engine Industry For Clean Air Act Violations, Oct. 22, 1998, *available at* http://www.justice.gov/archive/opa/pr/1998/October/499_enr.htm.
[76] Notice of Violation to Volkswagen.
[77] International Council on Clean Transportation, Guidance note about on-road vehicle emissions remote sensing, June 2013, *available at* http://www.theicct.org/sites/default/files/publications/RSD_Guidance_BorKlee.pdf.

requires on-road testing for heavy-duty diesel trucks.[78] Specifically, EPA has established a mandatory manufacturer-run, in-use emissions testing for heavy-duty diesel trucks using a portable emission measurement system ("PEMS").[79] PEMS typically involves equipping a test vehicle with a portable gas analyzer, and measuring emission rates during the driving. In announcing the regulatory change, EPA specifically noted that using such systems is "a significant step forward. . . in helping ensure that heavy-duty diesel engines comply with applicable emission standards" and that "these systems offer[] advantages over conventional approaches to assess in-use exhaust emissions from engines for design improvement, research, modeling, and compliance purposes."[80] Nevertheless, EPA has not implemented a similar requirement for passenger cars and light trucks.

The urgent need for such testing is now beyond dispute, and its benefits would not be limited to detecting the use of unlawful defeat devices alone. Even when cars do not contain defeat devices, the laboratory tests often fail to accurately reflect emissions as laboratory settings do not adequately incorporate road and weather conditions, use of accessories and aggressive driving. On-road tests reflect normal operation and use, and therefore a more accurate picture of emissions. And the benefits would not be limited to emissions of nitrogen oxides — the use of on-road emissions testing would also enable tests to more accurately reflect a vehicle's fuel efficiency and thus, its carbon dioxide emissions.

While current regulations vest EPA with the authority to conduct or require testing on any vehicle using driving cycles and conditions that may reasonably be expected to be encountered in normal operation and use (i.e., on-road conditions) for purposes of investigating the use of defeat devices,[81] the regulations do not go far enough as they do not mandate such inspections prior to putting new cars and light trucks on the road.[82] Mandating on-road inspections prior to the introduction of new light-duty motor vehicles is thus necessary to ensure cars comply with emission standards.

Accordingly, the Center hereby requests that EPA promulgate regulations to require on-road testing for all types of new diesel-powered motor vehicles not already subject to such testing requirements. The Center also requests that EPA promulgate regulations to require on-road testing for all other types of fossil fuel-powered motor vehicles. While VW's scandal involved diesel-powered cars, there is no indication that the use of such devices is limited to diesel vehicles. In fact, recent reports indicate that VW's gasoline-powered cars, as well as models from other manufacturers, consume significantly more fuel than measured in laboratory tests.

[81] 40 C.F.R. § 86.1809.

[82] *See e.g.*, International Council on Clean Transportation, In-use emission testing of light-duty diesel vehicles in the U.S., May 30, 2015, *available at* http://www.theicct.org/sites/default/files/publications/WVU_LDDV_in-use_ICCT_Report_Final_may2014.pdf (noting that there is no regulatory requirement in the United States to verify compliance of Tier 2 vehicles for emissions standards over off-cycle tests such as on road emissions testing).

Specifically, the Center requests that EPA adopt regulations in 40 C.F.R. part 86 and/or 1066 requiring on-road emissions testing as part of the certification process necessary to introduce any vehicle type into U.S commerce. These regulations could emulate those required for heavy-duty highway engines, adjusted as necessary to accommodate testing parameters needed for passenger cars and lighter trucks, and require state-of-the art on-road emission testing technology.[83]

The Center also requests that EPA conduct immediate in-use testing of each make and model of diesel-powered motor vehicles sold in the United States since 2009 that have not already undergone such tests, and each make and model of other fossil fuel-powered motor vehicles sold in the United States since 2009[84] to ensure that emissions comply with relevant standards, and any additional violators are held accountable.

B. NHTSA Must Promulgate Regulations to Increase the Penalties for Violations of CAFE Standards

NHTSA must increase the penalty for violations of CAFE standards. As explained above, EPCA vests NHTSA with the authority to impose a civil penalty of five dollars per automobile for each 0.1 mile per gallon a car falls short of the standards.[85] EPCA also vests NHTSA with the authority to increase the penalty for violations, provided it first makes certain findings. These findings include that increasing the penalty "will result in, or substantially further, substantial energy conservation for automobiles in model years in which the increased penalty may be imposed; . . . will not have a substantial deleterious impact on the economy of the United States, a State, or a region of a State" and will not cause significant unemployment, a significant increase in automobile imports or adversely affect competition.[86]

NHTSA exercised its statutory authority to increase the maximum civil penalty to $5.50 for each 0.1 mile per gallon shortfall in 1997. But NHTSA has not increased the penalty since, nor has it been adjusted for inflation. It is no surprise then that NHTSA has repeatedly acknowledged that many companies choose to regularly pay the fines rather than comply with the standards.[87] Indeed, the Government Accountability Office ("GAO") has reported that because the fines for violations of the CAFE standards have not increased, "CAFE penalties may not provide a strong enough incentive for manufacturers to comply with CAFE."[88] In this way, EPCA has not been implemented to its full potential, and continuing technological innovation and reductions in greenhouse emissions are thwarted. However, the GAO also found that "stricter penalties" for "noncompliance could improve compliance with CAFE standards."[89]

---

[83] *See* 40 C.F.R. part 1065 (emission testing requirements for heavy-duty highway vehicles).
[84] To the extent conducting these tests is not feasible, the Center alternatively requests that EPA conduct in-use testing of a significant portion of the top selling makes and models of motor vehicles in the United States.
[85] 49 U.S.C. § 32912(b).
[86] *Id.*
[87] GAO, Report to Congress, Vehicle Fuel Economy: NHTSA and EPA's Partnership for Setting Fuel Economy and Greenhouse Gas Emissions Standards Improved Analysis and Should Be Maintained, Feb. 2010, GAO-10-336, *available at* http://www.gao.gov/assets/310/301199 html.
[88] *Id.*
[89] *Id.*

Accordingly, the Center hereby requests that NHTSA promulgate regulations to increase the penalty for a violation of the CAFE standards. Specifically, the Center requests that NHTSA amend its regulation at 49 C.F.R. § 578.6(h)(2) to increase the penalty to the statutory maximum of $10 per 0.1 mile per gallon shortfall. The Center believes that NHTSA can easily make the requisite statutory findings in order to do so. Ensuring compliance with CAFE standards will promote competition by encouraging innovation and technological improvements, and will lead to economic benefits by reducing costly greenhouse gas emissions.[90] And the requested increase in the penalty is reasonable, as it is still below the statutory minimum adjusted for inflation. Specifically, the five dollar fine in 1975 adjusted for inflation would be roughly $22.15 today.[91]

IV. Conclusion

The transportation sector is the single largest source of air pollution and the second largest source of greenhouse gas emissions in the United States. While there are laws in place to attempt to reduce the impacts of these emissions by prescribing limits on the quantity of such emissions, the recent VW scandal reveals that car manufacturers often find ways to skirt such requirements. Improving testing procedures by requiring in-use testing of vehicles currently on the road, and on-road testing of all new motor vehicles in the future would help ensure emissions tests better reflect actual emissions, and thus provide a more accurate picture of whether car manufacturers are actually complying with emission standards. Similarly, increasing the penalties for a violation of the CAFE standards would incentivize compliance with fuel economy standards and reduce emissions of greenhouse gases from motor vehicles. All of these actions would promote the protection of public health, welfare and the environment by reducing dangerous emissions and reducing our dependency on dirty fossil fuels, as envisioned by the CAA and EPCA.

Sincerely,

/s/ Kristen Monsell

RE: Petition for Rulemaking to Implement New Emissions Testing for Motor Vehicles and Increase Penalties for Violations of Fuel Standards

Dear Administrator McCarthy and Administrator Rosekind,

The Center for Biological Diversity (the "Center") requests that you take immediate action to protect public health and the environment from the toxic impacts of greenhouse gas and nitrogen oxides emissions from motor vehicles, and from corporate practices designed to evade regulations restricting the quantity of these dangerous emissions. Specifically, pursuant to the Administrative Procedure Act, 5 U.S.C. § 553(e), Title II of the Clean Air Act ("CAA"), 42 U.S.C. §§ 7521-7554, and Title VI of the Energy Policy and Conservation Act ("EPCA"), 49 U.S.C. §§ 32901-32919, the Center requests that the U.S. Environmental Protection Agency ("EPA") and the National Highway Traffic Safety Administration ("NHTSA"):

(1) immediately conduct in-use emissions testing of each make and model of diesel-powered motor vehicles sold in the United States since 2009 that have not previously undergone such tests;

(2) immediately conduct in-use emissions testing of each make and model of other fossil fuel-powered motor vehicles sold in the United States since 2009 that have not previously undergone such tests;

(3) promulgate regulations to require on-road emissions testing for all types of new diesel-powered motor vehicles;

Alaska · Arizona · California · Florida · Minnesota · Nevada · New Mexico · New York · Oregon · Vermont · Washington, DC
Kristen Monsell, Staff Attorney, Oceans Program · 1212 Broadway, Suite 800 · Oakland, CA 94612
Phone: 510-844-7100 x 337 · Fax: 510-844-7150 · kmonsell@biologicaldiversity.org

(4) promulgate regulations to require on-road emissions testing for all other types of new fossil fuel-powered motor vehicles; and

(5) promulgate regulations to increase the penalties for violations of corporate average fuel economy standards.

As you are well-aware, Volkswagen recently admitted that 11 million of its diesel cars sold worldwide since 2009, including nearly half a million sold in the United States, contain software specifically designed to cheat emissions tests. The software — known as "defeat devices" — can detect when a car is being tested in a laboratory setting and adjusts engine operations to emit less-polluting exhaust during the test than in real-world driving conditions. EPA has said that these devices allowed each car to spew up to *40 times* the legal limit of nitrogen oxides emissions in the United States. Accordingly, in addition to the specific actions requested above, **the Center also requests that EPA assess the maximum permissible penalties against VW for such egregious violations of law.**

This widespread fraud not only deceived consumers who purchased VW cars based on the belief the cars were "clean diesel," but is a significant threat to public health and the environment. Emissions of nitrogen oxides contribute to climate change and ocean acidification — nitrogen oxides react with other substances to form the greenhouse gas ozone, and contain a highly potent and long-lived greenhouse gas. In addition, ground-level ozone can trigger or worsen asthma and other respiratory ailments, make the lungs more susceptible to infection, damage vegetation and reduce crop yields. Nitrogen oxides are also a precursor to particulate matter which causes breathing problems, lung tissue damage and premature death.

To make matters worse, the use of such devices, and thus unlawful emissions of such dangerous pollutants, may not be limited to VW. Indeed, defeat devices have existed almost since the inception of the CAA, and EPA has previously levied fines against car and truck manufacturers for the use of such devices. Recent reports indicate that tests of on-road emissions of cars made by other companies exceed that of laboratory testing, indicating that these manufactures might also be using defeat devices — or, at a minimum, are not performing as required. Despite the existence of technology that can measure emissions during normal operation and use, EPA does not require such tests for the vast majority of motor vehicles.

And the recent scandal highlights yet another industry-wide problem — that car manufacturers routinely pay fines, rather than comply with mandatory fuel economy standards that seek to improve fuel efficiency and reduce carbon dioxide emissions. As we have frequently pointed out, and as government reports indicate, the meager fines are too low to act as a deterrent, thereby failing to inspire the technological innovation contemplated by EPCA and the CAA. Yet NHTSA has not increased the penalty for violation of the standards in nearly two decades.

Comprehensive action is therefore needed to ensure long-term solutions to such pervasive problems. Taking the actions requested in this petition will improve the accuracy of emissions testing of motor vehicles and help ensure against future deception, and incentivize compliance with fuel economy standards intended to reduce greenhouse gas emissions and improve energy security. In other words, granting this petition will help better protect public health and the

environment from dangerous air pollutants from motor vehicles, while ensuring fuel economy continues to improve as intended by the CAA and EPCA.[1] The Center requests that EPA and NHTSA take the regulatory actions requested in this petition within 180 days.

I. Factual Background: Harmful Emissions from Motor Vehicles

As the VW scandal demonstrates, motor vehicles emit harmful air pollutants. In fact, according to the Union of Concerned Scientists, transportation is the largest single source of air pollution in the United States.[2] Motor vehicles emit carbon dioxide, oxides of nitrogen, particulate matter, hydrocarbons, carbon monoxide, sulfur dioxide, as well as benzene and other hazardous air pollutants.[3] These emissions contribute to a myriad of public health problems, negative impacts to public welfare and the environment, and climate change.

A. Emissions from Motor Vehicles Are Harmful to Public Health

Motor vehicles emit air pollutants that cause or contribute to health problems, including nitrogen oxides. For example, ground level ozone is created by chemical reaction between nitrogen oxides and volatile organic compounds. Ground-level ozone pollution is linked to many public health impacts, especially those related to respiratory function. Ozone can irritate the respiratory tract and throat, impair lung function, and cause coughing, chest pains and lung inflammation.[4] EPA has recognized the association between ozone exposure and hospital visits for respiratory problems — especially for children — noting that ozone pollution is responsible for as much as twenty percent of all summertime respiratory hospital visits.[5] Ozone is also linked to the development of respiratory diseases, such as asthma.[6] But the health effects of ozone are not limited to respiratory illnesses. Ozone pollution is linked to other serious health impacts, such as heart disease and certain types of strokes.[7] "[M]ost importantly," according to the American Lung Association, ozone exposure and the associated health impacts can shorten lives

VW FOIA, EPA 06/20/2017 2017-FFP_028332

by months and even years.[8] "Even at very low levels including days that meet current regulatory requirements," ozone is associated with premature mortality.[9]

Ozone also has detrimental ecological effects. According to EPA, ozone "affects sensitive vegetation and ecosystems, including forests, parks, wildlife refuges, and wilderness areas," especially during growing seasons.[10] Ozone can interfere with a plant's ability to produce and store food, visibly damage leaves, and make plants susceptible to damage from disease, insects, competition and severe weather.[11]

Nitrogen oxides also mix with other air pollutants to create particulate matter ("PM"). The effects associated with PM exposure are "premature mortality, increased hospital admissions and emergency department visits, and development of chronic respiratory disease."[12] California has identified diesel PM as a toxic air contaminant and has estimated that 70 percent of the cancer risk from the air Californians breathe is attributable to diesel PM; EPA says that diesel PM is "likely to be a carcinogen."[13] Diesel exhaust is a major contributor to PM pollution. In fact, it is estimated that diesel-powered vehicles and equipment account for nearly half of all nitrogen oxides and more than two-thirds of all PM emissions from U.S. transportation sources.[14]

B. Emissions from Motor Vehicles Contribute to Climate Change

The burning of fossil fuels is the largest source of domestic greenhouse gas emissions, accounting for 77 percent of total warming emissions in 2013.[15] One of the primary sources of such emissions is from the transportation sector, which in 2013 accounted for 27 percent of all greenhouse gas emissions in the United States.[16] The largest source of such emissions from the transportation sector is passenger cars, representing nearly 43 percent of emissions in 2013.[17]

[17] *Id.*

The transportation sector has been the fastest-growing source of greenhouse gas emissions since 1990.[18]

Carbon dioxide is the dominant greenhouse gas driving observed changes in the Earth's climate.[19] Emissions of nitrogen oxides also contribute to climate change through two primary means: (1) nitrogen oxides react with other substances to form the greenhouse gas ozone; and (2) nitrous oxide is itself a highly potent and long-lived greenhouse gas. Nitrous oxide behaves very similarly to carbon dioxide in that it both directly traps heat in the atmosphere and remains in existence for many decades once emitted.[20]

There is a strong, international scientific consensus that anthropogenic climate threatens human society and natural systems. The U.S. Global Change Research Program in its 2009 report *Climate Change Impacts in the United States* similarly stated that "global warming is unequivocal and primarily human-induced" and "widespread climate-related impacts are occurring now and are expected to increase."[21] The U.S. National Research Council similarly concluded that "[c]limate change is occurring, is caused largely by human activities, and poses significant risks for — and in many cases is already affecting — a broad range of human and natural systems."[22] Based on observed and expected harms from climate change, in 2009 EPA concluded that greenhouse gas pollution endangers the health and welfare of current and future generations.[23] Current atmospheric concentrations of greenhouse gases are already resulting in significant climate change impacts that are projected to worsen as emissions rise.[24]

Key changes include warming temperatures, the increasing frequency of extreme weather events, rapidly melting glaciers, ice sheets, and sea ice and rising sea levels.[25] There will be significant costs associated with these changes. For example, in the United States in 2011 alone, a record 14 weather and climate disasters occurred, including droughts, heat waves, and floods, that cost at least $1 billion each in damages and loss of human lives.[26] In addition, air pollution components that trigger asthma attacks, specifically air particulates and ozone, are expected to increase with climate change;[27] in 2020, the continental United States could pay an average of

$5.4 billion (2008$) in health impact costs associated with the climate penalty on ozone, with California experiencing the greatest estimated impacts averaged at $729 million.[28]

Anthropogenic climate change also poses a significant threat to biodiversity. Climate change is already causing changes in distribution, phenology, physiology, genetics, species interactions, ecosystem services, demographic rates and population viability: many animals and plants are moving poleward and upward in elevation, shifting their timing of breeding and migration, and experiencing population declines and extirpations.[29] Because climate change is occurring at an unprecedented pace with multiple synergistic impacts, climate change is predicted to result in catastrophic species losses during this century.

The Intergovernmental Panel on Climate Change ("IPCC") concluded that 20 to 30 percent of plant and animal species will face an increased risk of extinction if global average temperature rise exceeds 1.5°C to 2.5°C relative to 1980-1999, with an increased risk of extinction for up to 70 percent of species worldwide if global average temperature exceeds 3.5°C relative to 1980-1999.[30] Other studies have predicted similarly severe losses: 15 to 37 percent of the world's plants and animals committed to extinction by 2050 under a mid-level emissions scenario;[31] the potential extinction of 10 to 14 percent of species by 2100 if climate change continues unabated;[32] and the loss of more than half of the present climatic range for 58 percent of plants and 35 percent of animals by the 2080s under the current emissions pathway, in a sample of 48,786 species.[33] Scientists have warned that the Earth is fast approaching a global "state-shift" that could result in unanticipated and rapid changes to Earth's biological systems.[34] As summarized by the 2014 National Climate Assessment, "landscapes and seascapes are changing rapidly, and species, including many iconic species, may disappear from regions where they have been prevalent or become extinct, altering some regions so much that their mix of plant and animal life will become almost unrecognizable."[35]

In addition, the ocean's absorption of anthropogenic greenhouse gas emissions, including both carbon dioxide and nitrogen oxides, has already resulted in more than a 30 percent increase

VW FOIA, EPA 06/20/2017 2017-FFP_028335

in the acidity of ocean surface waters, at a rate faster than anything believed to have occurred in the past 300 million years.[36] Ocean acidity is projected to increase by 150 to 200 percent by the end of the century if carbon dioxide emissions continue unabated.[37] Ocean acidification negatively affects a wide range of marine species by hindering the ability of calcifying marine creatures to build protective shells and skeletons and by disrupting metabolism and critical biological functions.[38] The adverse effects of ocean acidification are already being observed in wild populations, including reduced coral calcification rates,[39] dissolution of pteropod shells in the California Current,[40] reduced shell weights of foraminifera in the Southern Ocean,[41] and mass die-offs of larval Pacific oysters in the Pacific Northwest.[42]

II. Legal Background: The Regulation of Emissions from Motor Vehicles

Given the negative impacts on public health and the environment caused by the emission of air pollutants from various sources, including the transportation sector, Congress has enacted several laws to regulate and limit the amount of air pollutants from motor vehicles.

A. The Clean Air Act

In enacting the CAA, Congress found that "that the growth in the amount and complexity of air pollution brought about by urbanization, industrial development, *and the increasing use of*

motor vehicles, has resulted in mounting dangers to the public health and welfare, including injury to agricultural crops and livestock..."[43] Accordingly, the CAA establishes a comprehensive scheme "to protect and enhance the quality of the Nation's air resources so as to promote the public health and welfare and the productive capacity of its population."[44]

To reach these goals, Title II of the CAA prescribes a regulatory scheme to control emissions from mobile sources.[45] Specifically, the CAA requires EPA to promulgate regulations that establish standards for the emissions of air pollutants from new motor vehicles that "cause, or contribute to, air pollution which may reasonably be anticipated to endanger public health or welfare" and prohibits exceedances of those standards.[46] The CAA mandates that EPA set emission standards for particular pollutants from light and heavy duty vehicles, including carbon monoxide, hydrocarbons and oxides of nitrogen and amend the standards as necessary to protect public health and welfare.[47]

Pursuant to these statutory requirements, EPA has established emissions standards and testing procedures for light duty vehicles and heavy trucks.[48] To ensure compliance with these standards, EPA requires manufacturers to receive a certificate of conformity from EPA before a manufacturer can introduce vehicles into U.S. commerce.[49] To receive such a certificate, manufacturers must submit a detailed application to EPA for each test group of vehicles it intends to sell in the United States; the application must include a certification that the vehicles comply with emission standards as determined by specific testing procedures required by EPA, and a description of any air emission control devices contained within the vehicles.[50] The CAA provides for a fine of up to $37,500 for each car that does not conform to details within the certificate of compliance.[51]

In recognition of the fact that manufacturers may attempt to circumvent emission standards, the CAA prohibits any person from manufacturing, selling, offering to sell or installing any part in a motor vehicle that bypasses, defeats or renders inoperative any device or element of a vehicle's emission control technology.[52] EPA's implementing regulations specifically prohibit the use of "defeat devices," defined generally as an air emission control device "that reduces the effectiveness of the emission control system under conditions which may reasonably be expected to be encountered in normal vehicle operation and use…"[53] Under the CAA and EPA's regulations, manufacturers may be liable for up to $3,750 for each use of a defeat device.[54]

B. The Energy Policy and Conservation Act

Congress enacted the EPCA in 1975 following the energy crisis caused by the 1973 Mideast oil embargo.[55] In enacting EPCA, Congress observed that "[t]he fundamental reality is that this nation has entered a new era in which energy resources previously abundant, will remain in short supply retarding our economic growth and necessitating an alteration in our life's habitats and expectations."[56] Among the goals of EPCA are to "'decrease dependence on foreign imports, enhance national security [and to] achieve the efficient utilization of scarce resources...'"[57] The fundamental purpose of EPCA, however, is energy conservation.[58]

To comply with these goals, EPCA vests NHTSA with broad regulatory authority,[59] and requires NHTSA to set fuel economy standards at "the maximum feasible average fuel economy level that the Secretary decides the manufacturers can achieve in that model year."[60] In this way, EPCA is meant to encourage technological innovation — meaning new technologies, not simply better versions of what exists today. As the court in *Center for Auto Safety v. Thomas* noted, "[t]he experience of a decade leaves little doubt that the congressional scheme in fact induced manufacturers to achieve major technological breakthroughs as they advanced towards the mandated goal."[61] And as explained by the D.C. Circuit "when a statute is technology forcing, the agency can impose a standard which only the most technologically advanced plants in an industry have been able to achieve — even if only in some of their operations some of the time."[62]

In 2007, Congress passed the Energy Independence and Security Act of 2007 ("EISA"), which amended EPCA.[63] The EISA eliminated the previous 27.5 mpg standard for passenger cars with a mandate that NHTSA set separate passenger car and light truck standards for each model year beginning in 2011 "to achieve a combined fuel economy average for model year 2020 of at least 35 miles per gallon for the total fleet of passenger and non-passenger automobiles manufactured for sale in the United States for that model year."[64] Fuel economy standards for model years 2021 through 2030 must be the maximum feasible average fuel economy standard for each fleet of passenger and non-passenger cars for that model year.[65] These standards are known as the corporate average fuel economy ("CAFE") standards.

To help manufacturers comply with the CAFE standards, EPCA prescribes civil penalties that NHTSA can impose if their cars do not meet regulatory requirements. Specifically, a manufacturer is liable for a civil penalty of five dollars per automobile for each 0.1 mile per gallon shortfall.[66] The Act vests NHTSA with the authority to raise the total penalty up to ten dollars for each 0.1 mile per gallon shortfall, provided it first makes certain findings. NHTSA raised the penalty to $5.50 for each 0.1 mile per gallon shortfall in 1997, but has not raised it since, nor has the penalty been adjusted for inflation.[67]

III. The VW Scandal Reveals the Need to Issues Regulations to Amend Testing Procedures and Increase Penalties for Violations of Fuel Economy Standards

Volkswagen recently admitted that 11 million of its diesel cars sold worldwide since 2009, including nearly half a million sold in the United States, contain software specifically designed to cheat emissions tests. EPA has said that these devices allowed each car to spew up to *40 times* the legal limit of nitrogen oxides in the United States. Better testing procedures that more accurately reflect a vehicle's on-road emissions could prevent such egregious actions from occurring in the future.

This scandal raises yet another problem in the government's regulation of emissions from motor vehicles — that manufacturers regularly pay civil penalties rather than comply with NHTSA's CAFE standards. The penalties are therefore clearly inadequate to deter violations and inspire the technological innovation contemplated by EPCA, and reduce carbon dioxide emissions, and must be increased as a result.

A. EPA Must Promulgate Regulations to Require On-Road Emissions Testing, and Must Test Cars Sold in the United States Since 2009

The VW scandal demonstrates that EPA's current testing procedures for passenger cars and light trucks do not accurately reflect the actual emissions of these vehicles. EPA must promulgate regulations that require accurate, on-road testing sufficiently rigorous to detect defeat devices and thereby protect public health and welfare from the deleterious impacts of motor vehicle emissions.

As explained by EPA in its Notice of Violation to VW, "defeat devices" can detect when a car is being tested in a laboratory setting and adjusts engine operations to emit less-polluting exhaust during the test than in real-world driving conditions. Specifically, VW manufactured and installed software in the electronic control modules ("ECM") of vehicles equipped with 2.0 liter diesel engines.[68] The software could sense when the vehicle was being tested pursuant to EPA's dynamometer testing equipment.[69] When the software sensed testing, it produced compliant emission results under an ECM calibration, but at all other times the ECM ran a separate calibration that reduced the effectiveness of the emission control system, and the selective

[69] *Id.*

VW FOIA, EPA 06/20/2017 2017-FFP_028339

catalytic reduction, or the lean NOx trap, in particular.[70] EPA has determined that the software is an air emission control device that was not described in VW's certification applications and is an illegal defeat device, and that "VW violated section 203(a)(1) the CAA, 42 U.S.C. § 7522(a)(1), each time it sold, offered for sale, introduced into commerce, delivered for introduction into commerce, or imported…" one of the offending vehicles as a result.[71]

But this is not the first time a manufacturer has used these illegal, deceitful devices. Despite the express prohibitions on the use of defeat devices in the CAA and EPA's regulations, the use of such devices by a variety of manufacturers has been discovered on several occasions.[72] Indeed, such devices have been used beginning shortly after the enactment of the CAA, with early regulatory actions specifically intended to prevent their use.[73] And car and truck manufacturers have repeatedly been caught using such devices for almost as long as their use has been prohibited. For example, in 1973, EPA found that VW had installed temperature-sensitive devices that turned off emissions controls on tens of thousands of its vehicles.[74] And in 1998, the U.S. Department of Justice and EPA settled an enforcement case against the diesel engine industry for the widespread use of defeat devices in everything from tractor trailers to pick-up trucks. The settlement required seven companies, which comprised 95 percent of the U.S. heavy duty diesel engine market, to pay over one billion dollars, including $83.4 million in civil penalties, the largest ever imposed in environmental enforcement at that time.[75]

As suggested by EPA's letter to VW, a key reason vehicle manufacturers are able to use such devices to beat emissions tests are the inadequate testing procedures currently required by EPA. In particular, EPA's requirements for testing light-duty vehicles and trucks, known as the Federal Test Procedure ("FTP"), use a chassis dynamometer to test for various emissions, including nitrogen oxides, in a laboratory setting by simulating driving conditions. But given the artificial, predictable conditions in which the tests are run, software can sense when treadmill-like dynamometer equipment is being used based on the position of the steering wheel, vehicle speed and how long the engine operates, among other inputs.[76]

But alternative, on-road testing technologies exist. For example, on-road vehicle remote sensing is a type of technology that can scan the emissions of thousands of vehicles within a single day, and has previously been used to monitor real driving conditions by using optical sensors or a laboratory vehicle that follows cars and samples exhaust plumes.[77] And EPA already

---

[75] U.S. Dep't of Justice, Press Release: DOJ, EPA Announce One Billion Dollar Settlement With Diesel Engine Industry For Clean Air Act Violations, Oct. 22, 1998, *available at* http://www.justice.gov/archive/opa/pr/1998/October/499_enr.htm.
[76] Notice of Violation to Volkswagen.
[77] International Council on Clean Transportation, Guidance note about on-road vehicle emissions remote sensing, June 2013, *available at* http://www.theicct.org/sites/default/files/publications/RSD_Guidance_BorKlee.pdf.

requires on-road testing for heavy-duty diesel trucks.[78] Specifically, EPA has established a mandatory manufacturer-run, in-use emissions testing for heavy-duty diesel trucks using a portable emission measurement system ("PEMS").[79] PEMS typically involves equipping a test vehicle with a portable gas analyzer, and measuring emission rates during the driving. In announcing the regulatory change, EPA specifically noted that using such systems is "a significant step forward. . . in helping ensure that heavy-duty diesel engines comply with applicable emission standards" and that "these systems offer[] advantages over conventional approaches to assess in-use exhaust emissions from engines for design improvement, research, modeling, and compliance purposes."[80] Nevertheless, EPA has not implemented a similar requirement for passenger cars and light trucks.

The urgent need for such testing is now beyond dispute, and its benefits would not be limited to detecting the use of unlawful defeat devices alone. Even when cars do not contain defeat devices, the laboratory tests often fail to accurately reflect emissions as laboratory settings do not adequately incorporate road and weather conditions, use of accessories and aggressive driving. On-road tests reflect normal operation and use, and therefore a more accurate picture of emissions. And the benefits would not be limited to emissions of nitrogen oxides — the use of on-road emissions testing would also enable tests to more accurately reflect a vehicle's fuel efficiency and thus, its carbon dioxide emissions.

While current regulations vest EPA with the authority to conduct or require testing on any vehicle using driving cycles and conditions that may reasonably be expected to be encountered in normal operation and use (i.e., on-road conditions) for purposes of investigating the use of defeat devices,[81] the regulations do not go far enough as they do not mandate such inspections prior to putting new cars and light trucks on the road.[82] Mandating on-road inspections prior to the introduction of new light-duty motor vehicles is thus necessary to ensure cars comply with emission standards.

Accordingly, the Center hereby requests that EPA promulgate regulations to require on-road testing for all types of new diesel-powered motor vehicles not already subject to such testing requirements. The Center also requests that EPA promulgate regulations to require on-road testing for all other types of fossil fuel-powered motor vehicles. While VW's scandal involved diesel-powered cars, there is no indication that the use of such devices is limited to diesel vehicles. In fact, recent reports indicate that VW's gasoline-powered cars, as well as models from other manufacturers, consume significantly more fuel than measured in laboratory tests.

[79] *Id.*

[80] *Id.*

[81] 40 C.F.R. § 86.1809.

[82] *See e.g.*, International Council on Clean Transportation, In-use emission testing of light-duty diesel vehicles in the U.S., May 30, 2015, *available at* http://www.theicct.org/sites/default/files/publications/WVU_LDDV_in-use_ICCT_Report_Final_may2014.pdf (noting that there is no regulatory requirement in the United States to verify compliance of Tier 2 vehicles for emissions standards over off-cycle tests such as on road emissions testing).

Specifically, the Center requests that EPA adopt regulations in 40 C.F.R. part 86 and/or 1066 requiring on-road emissions testing as part of the certification process necessary to introduce any vehicle type into U.S commerce. These regulations could emulate those required for heavy-duty highway engines, adjusted as necessary to accommodate testing parameters needed for passenger cars and lighter trucks, and require state-of-the art on-road emission testing technology.[83]

The Center also requests that EPA conduct immediate in-use testing of each make and model of diesel-powered motor vehicles sold in the United States since 2009 that have not already undergone such tests, and each make and model of other fossil fuel-powered motor vehicles sold in the United States since 2009[84] to ensure that emissions comply with relevant standards, and any additional violators are held accountable.

B. NHTSA Must Promulgate Regulations to Increase the Penalties for Violations of CAFE Standards

NHTSA must increase the penalty for violations of CAFE standards. As explained above, EPCA vests NHTSA with the authority to impose a civil penalty of five dollars per automobile for each 0.1 mile per gallon a car falls short of the standards.[85] EPCA also vests NHTSA with the authority to increase the penalty for violations, provided it first makes certain findings. These findings include that increasing the penalty "will result in, or substantially further, substantial energy conservation for automobiles in model years in which the increased penalty may be imposed; . . . will not have a substantial deleterious impact on the economy of the United States, a State, or a region of a State" and will not cause significant unemployment, a significant increase in automobile imports or adversely affect competition.[86]

NHTSA exercised its statutory authority to increase the maximum civil penalty to $5.50 for each 0.1 mile per gallon shortfall in 1997. But NHTSA has not increased the penalty since, nor has it been adjusted for inflation. It is no surprise then that NHTSA has repeatedly acknowledged that many companies choose to regularly pay the fines rather than comply with the standards.[87] Indeed, the Government Accountability Office ("GAO") has reported that because the fines for violations of the CAFE standards have not increased, "CAFE penalties may not provide a strong enough incentive for manufacturers to comply with CAFE."[88] In this way, EPCA has not been implemented to its full potential, and continuing technological innovation and reductions in greenhouse emissions are thwarted. However, the GAO also found that "stricter penalties" for "noncompliance could improve compliance with CAFE standards."[89]

---

[83] *See* 40 C.F.R. part 1065 (emission testing requirements for heavy-duty highway vehicles).
[84] To the extent conducting these tests is not feasible, the Center alternatively requests that EPA conduct in-use testing of a significant portion of the top selling makes and models of motor vehicles in the United States.
[85] 49 U.S.C. § 32912(b).
[86] *Id.*
[87] GAO, Report to Congress, Vehicle Fuel Economy: NHTSA and EPA's Partnership for Setting Fuel Economy and Greenhouse Gas Emissions Standards Improved Analysis and Should Be Maintained, Feb. 2010, GAO-10-336, *available at* http://www.gao.gov/assets/310/301199 html.
[88] *Id.*
[89] *Id.*

Accordingly, the Center hereby requests that NHTSA promulgate regulations to increase the penalty for a violation of the CAFE standards. Specifically, the Center requests that NHTSA amend its regulation at 49 C.F.R. § 578.6(h)(2) to increase the penalty to the statutory maximum of $10 per 0.1 mile per gallon shortfall. The Center believes that NHTSA can easily make the requisite statutory findings in order to do so. Ensuring compliance with CAFE standards will promote competition by encouraging innovation and technological improvements, and will lead to economic benefits by reducing costly greenhouse gas emissions.[90] And the requested increase in the penalty is reasonable, as it is still below the statutory minimum adjusted for inflation. Specifically, the five dollar fine in 1975 adjusted for inflation would be roughly $22.15 today.[91]

IV. Conclusion

The transportation sector is the single largest source of air pollution and the second largest source of greenhouse gas emissions in the United States. While there are laws in place to attempt to reduce the impacts of these emissions by prescribing limits on the quantity of such emissions, the recent VW scandal reveals that car manufacturers often find ways to skirt such requirements. Improving testing procedures by requiring in-use testing of vehicles currently on the road, and on-road testing of all new motor vehicles in the future would help ensure emissions tests better reflect actual emissions, and thus provide a more accurate picture of whether car manufacturers are actually complying with emission standards. Similarly, increasing the penalties for a violation of the CAFE standards would incentivize compliance with fuel economy standards and reduce emissions of greenhouse gases from motor vehicles. All of these actions would promote the protection of public health, welfare and the environment by reducing dangerous emissions and reducing our dependency on dirty fossil fuels, as envisioned by the CAA and EPCA.

Sincerely,

/s/ Kristen Monsell

WATER POLLUTION:

EPA finalizes long-awaited power plant discharge rule

Katherine Ling, E&E reporter

Published: Wednesday, September 30, 2015

U.S. EPA today gave owners of coal-fired power plants a bit of breathing room under long-awaited final standards that raise the bar for cutting toxic metal discharge.

The final rule announced today updates for the first time in 30 years federal limits on toxic metals in power plant discharge wastewater but allows industry more time to coordinate how it will comply with these new standards and a rule governing coal ash released at the end of last year, EPA said.

The original 1982 rule focused on solid particulates rather than dissolved pollutants like mercury, lead, selenium and other heavy metals, many of which do not break down for years.

The new rule is "strong but achievable" and "provides flexibility" by creating a phased-in approach to the new requirements between 2018 and 2023, Ken Kopocis, EPA's deputy assistant administrator for water, said today during a call with reporters about the new rule.

It will "allow industry to make rational decisions" about where to make investments related to fuel changes or how to handle waste, Kopocis said.

Steam electric power plants are responsible for more than half of all toxic pollutants poured into surface waters by all industrial categories regulated by the Clean Water Act, or about 5.5 billion pounds of wastewater, according to EPA.

The agency estimates the new rule will cut 1.4 billion pounds of toxic pollutant discharge from electric power plants at a price tag of $480 million per year. It will also reduce water withdrawal by power plants by 57 billion gallons per year, providing an estimated annual benefit of $463 million.

A proposed rule issued in 2013 would have cut up to 2.6 billion pounds of pollutants, but compliance costs for industry could have skyrocketed to $954 million per year.

The final rule borrows heavily from what was described at "option 4" under the proposed rule, controversially including the need for plants producing more than 50 megawatts of power to put fly ash and "bottom ash" -- waste left at the bottom of the boiler -- in landfills, known as dry handling, and providing additional compliance time if owners put in more advanced technology (*Greenwire*, Sept. 29).

"This is a major step forward for protecting the health of American families, especially our kids," Kopocis said.

It is "based on readily available technology that many in the industry already use today while producing affordable power," Kopocis said, noting that 134 plants of 1,080 current plants would incur costs to meet the new requirements, and the requirements would add "pennies" to monthly household power bills.

Environmental groups welcomed the new rule.

"We don't drive cars or fly airplanes based on 1982 safety standards, so why should we allow power plants to dump poisons into our waters under such outdated standards?" Earthjustice attorney Thomas Cmar said in a statement. "Today's rule finally ends the decades-old industry practice of using massive amounts of water to move toxic waste out of power plants and into unlined impoundments, which ultimately goes into our rivers, lakes and streams. This rule is a big step forward, and we stand prepared to help defend against any industry attempts to weaken it."

Dalal Aboulhosn of the Sierra Club said the rule is "a major step in making sure our waterways are not only safe to swim and boat in, but also safe to fish from and use as drinking water."

A 2013 report from a coalition of green groups found that 70 percent of coal-fired power plants' permits had no discharge limits for toxins that are linked with neurological damage, cancer and fish die-offs. More than a quarter of the plants the groups looked at were releasing such metals into waterways that were already declared impaired (*E&ENews PM*, July 23, 2013).

NUCLEAR WASTE:

House Ag chairman's bill could draw big cash to district

Hannah Northey, E&E reporter

Published: Wednesday, September 30, 2015

The Republican chairman of the House Agriculture Committee unveiled legislation late last night that could bring hundreds of millions of dollars to a controversial nuclear waste storage company in his West Texas district.

Rep. Michael Conaway's bill, the "Interim Consolidated Storage Act of 2015," would authorize the Energy secretary to move forward with temporary sites to store nuclear waste with interest generated from the Nuclear Waste Fund.

The NWF is a pot of money exceeding $30 billion that consists of fees from nuclear customers and was intended to be used to build the controversial and now-stalled Yucca Mountain nuclear waste repository in Nevada.

Conaway's measure would amend the Nuclear Waste Policy Act of 1982 to authorize the secretary to enter into contracts for the storage of certain high-level radioactive waste and spent nuclear fuel, take title to the material, and use interest from the Nuclear Waste Fund to move forward with interim storage sites.

Co-sponsors of the bill include a host of Texas Republicans: Reps. Sam Johnson, Randy Neugebauer, Blake Farenthold, Kay Granger, Kenny Marchant, John Culberson, Lamar Smith and John Carter, as well as Rep. Darrell Issa (R-Calif.). Democrats backing the language are Reps. Joe Courtney of Connecticut, Doris Matsui of California, Chellie Pingree of Maine and Gene Green of Texas.

The language could benefit Waste Control Specialists, a Texas company whose former owner, billionaire Harold Simmons, once dubbed President Obama the most "dangerous man in America." Dallas-based WCS has been working with Conaway's office on the legislation and last night applauded the bill's introduction.

"This is another significant step in a process to provide a mechanism that will give the U.S. Department of Energy the necessary ability to enter into contracts with private companies with the ability to provide interim storage of spent nuclear fuel," WCS spokesman Chuck McDonald said in an email. "This is an important development in the efforts to establish an interim solution to a national issue -- material currently stranded at nuclear facilities across the country."

WCS has said in the past that the bill will not affect funding for Yucca Mountain because it would only use interest from the Nuclear Waste Fund. WCS is planning to ask the Nuclear Regulatory Commission next year for a license to build an interim storage site in Andrews County, about 350 miles west of Dallas. The site is within Texas' 11th District, which Conaway represents.

WCS is at the forefront of a small group of project developers hoping to temporarily store nuclear waste for the Energy Department, thereby securing the federal government as a top customer. DOE has expressed interest in moving forward with interim storage as a way to stave off costly lawsuits the agency faces for failing to uphold 1980s agreements to take possession of waste piling up at reactors across the country.

Damages could be more than $20 billion by 2020 and up to $500 million annually after 2020, according to the Nuclear Energy Institute.

Also interested in hosting an interim site is the Austin energy company AFCI Texas LLC, which has

proposed to build a facility in Culberson County in West Texas. Holtec International Inc. has also said it intends to move forward with an underground storage facility in southeastern New Mexico, where the government could store casks of used fuel (*E&E Daily*, April 30).

Still, WCS appears to be in the lead, as New Mexico's Democratic senators have voiced opposition to the project in the Land of Enchantment, and residents living near the site of AFCI Texas' proposed project have voiced concerns about it.

Rep. John Shimkus (R-Ill.), the leading House advocate for opening Yucca, has said Conaway's legislation can be part of the answer, just as long as Yucca Mountain remains on the table and is linked to interim storage sites.

Issa, a co-sponsor of the bill, released legislation yesterday that would link up communities housing unwanted nuclear waste with regions of the country willing to host a storage facility.

Issa also made clear his bill wouldn't change the fate of Yucca but would ensure that waste sitting at shuttered reactors -- like the San Onofre units in his district -- is stored someplace safe (*E&E Daily*, Sept. 30).

Issa's bill would rely on interest the Nuclear Waste Fund generates, not the fund itself.

ENERGY POLICY:

GOP defeats host of Dem proposals to sweeping House package

Hannah Northey, E&E reporter

Published: Wednesday, September 30, 2015

Republicans on the House Energy and Commerce Committee today defeated a slew of Democratic proposals for revising a comprehensive energy package as bipartisan relations continued to fizzle along with the bill's chances.

Energy and Commerce Chairman Fred Upton (R-Mich.) repeatedly said he was hopeful the package would make it to President Obama's desk despite opposition from top Democrats on the committee.

"If it somehow gets stalled, I will come back to it," Upton said. "Let's just try and get this done."

But Energy and Commerce ranking member Frank Pallone (D-N.J.) shot back, saying the bill is not headed to the president's desk. He expressed concern again with a manager's amendment Upton unveiled yesterday to H.R. 8, the "North American Energy Security and Infrastructure Act of 2015," with a host of changes addressing exports of domestic gas, the nation's power markets and grid reliability (*Greenwire*, Sept. 29).

"What the committee is doing with the substitute today is going in the direct opposite direction if you're looking to get the president to sign the bill," Pallone said.

Bipartisan efforts to move the bill forward appeared to wane weeks ago after the committee delayed a markup of the bill, with top Republicans outlining sticking points. Those divisions were on full display today as Pallone and other Democrats opposed proposals from their Republican colleagues.

At publication time, the panel was still debating the more than 40 amendments filed to the bill, the majority

of which are sponsored by Democrats.

Grid reliability

The committee today voted 27-22 to defeat language Pallone proposed to scrap a provision in the bill that would require the Federal Energy Regulatory Commission and the country's grid operators to analyze the effects of complying with any proposed or final federal rule costing more than $1 billion and affecting generating units.

Those rules would include environmental rules such as the Clean Power Plan, which has become a target for Republicans. Under the bill, FERC and system operators would need to complete an independent review of how a rule would affect reliability, the nation's energy mix, wholesale markets, and infrastructure like transmission and gas pipelines.

Pallone argued that U.S. EPA's rules had not caused reliability issues and shouldn't be the target of the energy bill.

But Energy and Power Subcommittee Chairman Ed Whitfield (R-Ky.), who yesterday announced plans to retire at the end of the 114th Congress, argued the language was critical to securing the country's energy supplies. Whitfield said the section was one of four that caused bipartisan collaboration on the bill to fail.

EPA, he added, has been active in an unprecedented way because of Obama's climate goals, and the final bill should look at reliability.

"FERC has come up here and testified on these regulations -- from EPA and other agencies -- and said EPA particularly doesn't talk to them about the impact on reliability of these rules," Whitfield said.

Capacity markets

Republicans defeated 26-22 an amendment Democratic Rep. Joe Kennedy of Massachusetts introduced to scrap language in the bill that would require FERC to study whether the country's capacity markets are ensuring that sufficient generation is built.

Kennedy argued that language in the manager's amendment requiring the FERC study would do much more, possibly entering new data into the filing process at FERC and requiring grid operators to make changes before such markets are fully understood. Capacity prices in New England, Kennedy said, have surged from $1 billion to $4 billion in recent years without significant new construction. He said the language requiring the study was too vague and could do more harm than good.

Rep. Peter Welch (D-Vt.) supported Kennedy's amendment and called for additional oversight hearings on capacity markets, noting that the American Public Power Association opposed the original language and agreed the FERC "study" could force grid operators to make changes based on what they find. Welch also said the language was skewed toward fuels that Republicans favor.

"The definition is clearly skewed to favor coal and nuclear resources," he said.

House Republicans, on the other hand, argued that they had significantly watered down the language to appease Democrats and that it was critical to touch on reliability in the final energy bill.

The committee also defeated 27-22 an amendment from Rep. Paul Tonko (D-N.Y.) that would have added an impact analysis to the original study the bill calls for, which he said would allow grid operators to comment on any problems with adopting the energy bill's definition of reliability.

Rep. Mike Doyle (D-Pa.), who voted against Tonko's amendment, said the committee should have had more time and warned the issue is critical because nuclear reactors competing with cheap natural gas are retiring. That, in turn, could degrade his state's ability to meet new climate goals under the Clean Power Plan. Doyle said many Democrats are sensitive to the issue of baseload generation but had little time to digest more than 100 pages of amendments added within the past 24 hours.

"If this bill has any chance of becoming law, and as it's written right now it doesn't, sometime between now and floor time ... we need to sit down" and discuss reliability, Doyle said.

Consumer-side technologies

The committee approved 28-21 an amendment from Rep. Mike Pompeo (R-Kan.) that would require state utility regulators to evaluate -- and make public within 90 days -- whether any subsidies for consumer-side technologies such as rooftop solar or electric vehicle charging stations are providing benefits for consumers.

Pompeo argued that ratepayers deserve to know what benefits they are receiving. "Rooftop solar and energy charging stations are fine," Pompeo said, adding that "we just need to be honest" with ratepayers about the costs.

But Pallone said the amendment would hinder the development of a technology that cuts carbon emissions.

"I think we need to encourage and support the solar industry," he said.

Hydropower

The committee approved by voice vote a bipartisan amendment that Reps. Cathy McMorris Rodgers (R-Wash.) and Jerry McNerney (D-Calif.) introduced to bolster hydropower, but only after Pallone voiced his opposition.

McMorris Rodgers and McNerney argued that federal licensing of hydro projects is taking too long even though they provide valuable, carbon-free power. McNerney said the language reflected compromise on both sides of the aisle that stands to make licensing move faster.

The amendment, a result of months of negotiations, would direct FERC to consult with agencies and tribes in developing a schedule for all federal approvals of nonfederal hydropower, and would authorize the U.S. courts of appeals to grant limited extensions of time as may be requested by agencies and tribes. The bill would also, among other things, expedite the licensing process for closed-loop pumped storage projects and establish an expedited FERC license amendment approval process for increasing hydropower capacity or efficiency.

But Pallone voiced his objection to the amendment, saying the language would give too much authority to FERC and other agencies while overlooking critical environmental protections.

"The problem is the language in this amendment has not been the subject of hearings or even circulated in the public prior to this hearing," he said, adding that farmers', conservationists' and other stakeholders' interests would be trampled. "This is a massive expansion of federal authority."

Strategic Petroleum Reserve

The committee rejected a Pallone amendment that would have increased authorized spending levels to modernize the Strategic Petroleum Reserve and for a grant program to boost the resiliency of electric infrastructure.

Pallone said increasing the funds may help eventually sway the White House toward signing the bill.

Upton said that Pallone's plan "was not a bad amendment" but that he was unable to support the proposed levels at the time.

"I'll let you know the door is definitely not shut," he told Pallone.

Reporter Geof Koss contributed.

APPROPRIATIONS:

Senate clears spending bill, sets up House action

Manuel Quiñones, E&E reporter

Published: Wednesday, September 30, 2015

The Senate approved legislation this morning to keep the federal government funded through Dec. 11, just hours before a potential shutdown.

The Senate voted 78-20 in favor of the continuing resolution despite pleas from conservative Republicans to defund the nonprofit Planned Parenthood over abortion concerns.

Beyond keeping the government open, the bill would provide emergency wildfire suppression funds. The House is scheduled to follow the Senate with a vote later this afternoon.

Beyond the current action, Senate Majority Leader Mitch McConnell (R-Ky.) said he will continue pushing for Congress to pass a series of yearlong appropriations bills. Next up, he said, is legislation to fund military construction and veterans' issues for fiscal 2016.

Democrats have been stalling spending bills from moving forward in the Senate, demanding instead talks toward a bipartisan budget agreement. McConnell hopes the military and veterans bill is too politically sensitive to block.

McConnell said this morning, "It's not right for [Democrats] to again force America into another short-term funding situation like this."

Both McConnell and Senate Democratic Leader Harry Reid (D-Nev.) have promised to engage in talks over spending levels for the next two years.

Reid said, "We should have started this process months ago. Better late than never. Hallelujah. Here we're ready to negotiate."

FEDERAL WORKFORCE:

Shutdown pay bill introduced in House

Kevin Bogardus, E&E reporter

Published: Wednesday, September 30, 2015

Reps. Don Beyer (D-Va.) and Rob Wittman (R-Va.) have introduced legislation that would ensure back pay for federal employees in the event of a government shutdown.

H.R. 3635, the "Federal Employee Retroactive Pay Fairness Act," would secure pay for government workers who would see their salaries suspended if there were a lapse of funding and agencies had to close their doors. The lawmakers introduced the bill yesterday and already have another 67 co-sponsors in support of the legislation.

Lawmakers have battled over whether to include federal funds in the government spending bill for reproductive health group Planned Parenthood -- seemingly threatening a governmentwide shutdown in the process. Nevertheless, the House is poised to pass a stopgap funding measure today before the government runs out of money (*see related story*).

In a statement, Beyer said Congress should not "jeopardize" federal employees' financial security.

"Federal employees have financial obligations just like everyone else. Congress must not jeopardize their financial security yet again," Beyer said. "This bipartisan legislation ensures that these public servants are made whole if Congress cannot keep our government running."

Wittman said, "It is critical to protect these public servants and their families from this uncertainty, and at the same time to bring accountability to the way Congress carries out its business. Long-term vision is necessary for ending this recurring cycle of governing by crisis."

In announcing the bill, both Beyer's and Wittman's offices noted that the lawmakers' Virginia districts are home to roughly 120,000 federal employees altogether.

Federal worker unions such as the American Federation of Government Employees and the National Treasury Employees Union have voiced support for the bill.

Sen. Ben Cardin (D-Md.) has introduced similar legislation in the upper chamber. His bill would guarantee pay for furloughed federal employees and was cheered by unions, as well (*E&E Daily*, Sept. 17).

RAIL:

Bill would extend installation deadline for safety system

Sean Reilly, E&E reporter

Published: Wednesday, September 30, 2015

Freight and commuter railroads would get another three years to implement the automated safety system known as positive train control under a bipartisan bill introduced today by leaders of the House Transportation and Infrastructure Committee.

The bill, H.R. 3651, would push back this year's Dec. 31 implementation deadline until the end of 2018; under somewhat different conditions, the Senate has already approved a three-year extension as part of H.R. 22, a reauthorization of road, rail and transit programs passed in July.

Congress set the current deadline in a 2008 law signed soon after a collision between freight and commuter trains killed 25 people in the Los Angeles area. Despite the seven-year window, most railroads can't meet the existing timetable, with some large freight carriers warning they will halt passenger traffic and some chemical shipments on their tracks after December for fear of the potential liability (*E&E Daily*, Sept. 17).

In a news conference yesterday, Transportation Secretary Anthony Foxx said many of the industry's concerns appear to be legitimate but reiterated that his agency will enforce the existing deadline "absent some congressional action."

In news releases accompanying today's bill introduction, House T&I leaders described more time for positive train control implementation as essential. They are proceeding with stand-alone legislation after hopes of moving a broader surface transportation authorization measure that would include an extension faltered over money issues.

"Railroads must implement this important but complicated safety technology in a responsible manner, and we need to give them the necessary time to do so," said Rep. Bill Shuster (R-Pa.), the committee's chairman.

The panel's top Democrat, Rep. Peter DeFazio of Oregon, voiced disappointment that the extension is needed, adding that he hoped the committee would soon take up the broader reauthorization measure that would include further safeguards on transportation of hazardous materials.

Also co-sponsoring the bill are Reps. Jeff Denham (R-Calif.) and Michael Capuano (D-Mass.), the chairman and ranking member, respectively, of the T&I Subcommittee on Railroads, Pipelines and Hazardous Materials.

Positive train control (PTC) is an umbrella term for an approach that uses a central dispatch office and wireless signals to stay in touch with a locomotive's computer and thus serve as an automated safety backup to the engineer. Railroads have cited the cost, regulatory snarls and technological hurdles as reasons for their inability to meet the existing deadline.

The new House bill would also grant the Department of Transportation the authority to phase in PTC implementation, an option the Obama administration prefers in lieu of a blanket rollback of the current deadline. Under certain conditions, individual railroads could qualify for additional extensions up until the end of 2020.

In a statement, Senate Commerce, Science and Transportation Chairman John Thune (R-S.D.), who has been leading the legislative push for an extension, said he is committed to working out a deal.

"Our country's economy cannot afford the significant disruptions that will occur if we don't act soon," Thune said. "Reaching an agreement and passing legislation in the coming weeks is the only way to avert a rail service shutdown."

In a separate statement, Ed Hamberger, the head of the Association of American Railroads, said he looked forward to working with House and Senate leaders "to quickly get the PTC extension across the finish line and to the President's desk for signature."

HOUSE:

GOP sets leadership elections for next week

Daniel Bush, E&E reporter

Published: Wednesday, September 30, 2015

House Republicans next week will hold their caucus's leadership elections.

Retiring House Speaker John Boehner (R-Ohio) announced today that the race for speaker and other leadership posts will be held Oct. 8, giving candidates one week to shore up support in a deeply divided GOP conference.

"After consulting with our conference, a large majority of our members have made clear they want these elections held next week," Boehner said in a statement.

Majority Leader Kevin McCarthy (R-Calif.) is widely expected to win the speaker's race against Rep. Daniel Webster (R-Fla.), though some members of the House GOP's conservative wing insist McCarthy doesn't have the 218 votes needed to clinch the race.

"It's clear that McCarthy doesn't have 218 votes yet," Rep. Thomas Massie (R-Ky.) said last night after House Republicans held a closed-door meeting on the caucus's future (*E&E Daily*, Sept. 30).

But others said McCarthy has the speaker's race locked up.

"I would be shocked if he does not [win]. I think he has the support of the vast majority" of the conference, Rep. Chris Stewart (R-Utah) said after the meeting.

The races for other leadership posts are less predictable, however. Majority Whip Steve Scalise (R-La.) and Budget Chairman Tom Price (R-Ga.) are vying to replace McCarthy as majority leader. Price received a boost earlier this week when powerful Ways and Means Chairman Paul Ryan (R-Wis.) endorsed him for the House GOP's No. 2 post.

Chief Deputy Whip Patrick McHenry (R-N.C.), Rules Chairman Pete Sessions (R-Texas), and Reps. Dennis Ross (R-Fla.) and Markwayne Mullin (R-Okla.) are running for majority whip.

The elections will be held less than two weeks after Boehner shocked the political world by announcing he would retire Oct. 30 (*Greenwire*, Sept. 25).

OIL:

Enviro leader floats crude exports deal

Daniel Bush, E&E reporter

Published: Wednesday, September 30, 2015

The chief of a top environmental group floated a compromise deal today that would lift the ban on crude oil exports in exchange for conservation measures and support for renewable energy production.

National Wildlife Federation CEO and President Collin O'Mara said his group would be more open to a House bill that would end the decades-old ban if lawmakers attached a wish list of environmental priorities, including language reauthorizing the Land and Water Conservation Fund and a provision extending renewable energy tax credits.

"With momentum appearing to build on both sides of the aisle for repealing export restrictions, Congress should insist that it be coupled with conservation measures to mitigate the impact of expanded oil development on wildlife and natural resources," O'Mara wrote in an op-ed published in *The Wall Street Journal* yesterday.

Specifically, O'Mara called for more funding to restore wildlife habitat, arguing it would give industry "greater regulatory certainty by reducing future listings under the Endangered Species Act."

House and Senate lawmakers should also reauthorize the LWCF, a program created in 1965 that is set to expire today if Congress doesn't act, O'Mara said.

O'Mara also waded into the debate over renewable energy tax credits, saying that extending incentives for clean energy would help lower carbon emissions.

"While [NWF] has deep concerns about lifting the ban on oil exports, the conservation measures outlined here would help secure the future of America's wildlife and our outdoor heritage," O'Mara wrote.

His op-ed comes as House lawmakers are set to move forward on a stand-alone bill that would lift the crude export ban.

AIR POLLUTION:

Exemption may stymie criminal case against Volkswagen

Published: Wednesday, September 30, 2015

Federal prosecutors may face challenges in bringing criminal charges against Volkswagen AG over its role in an emissions testing scandal because of exemptions in the Clean Air Act.

No automaker has ever faced criminal charges for skirting emissions standards. In part, that's because of a carve-out from criminal penalties inserted in the Clean Air Act of 1970 by industry-friendly lawmakers. That could force prosecutors to turn to other criminal statutes, such as charging Volkswagen with lying to regulators.

Sen. Richard Blumenthal (D-Conn.) pledged to introduce legislation to close the exemption. Rep. Fred Upton (R-Mich.), chairman of the House Energy and Commerce Committee, has called for hearings on the matter.

Former Rep. John Dingell (D-Mich.), a supporter of the auto industry who helped pass the Clean Air Act, said it was appropriate to focus on civil penalties.

"It's easier, speedier, quicker," Dingell said.

Volkswagen will still face significant enforcement action, he said.

"The cost to Volkswagen is going to be unbelievable," Dingell said. "The risk of them going out of business is very real" (Harder/Viswanatha, *Wall Street Journal*, Sept. 29). **-- SP**

CLEAN POWER PLAN:

Court rejects latest salvo from EPA foes

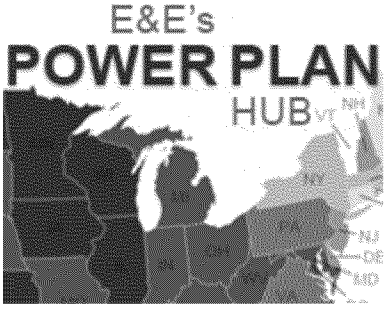
Robin Bravender, E&E reporter

Published: Wednesday, September 30, 2015

Federal judges have rebuffed the latest pre-emptive legal strike against U.S. EPA's landmark greenhouse gas standards for power plants.

The U.S. Court of Appeals for the District of Columbia Circuit yesterday denied requests from states and industries to reconsider the court's decision allowing the Obama administration to move ahead with its high-profile, contentious power plant regulations.

In another blow to EPA's opponents, judges also rejected a procedural maneuver that appeared to be aimed at keeping the same three Republican-appointed judges overseeing legal challenges to the rule.



In short orders issued yesterday, the court rejected requests for a rehearing en banc -- before all of the circuit's judges -- after a three-judge panel decided in June that the court wouldn't rule on the legality of the standards until they were finalized. The court rarely grants such rehearings, and the request was seen as a long shot (*Greenwire*, June 9).

The EPA rule has since been finalized but hasn't yet been published in the *Federal Register*, which will trigger a timeline for challenging the rule in court.

The appeals court judges also rejected requests to effectively put the legal challenges to EPA's proposed rule on ice until the final rule is published. EPA's challengers, including more than a dozen states led by West Virginia, said they plan to eventually challenge the final rule, and that keeping state and industry cases alive would save "substantial resources" for the court and the parties involved and allow for a speedier resolution.

That request, however, was widely viewed as an attempt by challengers to retain the three judges involved in the challenges to EPA's proposed rule. Brett Kavanaugh, Thomas Griffith and Karen Henderson were appointed by Republican presidents, and Kavanaugh in particular has a track record of ruling against EPA in high-profile cases (*Greenwire*, Aug. 14).

The court said in separate short orders yesterday that the challengers' request for a "stay of the mandate" in the case was denied.

Attorneys representing EPA told the court last month that despite petitioners' arguments that they wanted to "consolidate their planned future challenges to the final rule with these challenges to the proposed rule," they had offered "no legitimate basis for departing from established jurisdictional and judicial review principles in this manner."

The administration urged the court to dismiss the case, warning that linking challenges to EPA's final rule and previous court proceedings would "only invite all manner of premature challenges to proposed agency rules with the aim of gaining some perceived tactical advantage."

The court also last month denied states' "emergency motion" to consolidate another court challenge to EPA's power plant rule with the challenge to the proposal -- another effort to keep the three-judge panel overseeing the issue (*Greenwire*, Aug. 20).

BIOFUELS:

Biodiesel can help slash U.S. carbon emissions -- report

Amanda Reilly, E&E reporter

Published: Wednesday, September 30, 2015

Biodiesel can contribute significantly to U.S. carbon dioxide reduction goals, according to a new analysis released by the industry's main trade group.

The report conducted by Bates White Economic Consulting found that boosting biodiesel production would represent nearly 20 percent of the transportation sector's share of the United States' climate commitment by 2025.

"The bottom line is that, for a relatively small industry, biodiesel packs a powerful punch," said Ben Evans, a spokesman for the National Biodiesel Board, which commissioned the study.

NBB provided a summary presentation of the report to *Greenwire*.

Biodiesel, considered an advanced biofuel under the federal renewable fuel standard, is made from soybean oil, used cooking grease and animal fats. The United States last year used about 1.8 billion gallons of the fuel.

The analysis comes ahead of the December negotiations in Paris, where world leaders are hoping to emerge with a new international climate change accord. President Obama has pledged that the United States will reduce emissions by 26 to 28 percent by 2025 compared with 2005 levels.

According to the Bates White report, increasing biodiesel production by 350 million gallons a year between now and 2025 would represent 18 percent of transportation's share of that goal, or 5 percent of the economywide CO2 reduction that is needed.

The reduction would be equivalent to removing 11.5 million cars from U.S. highways, the report found.

The National Biodiesel Board said the data should prompt EPA to consider more aggressive biodiesel targets in its proposal earlier this year to set multiyear renewable fuel standard mandates.

POLITICS:

'Democracy has been hacked' by industry -- Al Gore

Published: Wednesday, September 30, 2015

Former Vice President Al Gore had some choice words for politicians who block efforts to combat global warming.

"Our democracy has been hacked," the environmental advocate and former presidential hopeful said during an interview in Miami. "Large contributors call the shots, and the politicians who are beholden to them respond to their instructions to jump by asking how high."

Gore was in Florida this week as part of a three-day climate science training session aimed at garnering support prior to the U.N. climate talks in Paris in November. The training, which aims to form a "climate corps," drew a crowd of 1,200.

Gore attacked the industry for creating political divides on an issue where science should take precedence.

"The carbon polluters ensured that. They give lots and lots of money in order to buy that polarization, and they attack anyone who supports climate science. They vilify anyone who advocates limitations on using the atmosphere as an open sewer," he said. "They get furious at anybody who tries to change things and make them more rational and sane. And so they've made it polarized."

While Gore lambasted politicians, he said that he is more than willing to meet with those who want to learn more.

That includes Florida Gov. Rick Scott (R), who last year originally refused to meet with climate scientists.

"I'm not sure he would be interested in hearing anything that I would have to say, honestly. I don't know the man, so maybe I shouldn't jump to that conclusion. But that's my impression," Gore said. "If he was genuinely interested in having a conversation about this, I would certainly do it."

Gore also said that though the political system is broken, there is hope in social media, which has the ability to cut through the partisan divides and promote reputable science.

"The new influence of social media and the Internet and people magnifying the impact of articles by journalists who really get to the heart of things, I think that's beginning to have an impact," he said. "So people shouldn't feel discouraged about it. Change is coming. Change is on the way. We're going to win this. But the route to victory goes through changes in the way our political system operates so that the public interest begins to count again" (Jenny Staletovich, *Miami Herald*, Sept. 29). **-- AW**

NUCLEAR WASTE:

Former Idaho Gov. Andrus sues DOE over spent fuel plan

Published: Wednesday, September 30, 2015

Idaho's former governor has made good on his vow to sue the U.S. Department of Energy to get what he is calling concealed information regarding a proposal to transport nuclear waste into the state.

Cecil Andrus (D), who served four terms as governor, is running up against his state's leaders, including current Gov. C.L. "Butch" Otter (R), about the plan to ship spent nuclear fuel to the Idaho National Laboratory from commercial reactors in other states.

Andrus said he thinks DOE's aim is to turn the nuclear research facility into a quasi-nuclear dump, since there is no permanent repository for highly radioactive waste anywhere else in the United States.

In his complaint filed yesterday in Boise's U.S. District Court, Andrus criticized DOE for withholding vital details about the proposal to thwart the public interest. Andrus said that the agency had responded to his Freedom of Information Act request with reams of mostly redacted documents and newspaper clips about its seeking a state waiver to allow the shipment of spent nuclear fuel to the Idaho National Laboratory.

"I suspect they know what they are planning will be very controversial and, for that reason, want to keep it secret," Andrus said in a statement.

Andrus and former Gov. Phil Batt (R) said in March that they would sue DOE for violating a 1995 legal agreement banning the shipment of nuclear waste into the state (*Greenwire*, March 6).

Otter and other state leaders have expressed support for the plan to ship the fuel to the lab for a research program on the condition that DOE meets unfulfilled cleanup obligations (Laura Zuckerman, Reuters, Sept. 29). **-- BTP**

FEDERAL AGENCIES:

GAO finds widespread vulnerabilities in securing data

Kevin Bogardus, E&E reporter

Published: Wednesday, September 30, 2015

Congress' watchdog has given mixed reviews to several federal agencies on their handling of computer and personal information security.

The Government Accountability Office's critical report, released yesterday, highlighted weaknesses and vulnerabilities at 24 federal agencies across the government.

The study comes in the wake of the Office of Personnel Management's massive data breach that included the theft of personal data of 21.5 million people. In addition, OPM has since found that more people, up to 5.6 million, have had their fingerprint information stolen as part of that breach (*Greenwire*, Sept. 23).

In its report, GAO said it found agencies continue to have weak spots when it comes to protecting their information and computer systems. That can leave the government exposed to growing cyberthreats and the disclosure of personal data.

"Our work and reviews by inspectors general highlight information security control deficiencies at agencies that expose information and information systems supporting federal operations and assets to elevated risk of unauthorized use, disclosure, modification, and disruption," the watchdog said.

The vulnerabilities in government information security persist while threats have spiked upward. GAO found that since fiscal 2006, the number of security incidents reported by federal agencies has grown from 5,503 to 67,168 in fiscal 2014 -- an increase of 1,121 percent.

GAO reviewed agencies' handling of information security from fiscal 2013 and 2014 and came across several problems.

For example, the watchdog uncovered that 22 of the 24 agencies it examined had weaknesses in their access controls to their computer systems.

In addition, 18 agencies didn't have adequate continuity of operations plans in the case of accident or sabotage.

Also, GAO found that 23 agencies in fiscal 2014 had poor security management.

In its report, GAO notes that its recommendations for better information security, along with similar suggestions from other watchdogs, have gone unimplemented for years by agencies.

"Until federal agencies take actions to implement the recommendations made by us and the inspectors general, federal systems and information as well as sensitive personal information about the public will be at an increased risk of compromise from cyber-based attacks and other threats," said GAO in its study.

FEDERAL WORKFORCE:

Employees to see largest health care spike in 5 years -- OPM

Published: Wednesday, September 30, 2015

Federal employees will see their share of health care premiums rise by an average of 7.4 percent next year, which is the largest increase in five years.

Employees will also have a chance to switch insurance plans, which could help reduce costs, the federal government said yesterday.

Premiums in the Federal Employees Health Benefits Program are going up by 6.4 percent, but a larger share of that will be borne by federal workers. About 70 percent of the total premium is paid by the federal government.

Officials yesterday defended the increases as in line with similar increases in health care premiums in the private sector, though union officials blasted them as burdensome to workers.

"We are still in a period of relatively modest increases," said John O'Brien, the Office of Personnel Management's director of health care and insurance.

American Federation of Government Employees President J. David Cox Jr. warned the increases would be difficult for federal workers (Eric Yoder, *Washington Post*, Sept. 29). **-- SP**

FEDERAL AGENCIES:

Behavioral science can improve government, save cash

Published: Wednesday, September 30, 2015

The federal government could learn a lot from behavioral science.

That's the idea behind a new Obama administration initiative to create a Social and Behavioral Sciences Team to help make the government function better.

So far, it seems to be working. An experiment last year had vendors that supply federal agencies fill out a slightly different form reporting the rebates they owe the government. Instead of having the companies sign the forms at the end, the signature box was at the beginning.

The change made a huge difference. Companies signing that they would answer truthfully at the beginning of the form reported owing an extra $1.59 million in rebates during the three-month experiment than vendors who signed the old forms at the bottom.

Now the Obama administration is urging agencies to use behavioral science to perform similar experiments.

"The goal is to help people who want to take a given step but may face some barriers," said Maya Shankar, who leads the new team. "You can do everything to make sure that a program is well-designed, but if it's not getting into the hands of people who are supposed to be benefiting from it, everything up to that point was for naught."

Much of behavioral science is based on common sense -- people are more influenced by the last thing they hear, tend to fear losses, are a little lazy and like completing simple tasks better -- said University of Chicago economist Richard Thaler, one of the founders of behavioral economics.

Because of this, Thaler said he believes the plan could result in widespread improvements in federal policies.

"They've been more worried about making sure it's legally perfect than making sure it's understandable to anybody," he said. "So there's a lot of room to simplify things" (Binyamin Appelbaum, *New York Times*, Sept. 29). **-- AW**

AIR POLLUTION:

New rule on oil refinery monitoring a long time coming

Amanda Reilly, E&E reporter

Published: Wednesday, September 30, 2015

For environmentalists and community groups, the Obama administration's new refinery rule is the culmination of a movement that began more than 15 years ago.

In the final rule released yesterday, U.S. EPA will begin requiring oil refiners to surround their properties with air monitors that give benzene readings every two weeks.

Since the 1990s, community groups in industrial areas -- particularly in California, Texas and Louisiana -- have been pushing for fence-line monitoring of air pollution stemming from refineries. They've had limited success; many have resorted to conducting their own monitoring.

To be sure, environmentalists and community advocates say they are disappointed with some aspects of EPA's final rule, including the lack of a requirement for real-time monitoring and the benzene threshold that triggers corrective action.

But, said Adrian Shelley, executive director of Air Alliance Houston, "there's no doubt that we are celebrating. A lot of us have been working on this for many, many years."

The movement for fence-line monitoring of air pollution at refineries began with the 1994 release of the chemical Catacarb from a refinery in Rodeo, Calif., according to Gwen Ottinger, a professor of science and technology studies at Drexel University who is working on a project on the history of refinery

community advocacy.

The Rodeo release lasted 16 days and brought together local groups that called for heightened monitoring.

"Fence-line monitoring would have prevented that if it had been real-time monitoring," Ottinger said. "After that, that community and others started to really advocate for fence-line monitoring."

Community groups began conducting their own monitoring. Anne Rolfes, for example, founded the Louisiana Bucket Brigade in 1999 to train local citizens to take air samples with inexpensive monitors that draw air samples into buckets.

The group has advocated for a nationwide requirement for fence-line monitoring at refineries.

"There have been roadblock after roadblock thrown up about why it can't happen," Rolfes said, "and yet there have been times after we have made a big, big fuss, when we give them the results of our samples, that they will start their own sampling."

A handful of refineries across the country have put in place monitoring systems at their fence lines, mostly prompted by community action and lawsuits, Ottinger said.

"You can point to instances around the country," she said, "but the idea that every refinery would have the obligation to provide people next door with information about what's in the air is just unprecedented."

Shelley of Air Alliance Houston said that efforts to add fence-line monitoring provisions in Texas have fallen flat because of a law that state air pollution regulations can't be more stringent than federal rules.

"The Texas Commission on Environmental Quality takes the position that it legally cannot put a term in a state permit that goes in excess of the federal floor," he said.

EPA's refinery rule arose out of a lawsuit filed by Earthjustice and the Environmental Integrity Project on behalf of community groups, including the Louisiana Bucket Brigade and Air Alliance Houston. The groups charged that EPA had missed a Clean Air Act deadline to review its hazardous air pollution standards for oil refineries.

The final rule requires petroleum refineries to install up to two dozen canisterlike monitors surrounding their properties.

"The primary benefit of the rule is, for the first time, communities will know how much benzene is falling from refineries to their communities' air," said Earthjustice attorney Emma Cheuse.

EPA added flexibilities in the final rule to appease oil refiners, including simplified flare requirements. According to the American Petroleum Institute, the final rule will cost refiners up to $1 billion -- expensive, but a far cry from the oil industry's initial estimate of a $20 billion cost for the proposed rule.

EPA, on the other hand, says that the final requirements will cost refiners $283 million in capital costs and $63 million annually.

While the oil industry yesterday applauded the changes in the final rule, the sector says that the requirements are unnecessary in the first place because refineries have already reduced their air pollution.

"Companies have already spent billions of dollars to reduce emissions by installing flare gas recovery and flare minimization systems to reduce greenhouse gas emissions," said Bob Greco, API's downstream director, "and air quality continues to improve as a result of these voluntary programs and existing regulations."

EPA officials yesterday said the fence-line monitoring provisions were specifically prompted by discussions with community groups (*E&ENews PM*, Sept. 29).

These groups say they'd like to see EPA eventually require real-time readings of air pollution. Real-time monitoring technology exists but doesn't capture benzene levels at the low concentrations that EPA is targeting in its final rule.

"We want something that will allow us to set off alarms and send text messages," Shelley said.

Community groups say they plan to use the data gathered through the rule to conduct their own independent analyses. They also plan to continue advocating for more stringent requirements and are leaving all options on the table, including future litigation.

"This is sort of a foot in the door. We now have a precedent for monitoring at refinery fence lines," Drexel University's Ottinger said. "Now, I think activists groups are unlikely to leave it at that. They'll keep advocating for better and more sophisticated monitoring."

AIR POLLUTION:

NAM leader bashes mayors for supporting lower ozone limit

Amanda Reilly, E&E reporter

Published: Wednesday, September 30, 2015

The head of the nation's manufacturing trade group this week chided 70 mayors who last week signed onto a letter supporting a tighter ozone standard.

In a letter to each of the mayors, National Association of Manufacturers President and CEO Jay Timmons said that the level they supported "would result in devastating economic consequences."

The mayors' letter last week, which was circulated by the Sierra Club, expressed support for a new standard at 60 parts per billion -- the low end of the range recommended by U.S. EPA's scientific advisers and the level called for by public health advocates (*Greenwire*, Sept. 22).

"If your city happens to fall out of compliance with the new standard," Timmons wrote, "the challenges for manufacturers become even greater -- and so do the challenges for your local government and citizens."

EPA is required to sign a new ozone standard by tomorrow under a court-ordered deadline. In November, the agency proposed to lower the standard from 75 ppb -- the limit set in 2008 during the George W. Bush administration -- to between 65 and 70 ppb. According to sources, EPA is poised to finalize a 70 ppb standard.

In their letter, the mayors from 24 states urged EPA to follow advice from the medical science community, which has recommended a 60 ppb standard based on studies that have linked higher levels to adverse health effects.

The manufacturing group has waged an aggressive campaign against a tighter standard. In his response to the mayors, Timmons enclosed a copy of a report that NAM commissioned last year that found a 60 ppb standard would cost the economy $270 billion a year.

"Manufacturers wanted to be sure you had all the facts about the 60 ppb standard and its negative impact on economic development and quality of life in your locality," Timmons wrote.

Outside experts and environmentalists have questioned the NAM study (*Greenwire*, Sept. 15). EPA's own analysis shows that a tighter standard would cost much less.

The Center for Regulatory Solutions, a group opposed to a tighter ozone standard, has also raised issues with the mayors' letter, noting that some of the signatories have previously called on EPA to retain the existing 75 ppb standard.

N.D. governor discusses two-track approach on power plan, shale oil's prospects amid price shift

Published: Wednesday, September 30, 2015

With a 45 percent emissions rate reduction in the final Clean Power Plan, what are North Dakota's plans for complying as it manages a power sector that runs primarily on coal? During today's OnPoint, North Dakota Gov. Jack Dalrymple (R) discusses his state's compliance and litigation plans for the Clean Power Plan. He also talks about the challenges facing his state's shale oil industry following the rapid decline of oil prices.

Chris,

The Liz is looking for TPs on the excess emissions from VW. Are you OK with these TPs for her?

The exact amount of the excess NOx emissions from the VW vehicles with the defeat device is a part of our ongoing investigation so I can't be specific on that point.

However, I can give you a sense of the scale of the issue. The number of affected VW vehicle currently on the road is roughly 480,000. The total number of (light and heavy duty) vehicles on the road today in the U.S is 253 million (an HIS stat I found). Also, our emissions models tell us that NOx emissions from light duty diesel cars and trucks contribute less than 0.1 percent of NOx pollution from on-road vehicles. The vast majority comes from heavy duty trucks and gasoline vehicles. Our air quality monitoring data shows that our air IS becoming cleaner. despite VW's actions.

One more request for Scheduling Purposes:

We would be delighted to offer Hair & Make-up for the Administrator:

If you would, please arrive by 7:20a.m.ET to allow time for both..

The Live talk-back will be at 8:10a.m.ET

And, if possible, following the live talk-back ..which will conclude by 8:16a.m.ET..

We would like to ask..if the Administrator..to tape a segment with Mike Bettes.

We have Launched this brand-new show..called Weather Underground..

Which air on prime-time from 6pm.-8pm.

It's a very scientific show..similar to weather geeks..but w/the focus on Millennials..

Would the Administrator's scheduling needs allow for a 10 minute taping?

And, finally, I would like to introduce the Administrator to Senior Vice President of Live Programming Nora Zimmet...as well as the President of Live David Clark..

Would her schedule allow for a quick 10 minute introduction..?

Thank you again for considering our requests..

We look forward to the visit..

Best Wishes...

Ioanna

Good morning Liz!

We will do our best...I will keep you posted on what we do. Thank you for including us in the Administrator's availability.

Also, in the future, if you would, please include us on the background calls.

Clearly, every major newspaper & television network, was a part of a background briefing for their Monday morning shows & publications.

Unfortunately, we were not included.

And, that already places in a disadvantage, when it comes to presentation & timely delivery.

As a result of this policy, we are so excited for all the great things that lie

ahead in terms of climate action. We will make sure to keep the dialogue and message alive past today's announcement...

Also, will the Administrator accompany President Obama on his trip to the Arctic?

Best Wishes..

Ioanna

Subject: Clean Power Plan info from EPA

Hi Ioanna,

I hope you're well! Liz suggested I get in touch with you about our Clean Power Plan release.

We're hoping that The Weather Channel could incorporate the plan into its social media efforts this week. To help with that, I drafted a few sample tweets, some of which are more general about the plan, and others of which delve more into air quality and share statistics about the Plan's impact. Feel free to use these as a basis as much as you like. They appear below my signature.

We also wanted to suggest a couple other ways The Weather Channel might be able to mention the Plan. Could you let us know if you might be able to take any of them on? We're happy to provide any material and assistance that we can to make them easier to do. Let us know.

-Create a website banner

driving traffic to www.whitehouse.gov/live for the event where President Obama and EPA Administrator Gina McCarthy will unveil the Clean Power Plan. It starts at 2 pm ET. Alternately, since time is short, create a banner focused on the Plan itself.

-Create a special alert or banner for The Weather Channel's app on either the live event or the Plan more generally.

-Post President Obama's remarks about the Plan on your website. We can provide them.

-Our Administrator will be posting two blog posts about the Plan. The first gives six key things to know about the Clean Power Plan, and the second shares her personal story working in public health, and how the experiences of families (especially families with kids who struggle with asthma) motivate her to keep working for clean air. If you could work them into a story or would be interested in incorporating them somehow, let us know and we can tell you more.

We'd welcome any other thoughts or ideas you have, and we'd be happy to help however we can.

Kind Regards,

Jay L. Davis

Cell: 202-748-3316

BIG NEWS TODAY: @EPA, @WhiteHouse unveiling #CleanPowerPlan at 2 pm ET. It will cut CO2 pollution from power sector.

Power plants are US' largest source of carbon pollution. #CleanPowerPlan is 1st rule to reduce carbon emissions.

Climate change affects all Americans, from stronger storms to longer droughts. #CleanPowerPlan will reduce CO2 pollution & #ActOnClimate.

.@EPA's #CleanPowerPlan will cut carbon pollution by 32% - or about 870 million short tons - from '05 levels by 2030.

The estimated climate & health benefits of @EPA's #CleanPowerPlan are as much as $54 billion in the year 2030 alone.

#CleanPowerPlan could mean up to 1.4 million fewer days where people must restrict activities due to air quality.

#CleanPowerPlan could prevent up to 300,000 missed school & work days in 2030 alone, due to improved air quality.

#CleanPowerPlan expected to cut air pollutants that help soot & smog form by more than 20%. That means cleaner air.

Amount of carbon pollution #CleanPowerPlan is expected to cut = 166 million cars, or 70% of US passenger vehicles.

Amount of carbon pollution #CleanPowerPlan will cut =

annual emissions from
powering 95% of US residences
for a year.

AN E&E PUBLISHING SERVICE

AIR POLLUTION:
Greens petition for tougher auto-emission testing

Sean Reilly, E&E reporter

Published: Thursday, October 1, 2015

Volkswagen's systemic cheating on vehicle emissions tests underscores the need for stiffer regulations, an environmental group said in a petition sent today to U.S. EPA and the National Highway Traffic Safety Administration.

In the 14-page **petition for rulemaking**, the Center for Biological Diversity asks EPA to test all diesel-powered vehicles sold in the United States since 2009 under real-world driving conditions and to require similar testing for all fossil-fuel-powered vehicles in the future.

The organization also wants the National Highway Traffic Safety Administration (NHTSA) to raise its maximum fines for violations of fuel economy standards to $10 for each 0.1-mile-per-gallon shortfall, up from $5.50, a level that has not changed since 1997, according to the petition.

Car companies "regularly choose to pay fines rather than comply with the standards, and government reports have indicated that this is because the fines are too low," Kristen Monsell, a staff attorney for the Arizona-based center, said in an email to *Greenwire* this morning.

On the emissions issue, Volkswagen's "appalling actions show why the EPA must require on-road tests to catch car company cheats," Monsell said in a news release. "Tougher tests will fight fraud and protect our health and climate from dangerous pollutants spewed by these cars."

Asked for comment, EPA spokesman Nick Conger said the agency looks forward "to reviewing the letter and responding accordingly." An NHTSA representative could not immediately be reached.

Last week, EPA officials told all automakers that added vehicle testing could be required to detect "defeat devices" similar to what Volkswagen used to sidestep emission standards on almost a half-million diesel cars sold in the United States for model years 2009 through 2015.

The petition asks EPA and NHTSA to act within 180 days; they could respond by granting the center's request in full or in part, or by denying it entirely, Monsell said. The center has the option of filing a lawsuit if its request for new regulations is turned down, she said.

While criticism of the current emissions enforcement regimen's reliance on lab

tests is not new, Monsell said she knew of no similar petition filed in the past. Besides harming public health, higher car emissions contribute to climate change, which poses "a significant threat to biodiversity" and is already leading to population declines and extinctions for plants and animal species, the petition says.

RE: Petition for Rulemaking to Implement New Emissions Testing for Motor Vehicles and Increase Penalties for Violations of Fuel Standards

Dear Administrator McCarthy and Administrator Rosekind,

The Center for Biological Diversity (the "Center") requests that you take immediate action to protect public health and the environment from the toxic impacts of greenhouse gas and nitrogen oxides emissions from motor vehicles, and from corporate practices designed to evade regulations restricting the quantity of these dangerous emissions. Specifically, pursuant to the Administrative Procedure Act, 5 U.S.C. § 553(e), Title II of the Clean Air Act ("CAA"), 42 U.S.C. §§ 7521-7554, and Title VI of the Energy Policy and Conservation Act ("EPCA"), 49 U.S.C. §§ 32901-32919, the Center requests that the U.S. Environmental Protection Agency ("EPA") and the National Highway Traffic Safety Administration ("NHTSA"):

(1) immediately conduct in-use emissions testing of each make and model of diesel-powered motor vehicles sold in the United States since 2009 that have not previously undergone such tests;

(2) immediately conduct in-use emissions testing of each make and model of other fossil fuel-powered motor vehicles sold in the United States since 2009 that have not previously undergone such tests;

(3) promulgate regulations to require on-road emissions testing for all types of new diesel-powered motor vehicles;

Alaska · Arizona · California · Florida · Minnesota · Nevada · New Mexico · New York · Oregon · Vermont · Washington, DC
Kristen Monsell, Staff Attorney, Oceans Program · 1212 Broadway, Suite 800 · Oakland, CA 94612
Phone: 510-844-7100 x 337 · Fax: 510-844-7150 · kmonsell@biologicaldiversity.org

(4) promulgate regulations to require on-road emissions testing for all other types of new fossil fuel-powered motor vehicles; and

(5) promulgate regulations to increase the penalties for violations of corporate average fuel economy standards.

As you are well-aware, Volkswagen recently admitted that 11 million of its diesel cars sold worldwide since 2009, including nearly half a million sold in the United States, contain software specifically designed to cheat emissions tests. The software — known as "defeat devices" — can detect when a car is being tested in a laboratory setting and adjusts engine operations to emit less-polluting exhaust during the test than in real-world driving conditions. EPA has said that these devices allowed each car to spew up to *40 times* the legal limit of nitrogen oxides emissions in the United States. Accordingly, in addition to the specific actions requested above, **the Center also requests that EPA assess the maximum permissible penalties against VW for such egregious violations of law.**

This widespread fraud not only deceived consumers who purchased VW cars based on the belief the cars were "clean diesel," but is a significant threat to public health and the environment. Emissions of nitrogen oxides contribute to climate change and ocean acidification — nitrogen oxides react with other substances to form the greenhouse gas ozone, and contain a highly potent and long-lived greenhouse gas. In addition, ground-level ozone can trigger or worsen asthma and other respiratory ailments, make the lungs more susceptible to infection, damage vegetation and reduce crop yields. Nitrogen oxides are also a precursor to particulate matter which causes breathing problems, lung tissue damage and premature death.

To make matters worse, the use of such devices, and thus unlawful emissions of such dangerous pollutants, may not be limited to VW. Indeed, defeat devices have existed almost since the inception of the CAA, and EPA has previously levied fines against car and truck manufacturers for the use of such devices. Recent reports indicate that tests of on-road emissions of cars made by other companies exceed that of laboratory testing, indicating that these manufactures might also be using defeat devices — or, at a minimum, are not performing as required. Despite the existence of technology that can measure emissions during normal operation and use, EPA does not require such tests for the vast majority of motor vehicles.

And the recent scandal highlights yet another industry-wide problem — that car manufacturers routinely pay fines, rather than comply with mandatory fuel economy standards that seek to improve fuel efficiency and reduce carbon dioxide emissions. As we have frequently pointed out, and as government reports indicate, the meager fines are too low to act as a deterrent, thereby failing to inspire the technological innovation contemplated by EPCA and the CAA. Yet NHTSA has not increased the penalty for violation of the standards in nearly two decades.

Comprehensive action is therefore needed to ensure long-term solutions to such pervasive problems. Taking the actions requested in this petition will improve the accuracy of emissions testing of motor vehicles and help ensure against future deception, and incentivize compliance with fuel economy standards intended to reduce greenhouse gas emissions and improve energy security. In other words, granting this petition will help better protect public health and the

environment from dangerous air pollutants from motor vehicles, while ensuring fuel economy continues to improve as intended by the CAA and EPCA.[1] The Center requests that EPA and NHTSA take the regulatory actions requested in this petition within 180 days.

I. Factual Background: Harmful Emissions from Motor Vehicles

As the VW scandal demonstrates, motor vehicles emit harmful air pollutants. In fact, according to the Union of Concerned Scientists, transportation is the largest single source of air pollution in the United States.[2] Motor vehicles emit carbon dioxide, oxides of nitrogen, particulate matter, hydrocarbons, carbon monoxide, sulfur dioxide, as well as benzene and other hazardous air pollutants.[3] These emissions contribute to a myriad of public health problems, negative impacts to public welfare and the environment, and climate change.

A. Emissions from Motor Vehicles Are Harmful to Public Health

Motor vehicles emit air pollutants that cause or contribute to health problems, including nitrogen oxides. For example, ground level ozone is created by chemical reaction between nitrogen oxides and volatile organic compounds. Ground-level ozone pollution is linked to many public health impacts, especially those related to respiratory function. Ozone can irritate the respiratory tract and throat, impair lung function, and cause coughing, chest pains and lung inflammation.[4] EPA has recognized the association between ozone exposure and hospital visits for respiratory problems — especially for children — noting that ozone pollution is responsible for as much as twenty percent of all summertime respiratory hospital visits.[5] Ozone is also linked to the development of respiratory diseases, such as asthma.[6] But the health effects of ozone are not limited to respiratory illnesses. Ozone pollution is linked to other serious health impacts, such as heart disease and certain types of strokes.[7] "[M]ost importantly," according to the American Lung Association, ozone exposure and the associated health impacts can shorten lives

by months and even years.[8] "Even at very low levels including days that meet current regulatory requirements," ozone is associated with premature mortality.[9]

Ozone also has detrimental ecological effects. According to EPA, ozone "affects sensitive vegetation and ecosystems, including forests, parks, wildlife refuges, and wilderness areas," especially during growing seasons.[10] Ozone can interfere with a plant's ability to produce and store food, visibly damage leaves, and make plants susceptible to damage from disease, insects, competition and severe weather.[11]

Nitrogen oxides also mix with other air pollutants to create particulate matter ("PM"). The effects associated with PM exposure are "premature mortality, increased hospital admissions and emergency department visits, and development of chronic respiratory disease."[12] California has identified diesel PM as a toxic air contaminant and has estimated that 70 percent of the cancer risk from the air Californians breathe is attributable to diesel PM; EPA says that diesel PM is "likely to be a carcinogen."[13] Diesel exhaust is a major contributor to PM pollution. In fact, it is estimated that diesel-powered vehicles and equipment account for nearly half of all nitrogen oxides and more than two-thirds of all PM emissions from U.S. transportation sources.[14]

B. Emissions from Motor Vehicles Contribute to Climate Change

The burning of fossil fuels is the largest source of domestic greenhouse gas emissions, accounting for 77 percent of total warming emissions in 2013.[15] One of the primary sources of such emissions is from the transportation sector, which in 2013 accounted for 27 percent of all greenhouse gas emissions in the United States.[16] The largest source of such emissions from the transportation sector is passenger cars, representing nearly 43 percent of emissions in 2013.[17]

VW FOIA, EPA 06/20/2017 2017-FFP_028412

The transportation sector has been the fastest-growing source of greenhouse gas emissions since 1990.[18]

Carbon dioxide is the dominant greenhouse gas driving observed changes in the Earth's climate.[19] Emissions of nitrogen oxides also contribute to climate change through two primary means: (1) nitrogen oxides react with other substances to form the greenhouse gas ozone; and (2) nitrous oxide is itself a highly potent and long-lived greenhouse gas. Nitrous oxide behaves very similarly to carbon dioxide in that it both directly traps heat in the atmosphere and remains in existence for many decades once emitted.[20]

There is a strong, international scientific consensus that anthropogenic climate threatens human society and natural systems. The U.S. Global Change Research Program in its 2009 report *Climate Change Impacts in the United States* similarly stated that "global warming is unequivocal and primarily human-induced" and "widespread climate-related impacts are occurring now and are expected to increase."[21] The U.S. National Research Council similarly concluded that "[c]limate change is occurring, is caused largely by human activities, and poses significant risks for — and in many cases is already affecting — a broad range of human and natural systems."[22] Based on observed and expected harms from climate change, in 2009 EPA concluded that greenhouse gas pollution endangers the health and welfare of current and future generations.[23] Current atmospheric concentrations of greenhouse gases are already resulting in significant climate change impacts that are projected to worsen as emissions rise.[24]

Key changes include warming temperatures, the increasing frequency of extreme weather events, rapidly melting glaciers, ice sheets, and sea ice and rising sea levels.[25] There will be significant costs associated with these changes. For example, in the United States in 2011 alone, a record 14 weather and climate disasters occurred, including droughts, heat waves, and floods, that cost at least $1 billion each in damages and loss of human lives.[26] In addition, air pollution components that trigger asthma attacks, specifically air particulates and ozone, are expected to increase with climate change;[27] in 2020, the continental United States could pay an average of

$5.4 billion (2008$) in health impact costs associated with the climate penalty on ozone, with California experiencing the greatest estimated impacts averaged at $729 million.[28]

Anthropogenic climate change also poses a significant threat to biodiversity. Climate change is already causing changes in distribution, phenology, physiology, genetics, species interactions, ecosystem services, demographic rates and population viability: many animals and plants are moving poleward and upward in elevation, shifting their timing of breeding and migration, and experiencing population declines and extirpations.[29] Because climate change is occurring at an unprecedented pace with multiple synergistic impacts, climate change is predicted to result in catastrophic species losses during this century.

The Intergovernmental Panel on Climate Change ("IPCC") concluded that 20 to 30 percent of plant and animal species will face an increased risk of extinction if global average temperature rise exceeds 1.5°C to 2.5°C relative to 1980-1999, with an increased risk of extinction for up to 70 percent of species worldwide if global average temperature exceeds 3.5°C relative to 1980-1999.[30] Other studies have predicted similarly severe losses: 15 to 37 percent of the world's plants and animals committed to extinction by 2050 under a mid-level emissions scenario;[31] the potential extinction of 10 to 14 percent of species by 2100 if climate change continues unabated;[32] and the loss of more than half of the present climatic range for 58 percent of plants and 35 percent of animals by the 2080s under the current emissions pathway, in a sample of 48,786 species.[33] Scientists have warned that the Earth is fast approaching a global "state-shift" that could result in unanticipated and rapid changes to Earth's biological systems.[34] As summarized by the 2014 National Climate Assessment, "landscapes and seascapes are changing rapidly, and species, including many iconic species, may disappear from regions where they have been prevalent or become extinct, altering some regions so much that their mix of plant and animal life will become almost unrecognizable."[35]

In addition, the ocean's absorption of anthropogenic greenhouse gas emissions, including both carbon dioxide and nitrogen oxides, has already resulted in more than a 30 percent increase

in the acidity of ocean surface waters, at a rate faster than anything believed to have occurred in the past 300 million years.[36] Ocean acidity is projected to increase by 150 to 200 percent by the end of the century if carbon dioxide emissions continue unabated.[37] Ocean acidification negatively affects a wide range of marine species by hindering the ability of calcifying marine creatures to build protective shells and skeletons and by disrupting metabolism and critical biological functions.[38] The adverse effects of ocean acidification are already being observed in wild populations, including reduced coral calcification rates,[39] dissolution of pteropod shells in the California Current,[40] reduced shell weights of foraminifera in the Southern Ocean,[41] and mass die-offs of larval Pacific oysters in the Pacific Northwest.[42]

II. Legal Background: The Regulation of Emissions from Motor Vehicles

Given the negative impacts on public health and the environment caused by the emission of air pollutants from various sources, including the transportation sector, Congress has enacted several laws to regulate and limit the amount of air pollutants from motor vehicles.

A. The Clean Air Act

In enacting the CAA, Congress found that "that the growth in the amount and complexity of air pollution brought about by urbanization, industrial development, *and the increasing use of*

VW FOIA, EPA 06/20/2017 2017-FFP_028415

motor vehicles, has resulted in mounting dangers to the public health and welfare, including injury to agricultural crops and livestock..."[43] Accordingly, the CAA establishes a comprehensive scheme "to protect and enhance the quality of the Nation's air resources so as to promote the public health and welfare and the productive capacity of its population."[44]

To reach these goals, Title II of the CAA prescribes a regulatory scheme to control emissions from mobile sources.[45] Specifically, the CAA requires EPA to promulgate regulations that establish standards for the emissions of air pollutants from new motor vehicles that "cause, or contribute to, air pollution which may reasonably be anticipated to endanger public health or welfare" and prohibits exceedances of those standards.[46] The CAA mandates that EPA set emission standards for particular pollutants from light and heavy duty vehicles, including carbon monoxide, hydrocarbons and oxides of nitrogen and amend the standards as necessary to protect public health and welfare.[47]

Pursuant to these statutory requirements, EPA has established emissions standards and testing procedures for light duty vehicles and heavy trucks.[48] To ensure compliance with these standards, EPA requires manufacturers to receive a certificate of conformity from EPA before a manufacturer can introduce vehicles into U.S. commerce.[49] To receive such a certificate, manufacturers must submit a detailed application to EPA for each test group of vehicles it intends to sell in the United States; the application must include a certification that the vehicles comply with emission standards as determined by specific testing procedures required by EPA, and a description of any air emission control devices contained within the vehicles.[50] The CAA provides for a fine of up to $37,500 for each car that does not conform to details within the certificate of compliance.[51]

In recognition of the fact that manufacturers may attempt to circumvent emission standards, the CAA prohibits any person from manufacturing, selling, offering to sell or installing any part in a motor vehicle that bypasses, defeats or renders inoperative any device or element of a vehicle's emission control technology.[52] EPA's implementing regulations specifically prohibit the use of "defeat devices," defined generally as an air emission control device "that reduces the effectiveness of the emission control system under conditions which may reasonably be expected to be encountered in normal vehicle operation and use…"[53] Under the CAA and EPA's regulations, manufacturers may be liable for up to $3,750 for each use of a defeat device.[54]

B. The Energy Policy and Conservation Act

Congress enacted the EPCA in 1975 following the energy crisis caused by the 1973 Mideast oil embargo.[55] In enacting EPCA, Congress observed that "[t]he fundamental reality is that this nation has entered a new era in which energy resources previously abundant, will remain in short supply retarding our economic growth and necessitating an alteration in our life's habitats and expectations."[56] Among the goals of EPCA are to "'decrease dependence on foreign imports, enhance national security [and to] achieve the efficient utilization of scarce resources...'"[57] The fundamental purpose of EPCA, however, is energy conservation.[58]

To comply with these goals, EPCA vests NHTSA with broad regulatory authority,[59] and requires NHTSA to set fuel economy standards at "the maximum feasible average fuel economy level that the Secretary decides the manufacturers can achieve in that model year."[60] In this way, EPCA is meant to encourage technological innovation — meaning new technologies, not simply better versions of what exists today. As the court in *Center for Auto Safety v. Thomas* noted, "[t]he experience of a decade leaves little doubt that the congressional scheme in fact induced manufacturers to achieve major technological breakthroughs as they advanced towards the mandated goal."[61] And as explained by the D.C. Circuit "when a statute is technology forcing, the agency can impose a standard which only the most technologically advanced plants in an industry have been able to achieve — even if only in some of their operations some of the time."[62]

In 2007, Congress passed the Energy Independence and Security Act of 2007 ("EISA"), which amended EPCA.[63] The EISA eliminated the previous 27.5 mpg standard for passenger cars with a mandate that NHTSA set separate passenger car and light truck standards for each model year beginning in 2011 "to achieve a combined fuel economy average for model year 2020 of at least 35 miles per gallon for the total fleet of passenger and non-passenger automobiles manufactured for sale in the United States for that model year."[64] Fuel economy standards for model years 2021 through 2030 must be the maximum feasible average fuel economy standard for each fleet of passenger and non-passenger cars for that model year.[65] These standards are known as the corporate average fuel economy ("CAFE") standards.

[64] 49 U.S.C. § 32902(b)(2)(A).
[65] *Id.* § 32902(b)(2)(B).

To help manufacturers comply with the CAFE standards, EPCA prescribes civil penalties that NHTSA can impose if their cars do not meet regulatory requirements. Specifically, a manufacturer is liable for a civil penalty of five dollars per automobile for each 0.1 mile per gallon shortfall.[66] The Act vests NHTSA with the authority to raise the total penalty up to ten dollars for each 0.1 mile per gallon shortfall, provided it first makes certain findings. NHTSA raised the penalty to $5.50 for each 0.1 mile per gallon shortfall in 1997, but has not raised it since, nor has the penalty been adjusted for inflation.[67]

III. The VW Scandal Reveals the Need to Issues Regulations to Amend Testing Procedures and Increase Penalties for Violations of Fuel Economy Standards

Volkswagen recently admitted that 11 million of its diesel cars sold worldwide since 2009, including nearly half a million sold in the United States, contain software specifically designed to cheat emissions tests. EPA has said that these devices allowed each car to spew up to *40 times* the legal limit of nitrogen oxides in the United States. Better testing procedures that more accurately reflect a vehicle's on-road emissions could prevent such egregious actions from occurring in the future.

This scandal raises yet another problem in the government's regulation of emissions from motor vehicles — that manufacturers regularly pay civil penalties rather than comply with NHTSA's CAFE standards. The penalties are therefore clearly inadequate to deter violations and inspire the technological innovation contemplated by EPCA, and reduce carbon dioxide emissions, and must be increased as a result.

A. EPA Must Promulgate Regulations to Require On-Road Emissions Testing, and Must Test Cars Sold in the United States Since 2009

The VW scandal demonstrates that EPA's current testing procedures for passenger cars and light trucks do not accurately reflect the actual emissions of these vehicles. EPA must promulgate regulations that require accurate, on-road testing sufficiently rigorous to detect defeat devices and thereby protect public health and welfare from the deleterious impacts of motor vehicle emissions.

As explained by EPA in its Notice of Violation to VW, "defeat devices" can detect when a car is being tested in a laboratory setting and adjusts engine operations to emit less-polluting exhaust during the test than in real-world driving conditions. Specifically, VW manufactured and installed software in the electronic control modules ("ECM") of vehicles equipped with 2.0 liter diesel engines.[68] The software could sense when the vehicle was being tested pursuant to EPA's dynamometer testing equipment.[69] When the software sensed testing, it produced compliant emission results under an ECM calibration, but at all other times the ECM ran a separate calibration that reduced the effectiveness of the emission control system, and the selective

[68] EPA, Notice of Violation to Volkswagen AG, Sept. 18, 2015.
[69] *Id.*

VW FOIA, EPA 06/20/2017 2017-FFP_028418

catalytic reduction, or the lean NOx trap, in particular.[70] EPA has determined that the software is an air emission control device that was not described in VW's certification applications and is an illegal defeat device, and that "VW violated section 203(a)(1) the CAA, 42 U.S.C. § 7522(a)(1), each time it sold, offered for sale, introduced into commerce, delivered for introduction into commerce, or imported…" one of the offending vehicles as a result.[71]

But this is not the first time a manufacturer has used these illegal, deceitful devices. Despite the express prohibitions on the use of defeat devices in the CAA and EPA's regulations, the use of such devices by a variety of manufacturers has been discovered on several occasions.[72] Indeed, such devices have been used beginning shortly after the enactment of the CAA, with early regulatory actions specifically intended to prevent their use.[73] And car and truck manufacturers have repeatedly been caught using such devices for almost as long as their use has been prohibited. For example, in 1973, EPA found that VW had installed temperature-sensitive devices that turned off emissions controls on tens of thousands of its vehicles.[74] And in 1998, the U.S. Department of Justice and EPA settled an enforcement case against the diesel engine industry for the widespread use of defeat devices in everything from tractor trailers to pick-up trucks. The settlement required seven companies, which comprised 95 percent of the U.S. heavy duty diesel engine market, to pay over one billion dollars, including $83.4 million in civil penalties, the largest ever imposed in environmental enforcement at that time.[75]

As suggested by EPA's letter to VW, a key reason vehicle manufacturers are able to use such devices to beat emissions tests are the inadequate testing procedures currently required by EPA. In particular, EPA's requirements for testing light-duty vehicles and trucks, known as the Federal Test Procedure ("FTP"), use a chassis dynamometer to test for various emissions, including nitrogen oxides, in a laboratory setting by simulating driving conditions. But given the artificial, predictable conditions in which the tests are run, software can sense when treadmill-like dynamometer equipment is being used based on the position of the steering wheel, vehicle speed and how long the engine operates, among other inputs.[76]

But alternative, on-road testing technologies exist. For example, on-road vehicle remote sensing is a type of technology that can scan the emissions of thousands of vehicles within a single day, and has previously been used to monitor real driving conditions by using optical sensors or a laboratory vehicle that follows cars and samples exhaust plumes.[77] And EPA already

---

[75] U.S. Dep't of Justice, Press Release: DOJ, EPA Announce One Billion Dollar Settlement With Diesel Engine Industry For Clean Air Act Violations, Oct. 22, 1998, *available at* http://www.justice.gov/archive/opa/pr/1998/October/499_enr.htm.
[76] Notice of Violation to Volkswagen.
[77] International Council on Clean Transportation, Guidance note about on-road vehicle emissions remote sensing, June 2013, *available at* http://www.theicct.org/sites/default/files/publications/RSD_Guidance_BorKlee.pdf.

requires on-road testing for heavy-duty diesel trucks.[78] Specifically, EPA has established a mandatory manufacturer-run, in-use emissions testing for heavy-duty diesel trucks using a portable emission measurement system ("PEMS").[79] PEMS typically involves equipping a test vehicle with a portable gas analyzer, and measuring emission rates during the driving. In announcing the regulatory change, EPA specifically noted that using such systems is "a significant step forward. . . in helping ensure that heavy-duty diesel engines comply with applicable emission standards" and that "these systems offer[] advantages over conventional approaches to assess in-use exhaust emissions from engines for design improvement, research, modeling, and compliance purposes."[80] Nevertheless, EPA has not implemented a similar requirement for passenger cars and light trucks.

The urgent need for such testing is now beyond dispute, and its benefits would not be limited to detecting the use of unlawful defeat devices alone. Even when cars do not contain defeat devices, the laboratory tests often fail to accurately reflect emissions as laboratory settings do not adequately incorporate road and weather conditions, use of accessories and aggressive driving. On-road tests reflect normal operation and use, and therefore a more accurate picture of emissions. And the benefits would not be limited to emissions of nitrogen oxides — the use of on-road emissions testing would also enable tests to more accurately reflect a vehicle's fuel efficiency and thus, its carbon dioxide emissions.

While current regulations vest EPA with the authority to conduct or require testing on any vehicle using driving cycles and conditions that may reasonably be expected to be encountered in normal operation and use (i.e., on-road conditions) for purposes of investigating the use of defeat devices,[81] the regulations do not go far enough as they do not mandate such inspections prior to putting new cars and light trucks on the road.[82] Mandating on-road inspections prior to the introduction of new light-duty motor vehicles is thus necessary to ensure cars comply with emission standards.

Accordingly, the Center hereby requests that EPA promulgate regulations to require on-road testing for all types of new diesel-powered motor vehicles not already subject to such testing requirements. The Center also requests that EPA promulgate regulations to require on-road testing for all other types of fossil fuel-powered motor vehicles. While VW's scandal involved diesel-powered cars, there is no indication that the use of such devices is limited to diesel vehicles. In fact, recent reports indicate that VW's gasoline-powered cars, as well as models from other manufacturers, consume significantly more fuel than measured in laboratory tests.

[79] *Id.*

[80] *Id.*

[81] 40 C.F.R. § 86.1809.

[82] *See e.g.*, International Council on Clean Transportation, In-use emission testing of light-duty diesel vehicles in the U.S., May 30, 2015, *available at* http://www.theicct.org/sites/default/files/publications/WVU_LDDV_in-use_ICCT_Report_Final_may2014.pdf (noting that there is no regulatory requirement in the United States to verify compliance of Tier 2 vehicles for emissions standards over off-cycle tests such as on road emissions testing).

Specifically, the Center requests that EPA adopt regulations in 40 C.F.R. part 86 and/or 1066 requiring on-road emissions testing as part of the certification process necessary to introduce any vehicle type into U.S commerce. These regulations could emulate those required for heavy-duty highway engines, adjusted as necessary to accommodate testing parameters needed for passenger cars and lighter trucks, and require state-of-the art on-road emission testing technology.[83]

The Center also requests that EPA conduct immediate in-use testing of each make and model of diesel-powered motor vehicles sold in the United States since 2009 that have not already undergone such tests, and each make and model of other fossil fuel-powered motor vehicles sold in the United States since 2009[84] to ensure that emissions comply with relevant standards, and any additional violators are held accountable.

B. NHTSA Must Promulgate Regulations to Increase the Penalties for Violations of CAFE Standards

NHTSA must increase the penalty for violations of CAFE standards. As explained above, EPCA vests NHTSA with the authority to impose a civil penalty of five dollars per automobile for each 0.1 mile per gallon a car falls short of the standards.[85] EPCA also vests NHTSA with the authority to increase the penalty for violations, provided it first makes certain findings. These findings include that increasing the penalty "will result in, or substantially further, substantial energy conservation for automobiles in model years in which the increased penalty may be imposed; . . . will not have a substantial deleterious impact on the economy of the United States, a State, or a region of a State" and will not cause significant unemployment, a significant increase in automobile imports or adversely affect competition.[86]

NHTSA exercised its statutory authority to increase the maximum civil penalty to $5.50 for each 0.1 mile per gallon shortfall in 1997. But NHTSA has not increased the penalty since, nor has it been adjusted for inflation. It is no surprise then that NHTSA has repeatedly acknowledged that many companies choose to regularly pay the fines rather than comply with the standards.[87] Indeed, the Government Accountability Office ("GAO") has reported that because the fines for violations of the CAFE standards have not increased, "CAFE penalties may not provide a strong enough incentive for manufacturers to comply with CAFE."[88] In this way, EPCA has not been implemented to its full potential, and continuing technological innovation and reductions in greenhouse emissions are thwarted. However, the GAO also found that "stricter penalties" for "noncompliance could improve compliance with CAFE standards."[89]

---

[83] *See* 40 C.F.R. part 1065 (emission testing requirements for heavy-duty highway vehicles).
[84] To the extent conducting these tests is not feasible, the Center alternatively requests that EPA conduct in-use testing of a significant portion of the top selling makes and models of motor vehicles in the United States.
[85] 49 U.S.C. § 32912(b).
[86] *Id.*
[87] GAO, Report to Congress, Vehicle Fuel Economy: NHTSA and EPA's Partnership for Setting Fuel Economy and Greenhouse Gas Emissions Standards Improved Analysis and Should Be Maintained, Feb. 2010, GAO-10-336, *available at* http://www.gao.gov/assets/310/301199 html.
[88] *Id.*
[89] *Id.*

Accordingly, the Center hereby requests that NHTSA promulgate regulations to increase the penalty for a violation of the CAFE standards. Specifically, the Center requests that NHTSA amend its regulation at 49 C.F.R. § 578.6(h)(2) to increase the penalty to the statutory maximum of $10 per 0.1 mile per gallon shortfall. The Center believes that NHTSA can easily make the requisite statutory findings in order to do so. Ensuring compliance with CAFE standards will promote competition by encouraging innovation and technological improvements, and will lead to economic benefits by reducing costly greenhouse gas emissions.[90] And the requested increase in the penalty is reasonable, as it is still below the statutory minimum adjusted for inflation. Specifically, the five dollar fine in 1975 adjusted for inflation would be roughly $22.15 today.[91]

IV. Conclusion

The transportation sector is the single largest source of air pollution and the second largest source of greenhouse gas emissions in the United States. While there are laws in place to attempt to reduce the impacts of these emissions by prescribing limits on the quantity of such emissions, the recent VW scandal reveals that car manufacturers often find ways to skirt such requirements. Improving testing procedures by requiring in-use testing of vehicles currently on the road, and on-road testing of all new motor vehicles in the future would help ensure emissions tests better reflect actual emissions, and thus provide a more accurate picture of whether car manufacturers are actually complying with emission standards. Similarly, increasing the penalties for a violation of the CAFE standards would incentivize compliance with fuel economy standards and reduce emissions of greenhouse gases from motor vehicles. All of these actions would promote the protection of public health, welfare and the environment by reducing dangerous emissions and reducing our dependency on dirty fossil fuels, as envisioned by the CAA and EPCA.

Dear Anna,

Thanks for arranging the meetings for Christian Hey yesterday. I thought the discussions with your colleagues working on TTIP were particularly interesting. I am afraid I didn't catch Danielle's last name. Can you send me her details?

As promised, regarding the visit of Alexander Dobrindt, German Federal Minister of Transport and Digital Infrastructure: Minister Dorbindt will be in DC October 27 and would very much like to meet Administrator Gina McCarthy and her staff working on the Volkswagen case.

Thanks for your help once again and I hope you are going to have a nice hurricane-free time on your vacation.

Best,

Michael

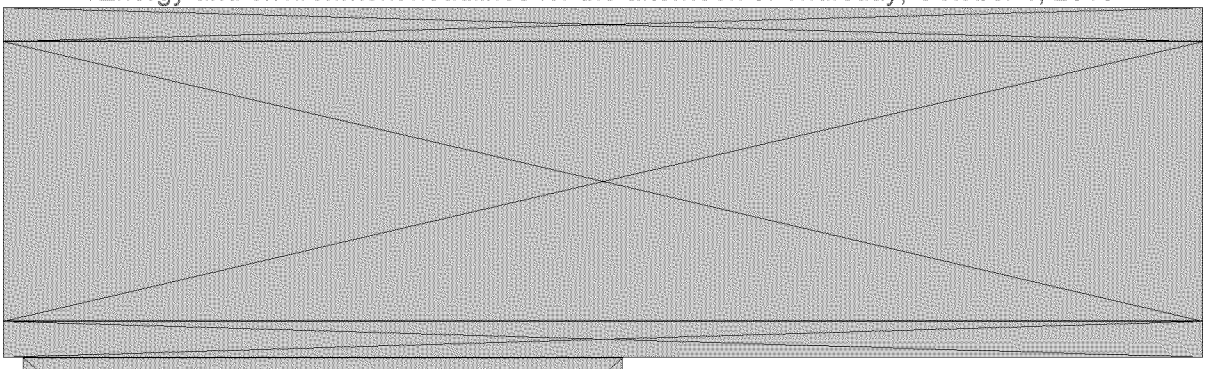
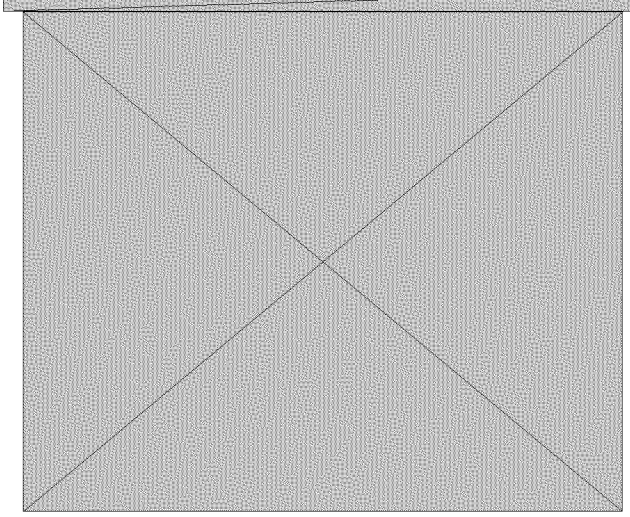
Energy and environment headlines for the afternoon of Thursday, October 1, 2015





McCarthy fights off ozone critics on all sides

By Kevin Rogers

Environmental Protection Agency Administrator Gina McCarthy, under fire from both industry and environmentalists over the agency's move to tighten its ground-level ozone standard to 70 parts per billion, on Thursday defended what she described a "judgment call" based on the best available science and the legal requirements of the Clean Air Act.

The agency's final rule, unveiled Thursday, was decried as "burdensome, costly and misguided" by industry groups and Republicans, who vowed to roll it back through legislation, while environmentalists and health advocates called it "insufficient," saying

didn't go far enough to protect public health.

McCarthy, however, said that the law requires her to develop a "requisite" standard that would provide "an adequate margin of safety." Based on the agency's analysis of nearly 2,300 studies, she concluded that 70 ppb was the optimal level.

"I must set a standard that, in my judgment, is no more or less stringent than necessary to protect at-risk groups," she told reporters on a call. "I did not base it on a popularity contest. This is about doing what the science says and the law, and I think I have a long history with all sides of being a person who does my job the best I can."

The new standard, while lower than the 75 ppb established by the Bush administration in 2008, fell on the high end of EPA's proposal. The agency took comment on setting the standard as low as 60 ppb.

The rules don't directly set new federal source pollution standards, instead leaving it to the states to develop their own implementation plans to meet the federal ozone level requirement. Those plans could include a mix of pollution controls on the manufacturing, energy production and transportation sectors, to reduce emissions of nitrogen oxide and volatile organic compounds. How much each sector must do, and how much of each pollutant is reduced, is up to each state, as long as the 70 ppb ozone level is achieved.

In 2017, the agency, after analyzing air quality data from 2014, 2015 and 2016, will determine which counties are in nonattainment with the new standard. State compliance would phase in between 2020 and 2037, with each state's specific deadline depending on its region's severity of ozone pollution.

"We are not changing the world today, but we are telling the public what we believe to be the healthy air that we're driving," McCarthy said.

The agency said the new rule would have a price tag of $1.4 billion a year, but, by 2025, would reap up to $5.9 billion in related health benefits per year.

Environmentalists and health groups, however, contended that the science put the optimal health benefits at a 60 ppb.

Sierra Club President Michael Brune called the new rule a "missed opportunity."

"The level chosen of 70 parts per billion simply does not reflect what the science shows is necessary to truly protect public health," American Lung Association President and CEO Harold Wimmer said in a statement. "Of the levels that were under consideration by the U.S. Environmental Protection Agency, an ozone limit of 60 ppb would have given Americans much greater health protections."

McCarthy, however, contended that studies pressing for 60 ppb didn't make a compelling case for such a low standard.

"While some studies have shown effects in adults at levels as low as 60 ppb, these studies do not show that these effects are harmful," she said.

Business groups, on the other hand, said that the rule, even at 70 ppb, would cause catastrophic economic damage. They argued that ozone levels have been in decline since 1980 and don't require additional mandates to push them lower.

"For months, the Administration threatened to impose on manufacturers an even harsher rule, with even more devastating consequences," National Association of Manufacturers President Jay Timmons said in a statement. "But make no mistake: the new ozone standard will inflict pain on companies that build things in America — and destroy job opportunities for American workers."

McCarthy dismissed NAM'S arguments as repetitive and dated.

"They say lots of things. Many of them are things they've said for the past 20 or 30 years," she said. "I'm not looking at what other groups are saying."

She also hit back at arguments that the new standard would plunge the nation into nonattainment, estimating that all but 14 counties outside of California had, by complying with air pollution standards already on the books, put themselves on track to reach 70 ppm by 2025.

NAM and the American Petroleum Institute also called on Congress to take action to block the new standard. Senate Environment and Public Works Chairman Sen. James Inhofe, R-Okla., said he would make it a priority.

"Our country should have been given the opportunity to fully meet the 2008 standard before implementing another frivolous and costly mandate," he said in a statement. "I will be pursuing legislation in my committee to push back on EPA and prevent red tape from continuing to run abound."

His Democratic counterpart, ranking member Sen. Barbara Boxer, D-Calif., said in a statement that the rules were a positive development, but the 70 ppb standard wasn't tough enough.

"Today's action is a step in the right direction, but I believe following the science is important, and I am disappointed that a more protective standard was not set," she said.

Feds want tougher rules for oil pipelines

By Matthew Brown

BILLINGS, Mont. (AP) — U.S. officials said Thursday they want tighter safety rules for pipelines carrying crude oil, gasoline and other hazardous liquids after a series of ruptures that included the costliest onshore oil spill in the nation's history in Michigan.

The U.S. Department of Transportation proposed expanding pipeline inspection requirements to include rural areas that are currently exempt and for companies to more closely analyze the results of their inspections.

The agency also would make companies re-check lines following floods and hurricanes, and submit information on thousands of miles of smaller lines that fall outside of existing regulations.

The Associated Press obtained details of the proposal in advance of Thursday's formal announcement. It covers more than 200,000 miles of hazardous liquids pipelines that crisscross the nation — a network that expanded rapidly over the past decade as domestic oil production increased.

Hurricane and rainstorm are locked in a dangerous dance

By Seth Borenstein

WASHINGTON (AP) — Hurricane Joaquin is locked in a dance with an extraordinarily heavy rainstorm that is already drenching the Carolinas. As the two draw closer together over the next few days, the effects could be disastrous for the East Coast.

The rainstorm is the dance partner that is leading this tango, and what it does will determine where Joaquin goes and how much of the East Coast floods. Storm No. 1 could push Joaquin out to sea or pull it into the heavily crowded Northeast.

At the same time, Joaquin is feeding the storm with moisture, contributing to its heavy rainfall.

Meteorologists are deeply uncertain about where Joaquin will go. But they warn that the record-breaking rain from storm No. 1 is a sure and scary thing, at least for an area for South Carolina to Washington, D.C.

Ex-Massey CEO Don Blankenship arrives for federal trial

By Jonathan Matisse

CHARLESTON, W.Va. (AP) — Former Massey Energy CEO Don Blankenship has arrived for the start of his federal trial on charges that he conspired to break safety laws and lied to financial regulators about safety practices.

Blankenship stepped out of a minivan that stopped in front of Charleston's federal courthouse Thursday. Wearing a suit and striped tie, Blankenship was accompanied by three homeland security officers.

As he entered the courthouse on the first day of jury selection, a reporter asked whether he was innocent of the charges. Blankenship smiled and said "yes."

The 65-year-old Blankenship faces up to three decades in prison if convicted over how he ran the Upper Big Branch Mine, which exploded in 2010, killing 29 miners.

CEO in deadliest US mine accident in 4 decades on trial

By Jonathan Matisse

CHARLESTON, W.Va. (AP) — Former Massey Energy CEO Don Blankenship hit the courtroom for a criminal trial Thursday, facing charges that he conspired to break safety laws and lied to financial regulators about safety practices at the site of the deadliest U.S. mine explosion in more than four decades.

If he's convicted, it would be a rare instance where a CEO faces prison time.

In April 2010, an underground explosion ripped through Massey's former Upper Big Branch Mine in Montcoal, West Virginia, killing 29 workers. Blankenship is attending U.S. District Court in Charleston for his jury trial.

California meets water savings target for third month

By Scott Smith

FRESNO, Calif. (AP) — Californians cut water use by 27 percent in August, marking the third consecutive month that residents and businesses surpassed the 25 percent conservation goal set by Gov. Jerry Brown to deal with the relentless drought, officials said Thursday.

The figures released by the State Water Resources Control Board showed a slight decrease in savings from the 31 percent posted for July — a development that raised concerns among some officials.

However, board chair Felicia Marcus said the slippage was not completely surprising given the heavy rains that drenched Southern California in July and prompted people to turn off sprinklers.

"The fact the numbers didn't drop precipitously shows that people get it," she said. "In a crisis people pull together and they hang in there."

US auto sales jump last month at Ford, Nissan, Fiat Chrysler

By Dee-Ann Durbin

DETROIT (AP) — Just about everything broke right for the U.S. auto industry in September, as strong consumer demand, easy credit and generous incentives combined for double-digit sales gains at most major automakers.

Right now, the scandal over emissions cheating at Volkswagen is hurting only the German automaker; VW's sales were up less than 1 percent over last September. A bigger concern for the industry in the coming months may be an impasse in contract talks between the Detroit automakers and the United Auto Workers, analysts warned.

Ford's U.S. sales grew 23 percent in September, Nissan surged 18 percent and Fiat Chrysler's U.S. sales jumped nearly 14 percent. Sales at General Motors rose 12 percent, while Toyota posted a 16 percent gain. Honda's sales were up 13 percent.

Analysts expected big sales increases because Labor Day was included in September this year versus August a year ago. Labor Day weekend is typically one of the biggest sales periods of the year, as dealers offer discounts to clear cars off their lots before the new model-year vehicles arrive.

GM warns the Valley: Prepare to compete over driverless cars

By Tom Krisher

MILFORD TOWNSHIP, Mich. (AP) — Move that tiny self-driving pod out of the way.

That might as well have been the message Thursday from General Motors to Google, Apple and anyone else with designs on dominating the market for autonomous cars.

The 107-year-old automaker told Wall Street analysts Thursday that it intends to lead no matter what form of transportation people pick in the future.

GM already has millions of cars on the road that are connected to the Internet, and it has young engineers who are helping to develop new technology that will lead to autonomous driving, said Mark Reuss, GM's product development chief.

India vows to cut carbon intensity in Paris pledge

By Karl Ritter

STOCKHOLM (AP) — As the last major economy to submit a target for a global climate pact, India is pledging to reduce the intensity of its carbon emissions and boost the share of electricity produced from sources other than fossil fuels to 40 percent by 2030.

The world's third-largest carbon polluter filed its climate action plan to the Germany-based U.N. climate secretariat late Thursday, the deadline for pledges before a December conference in Paris, where governments are supposed to adopt a landmark deal to fight climate change.

In a 38-page submission citing Mahatma Gandhi, the Indian government said it would slash the rate of emissions relative to gross domestic product by 33-35 percent by 2030 from 2005 levels.

It said India has already reduced its carbon intensity by 12 percent since 2005.

Ban: Pacific islands can help fight climate change

By The Associated Press

UNITED NATIONS (AP) — Secretary-General Ban Ki-moon says he is counting on the leaders of Pacific island nations to raise their voices and build momentum for an agreement to combat climate change.

He expressed hope that the world's nations will finalize "a new universal and meaningful climate change agreement" at a conference in Paris in December which would be "an important turning point." But he said it would not be "an end point for global climate action."

Ban said dangers to vulnerable small islands persist, citing this year's El Nino phenomenon which has caused strong droughts and cyclones in the Pacific.

He told a meeting of the Pacific Islands Forum on the sidelines of the U.N. General Assembly ministerial meeting that he has been doing everything possible to raise the financing they need to mitigate climate change.

As oil wealth dwindles, Saudi Arabia faces change

By Aya Batrawy

JIDDAH, Saudi Arabia (AP) — At a gas station in Saudi Arabia's second largest city of Jiddah, drivers are fueling up their cars at just 45 cents a gallon — four times less than the price of water.

To make that possible, the kingdom spends up to $10.7 billion per year on gasoline subsidies. It also offers a range of perks and welfare support to its citizens such as free healthcare and education, including thousands of scholarships to expensive Western universities.

Such largesse, however, is likely to be rolled back as the world's largest oil exporter looks to curb spending for the first time in years due to a plunge in the price of crude, which accounts for 90 percent of government revenue.

While the country's $656 billion in currency reserves will help it avoid a brutal shift in lifestyles and policies, the kingdom is starting to be more careful with its finances. That will likely mean less investment in new infrastructure projects but also possibly, down the line, less welfare spending, smaller wage increases, and less construction of much-needed housing and roads.

Ford scores biggest gain since 2010

Ford Motor Co. achieved its largest year-over-year U.S. sales increase in almost five years, posting a 23 percent gain for September. Sales of Ford F-series pickups rose 16 percent, and deliveries of three Ford crossovers -- the Escape, Edge and Explorer -- jumped more than 30 percent each. Mustang sales tripled in September and are now up 61 percent on the year.

Toyota rises 16 percent, seeks more truck output

Toyota Motor Sales posted a 16 percent year-over-year U.S. sales increase last month that resulted in its best September since 2007.

GM rides crossover, retail volume to 13% advance

GM's U.S. sales rose 13 percent in September on strong crossover demand and a 17 percent rise in retail deliveries.

Rogue passes Altima to lift Nissan 17%

The Nissan brand posted record September U.S. sales, thanks to

volume for the Versa subcompact.

[redacted]

Volkswagen of America finished a scandal-ridden month with roughly flat U.S. sales, defying forecasts that a mid-month halt to diesel vehicle sales and a black eye to its brand image would hammer its September results.

Subject: Meeting Request from German Minister of Transportation Minister Dobrindt -- October 27
Importance: High

All – Per the attached, the German Embassy has just requested a meeting with the Administrator on Tuesday, October 27th for German Minister of Transport and Digital Infrastructure Alexander Dobrindt to discuss the VW issue.

I am copying OTAQ directly to get their immediate feedback and would defer to their judgement but my initial reaction is that it would be appropriate to offer a meeting with EPA senior leadership, if not with the Administrator.

Mark/Martin, please share this with Jane to get her input on how to proceed with this request.

Many thanks…

Anna

Subject: Minister Dobrindt

Dear Anna,

Thanks for arranging the meetings for Christian Hey yesterday. I thought the discussions with your colleagues working on TTIP were particularly interesting. I am afraid I didn't catch Danielle's last name. Can you send me her details?

As promised, regarding the visit of Alexander Dobrindt, German Federal Minister of Transport and Digital Infrastructure: Minister Dorbindt will be in DC October 27 and would very much like to meet Administrator Gina McCarthy and her staff working on the Volkswagen case.

Thanks for your help once again and I hope you are going to have a nice hurricane-free time on

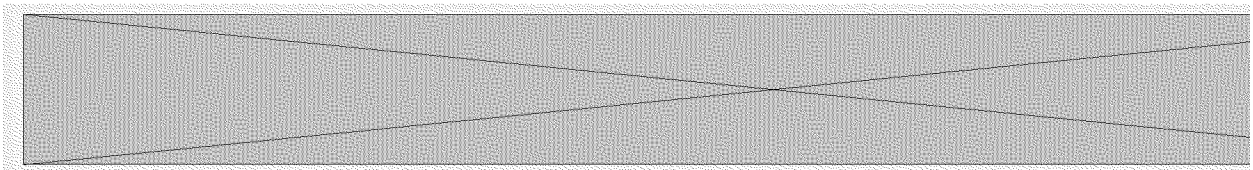
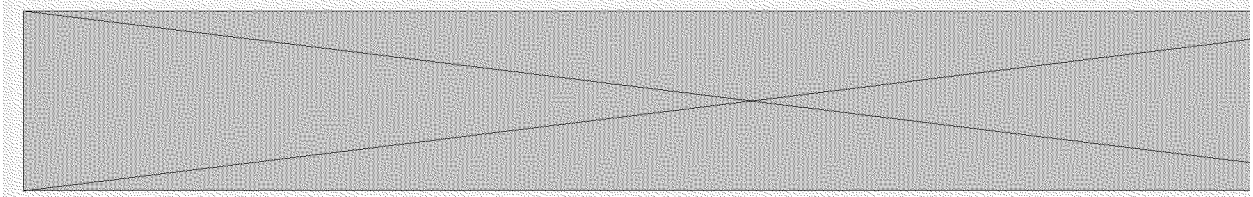
Subject: Overnight Energy & Environment: EPA ozone rule takes hits from all sides





WELCOME TO THE OZONE: Federal regulators formally introduced their strong new standard for ozone levels on Thursday, setting up a fight with Congress, industry and environmentalists alike.

Cutting oil & gas methane makes cents. It creates quality manufacturing and service jobs, boosts America's small businesses and saves $1.2 billion in energy waste. Learn more www.EDF.org/methane

SPONSOR-GENERATED CONTENT

The Environmental Protection Agency's new standard -- 70 parts per billion -- is tighter than the 75 parts per billion standard currently on the books.

Industry groups have warned against the prospect of any new ozone standard, saying it will be exceedingly expensive to implement. Environmental and health groups pushed the EPA to set an even tougher standard, calling it a public health necessity.

So on Thursday, both sides hit regulators for the new standard.

"The new ozone standard will inflict pain on companies that build things in America -- and destroy job opportunities for American workers," National Association of Manufacturers President Jay Timmons said.

"The level chosen ... simply does not reflect what the science shows is necessary to truly protect public health," Harold Wimmer, the president of the American Lung Association, said.

EPA administrator Gina McCarthy defended the rule as both attainable and a win for public

health.

"This strengthened standard will improve public health protection across the country and provide the adequate margin of safety that is required by law and that the science supports," McCarthy told reporters.

Read more here.

REPUBLICANS VOW TO FIGHT RULE: Republicans on Capitol Hill bashed the new ozone rule on Thursday with some hinting at a legislative response to the release.

"EPA's decision to restrict the ozone standard to 70 parts per billion is yet another example of the Obama administration's enthusiasm for needless regulation," Sen. Jim Inhofe (R-Okla.) said in a statement.

"Our country should have been given the opportunity to fully meet the 2008 standard before implementing another frivolous and costly mandate."

Inhofe chairs the Senate Environment and Public Works Committee, and he said he "will be pursuing legislation" to respond to the rule.

House chairmen, including Reps. Lamar Smith (R-Texas) of the Science Committee and Fred Upton (R-Mich.) of the Energy and Committee, also hit the new rule, which they said could be the most expensive regulation ever to implement.

"Our economy is teetering as wild fluctuations have defined a volatile global market," Upton said in a statement with Rep. Ed Whitfield (R-Ky.).

"And the administration's response? Pushing forward with what many experts predict will be the EPA's costliest regulation in history and could very well be a last straw for our fragile economy."

Read more here.

NEWS BITE:

Supporters of lifting the crude oil ban are hitting the airwaves to make their case.

Producers for American Crude Oil Exports is releasing an ad in 15 congressional districts around the country to plug a bill ending the 40-year-old ban ahead of a House vote on the measure expected for next week.

The ads tie new crude exports to the prospect of Iranian oil hitting the market after sanctions on the country are lifted.

"The crude oil export ban not only puts U.S. companies at a significant competitive

disadvantage, but threatens our national security interests," PACE executive director George Baker said.

"Permanently repealing the ban would provide our global allies with a stable and secure supply of oil, while creating and protecting jobs here at home and putting downward pressure on U.S. gasoline prices."

Hi folks,

I know we have a full kid so consider this one for tomorrow morning.

I did ask Whoriskey about whatever his new deadline is. I'll let you know as soon as he tells is. My guess is it will go for Sun or Mon.

Thanks to both of you for setting up the phone call today. I've confirmed those bits about how the infractions in the 95, 97 and 98 consent decrees arose, and what role the ROVER had in their detection. The accounts on both sides are pretty close.

There are just a few outstanding issues arising from the phone call that I would like to remind you of:

- It would be nice to get a better account of why the Virginia Testing Laboratory was closed. Saying only that it was "contracting issues" only leads to more questions.

- Chris Grundler said you all might get me the figures on the NVFEL budget, and how it has been expanded since 2001.

- Finally, I would like to verify that the EPA's regular road testing of cars for emissions compliance did not continue after the closure of the Virginia Testing Laboratory, where Emmet Arndt had been running a pilot program to do so. Chris Grundler indicated that the regular road testing of cars for emissions compliance hadn't continued after the closure,

indicating that it wasn't continued because the priorities led them to focus on heavy duty engines, where a larger portion of the pollution comes from. Byron Bunker may have been saying something different, though, so I want to make sure I've understood correctly.

Best,

Peter

Thanks to both of you for setting up the phone call today. I've confirmed those bits about how the infractions in the 95, 97 and 98 consent decrees arose, and what role the ROVER had in their detection. The accounts on both sides are pretty close.

There are just a few outstanding issues arising from the phone call that I would like to remind you of:

- It would be nice to get a better account of why the Virginia Testing Laboratory was closed. Saying only that it was "contracting issues" only leads to more questions.

- Chris Grundler said you all might get me the figures on the NVFEL budget, and how it has been expanded since 2001.

- Finally, I would like to verify that the EPA's regular road testing of cars for emissions compliance did not continue after the closure of the Virginia Testing Laboratory, where Emmet Arndt had been running a pilot program to do so. Chris Grundler indicated that the regular road testing of cars for emissions compliance hadn't continued after the closure, indicating that it wasn't continued because the priorities led them to focus on heavy duty engines, where a larger portion of the pollution comes from. Byron Bunker may have been saying something different, though, so I want to make sure I've understood correctly.

Best,

Peter

Subject: Re: REQUEST EPA COMPLIANT CAR

This is a letter to the editor that I wrote which was printed in the Press Democrat, Santa Rosa, CA. on Oct. 1, 2016.

My ride

EDITOR: I own a 2012 Volkswagen Jetta. I have felt mad and sad since I heard the news. I'm thinking about changing my license plate to "NOXIOUS."

As often happens when I make a purchase, I am torn: organic or not? Drive often or consolidate trips, pollute more or pollute less? Slave-labor purchase or Fair trade? Even when I make a p.c. purchase, I wonder what do they mean by "organic," or by "natural"? What wage was paid for this article of clothing? Under what conditions was it made? What about jet trips or water usage? Please, don't get me started about food industry standards, Monsanto, GMOs.

VW cheated and lied to its dealers and the public. Its "clean diesels" are like "clean coal," non-existent. My car pollutes in unacceptable amounts by EPA standards. What happened is wrong, and I want it fixed. Some owners don't care for the trade-off, a fix may reduce performance.

VW cheated to entice consumers with exactly what we want. Honestly, my car is one of many purchases that I have made that weren't the most healthy choice for me or for you or for the planet. I did want it to be true, that I could have my cake and eat it, too.

ANN KRINARD

Sebastopol

RE: This earlier correspondence: "TRADE-IN of 2012 VW Jetta Sportwagen Diesel with compromised emissions" of 5 days ago.

Hello again:

I appreciate the recorded phone message left today from the Executive Offices of VW of America.

I will look forward to hearing from you again soon as you stated in your message.

Thank you for making contact with me. Ann Krinard

Sept. 27, 2016

Hello to All Concerned:

First of All, I love my car. I'm sorry that VW has compromised my trust. I have owned many VW's over my life and I want to own one that does not spew as many toxins as my current car.

We purchased a "Clean Diesel" VW Jetta Sportwagen Diesel 2012 new.Current mileage 25,690 approximately. A 2015 scandal determined that car does not meet EPA standards for Nox emissions.

Request trade-in for VW Golf SportWagen with AdBlue System to resolve this situation.
I am a conscientious person who does not want to do more harm to the environment by continuing to drive my car. This is a simple solution to keep more emissions out of our air.

Thank you for your time and consideration.

Ann

Congress, greens step up pressure for Volkswagen probe

By Kevin Rogers

Congress and environmentalists are pressing for a strong response to Volkswagen's alleged use of technology to evade Clean Air Act emissions tests. A House subcommittee has called the company's U.S. chief to testify at a hearing, and the Center for Biological Diversity is seeking overhauled vehicle testing and tougher penalties for violations.

An Environmental Protection Agency investigation alleged that Volkswagen used "defeat

devices" in its diesel-powered vehicles to evade emissions standards. The technology allegedly activated emissions controls during testing, but in driving scenarios, the vehicles would emit up to 40 times the legal amount of nitrogen oxide, EPA said.

The scandal drove CEO Martin Winterkorn to resign last week, and the company said it would work to repair the issue in some 11 million vehicles worldwide.

The House Energy and Commerce Subcommittee on Oversight and Investigations has scheduled a hearing on the issue next Thursday. Volkswagen Group of America President and CEO Michael Horn and EPA officials are set to testify.

Energy and Commerce Chairman Rep. Fred Upton, R-Mich., said the hearing would seek to "get to the bottom" of the allegations and pledged to hold Volkswagen accountable.

"The very notion of a carmaker intentionally violating our environmental laws is beyond belief," he said in a statement. "But reports of Volkswagen selling cars with devices aimed at skirting the law cannot, and will not be tolerated. Attempting to deceive regulators and customers is a double whammy of betrayal."

Subcommittee Chairman Rep. Tim Murphy, R-Pa., said the hearing would also examine how the devices were able to go undetected. EPA's investigation involved vehicles sold between 2009 and 2015.

"The American people want to know why these devices were in place, how the decision was made to install them, and how they went undetected for so long. We will get them those answers," he said.

Separately, the Center for Biological Diversity called on EPA to prevent future abuses through stronger regulations. In a legal petition filed Thursday to the agency and the National Highway Traffic Safety Administration, the group called for the agencies to overhaul pollution controls and raise penalties for companies that don't meet fuel economy standards.

"Lax EPA testing let Volkswagen cheat car buyers and pollute our air for years without getting caught," staff attorney Kristen Monsell said. "VW's appalling actions show why the EPA must require on-road tests to catch car company cheats. Tougher tests will fight fraud and protect our health and climate from dangerous pollutants spewed by these cars."

The Center for Biological Diversity wants EPA to conduct in-use emissions testing of existing motor vehicles, be they diesel or gasoline-powered. The group also urged EPA to develop regulations to require in-use testing for all new vehicle models.

The center also called on NHTSA to boost penalties for vehicles that don't meet Corporate Average Fuel Economy standards. The law currently fines manufacturers $5.50 per vehicle sold for every 0.1 mile-violation. The petition asks that the fee be raised to $10.

"The recent scandal highlights yet another industry-wide problem — that car manufacturers routinely pay fines, rather than comply with mandatory fuel economy standards that seek to improve fuel efficiency and reduce carbon dioxide emissions," the petition said. "As we have frequently pointed out, and as government reports indicate, the meager fines are too low to act as a deterrent."

EPA said it was reviewing the petition and would respond as necessary. The agency last week said told U.S. automakers that it would begin requiring in-use emissions testing in an effort to track down other defeat devices.

Senate panel votes to lift 40-year-old US ban on oil exports

By Matthew Daly

WASHINGTON (AP) — The Senate Banking Committee endorsed a bill Thursday to lift the four-decade-old ban on crude oil exports, the latest sign of congressional support for legislation that President Barack Obama opposes.

The banking panel endorsed the bill, 13-9, on a largely party-line vote. Sen. Heidi Heitkamp of North Dakota sponsored the bill and was the only Democrat to support it.

Heitkamp said the bill would lower or stabilize gas prices, support jobs and increase U.S. influence abroad.

Despite the largely partisan committee vote, Heitkamp said she is optimistic that some Senate Democrats will support efforts to lift the export ban, which was imposed in the 1970s amid an energy shortage. Heitkamp's bill is expected to be merged with larger legislation sponsored by Sen. Lisa Murkowski, R-Alaska, before a vote in the full Senate.

US pipeline agency fines Exxon subsidiary $2.6 million

By Claudia Lauer

LITTLE ROCK, Ark. (AP) — Federal regulators announced Thursday they are assessing a $2.6 million civil penalty against ExxonMobil Pipeline Co. for a 2013 oil spill in Arkansas.

The Pipeline and Hazardous Materials Safety Administration released its final report on the Pegasus pipeline leak that spilled roughly 3,190 barrels of oil near Mayflower and Lake Conway about 20 miles north of Little Rock in March 2013. The agency, which is under the U.S. Department of Transportation, said in its order that the company violated regulations involving the line's integrity, operation and maintenance.

The U.S. Department of Transportation agency's spokeswoman Artealia Gilliard wrote in an email that "time intensified defects of originally manufactured pipe" led to the rupture in the pipeline in 2013. She said an investigation of the leak found the violations.

The northern portion of the pipeline, which runs through Mayflower, remains closed. The agency granted a request to return the southern segment of the line to partial service with reduced pressure in July 2014.

More

Feds: Proposed pipeline rules could have prevented accidents

By Matthew Brown

BILLINGS, Mont. (AP) — New federal rules proposed for pipelines that carry oil and other hazardous liquids could have prevented more than 200 accidents since 2010, including a Michigan rupture that ranks as the costliest onshore spill in U.S. history, federal officials said.

The U.S. Transportation Department proposal announced Thursday covers more than 200,000 miles of hazardous liquids pipelines that crisscross the nation — a network that expanded rapidly over the past decade as domestic oil production increased.

Included in the proposal are new inspection requirements for pipelines in rural areas; increased use of leak detection systems; and a requirement for companies to more closely analyze inspection results.

Left out were requirements for the industry to install more automatic or remote-controlled valves that can quickly shut down a line when spills occur.

More

EPA missed its best chance to catch VW cheating

By Jason Keyser

CHICAGO (AP) — More than a decade ago, the Environmental Protection Agency helped develop a technology that ultimately was used by an independent laboratory to catch Volkswagen's elaborate cheating on car emissions tests. But EPA used the technology primarily to test trucks rather than passenger cars because such heavy equipment was a much bigger polluter.

That decision meant that the regulator missed its best chance to foil the German carmaker's deception early on. The portable emissions measurement systems that EPA pioneered might have subjected VW diesel cars to on-road tests and discovered they were spewing up to 40 times the allowable levels of key pollutant nitrogen oxide under normal driving conditions.

Without that test, VW was virtually home free and evaded detection for seven years.

"If EPA had used the technology back then (on diesel cars), we could have caught it," said Margo Oge, who was director of the EPA's office of Transportation and Air Quality at the time and headed the office for 18 years until 2012. But she doesn't regret EPA's decision to focus that technology on manufacturers of trucks and heavy equipment, which had a record of cheating on tests and accounted for a much bigger portion of U.S. pollution than the nascent diesel car business.

More

California to conduct its own Volkswagen investigation

By Don Thompson

SACRAMENTO, Calif. (AP) — California is dropping out of a multistate investigation to conduct its own probe into Volkswagen's admission that it rigged diesel emissions technology to pass U.S. smog tests.

An official with the state's Department of Justice said Thursday that California is no longer participating in the investigation by more than two dozen attorneys general.

The person, who spoke on condition of anonymity because of the ongoing investigation, said reasons for the decision to go it alone include California having the nation's strongest environmental laws.

The person would not say if subpoenas have been issued or are planned.

Hawaii, EPA and Navy agree to plan to address tank

leaks

By Audrey McAvoy

HONOLULU (AP) — The U.S. Environmental Protection Agency and Hawaii state Department of Health on Thursday said they finalized a deal with the Navy to better prevent and detect leaks from 20 giant fuel storage tanks near Pearl Harbor.

The 70-year-old underground tanks are built into the side of a mountain atop a large aquifer critical to Honolulu's water supply. The tanks provide fuel to U.S. military ships and aircraft, serving as a strategically important "gas stop" between the U.S. West Coast and the western Pacific.

The agencies began working on plans to address leaks after the Navy detected a leak of 27,000 gallons of fuel from one tank last year. Samples from nearby water-monitoring wells showed a spike in hydrocarbons, indicating possible fuel contamination.

The agreement calls for studying options for upgrading the tanks and then fixing them over the next 20 years. Tanks not upgraded will be taken out of service. The upgrades are expected to cost tens of millions of dollars.

India ties carbon pledge to environmentalist Gandhi

By Karl Ritter and Katy Daigle

NEW DELHI (AP) — India submitted its climate pledge to the United Nations Thursday, the last major economy to do so, citing an intended link to prominent historical environmental figure Mohandas K. Gandhi.

Environment Minister Prakash Javadekar said India held its submission back so it could coordinate its filing with the Indian holiday celebrating Gandhi's birthday on Friday.

"Our every action will be cleaner than what it was earlier," Javadekar told reporters, insisting that Indian traditions and culture are already "at one with nature."

India is pledging to reduce the intensity of its carbon emissions and boost the share of electricity produced from sources other than fossil fuels to 40 percent by 2030.

Thanks to both of you for setting up the phone call today. I've confirmed those bits about how the infractions in the 95, 97 and 98 consent decrees arose, and what role the ROVER had in their detection. The accounts on both sides are pretty close.

There are just a few outstanding issues arising from the phone call that I would like to remind you of:

- It would be nice to get a better account of why the Virginia Testing Laboratory was closed. Saying only that it was "contracting issues" only leads to more questions.

- Chris Grundler said you all might get me the figures on the NVFEL budget, and how it has been expanded since 2001.

- Finally, I would like to verify that the EPA's regular road testing of cars for emissions compliance did not continue after the closure of the Virginia Testing Laboratory, where Emmet Arndt had been running a pilot program to do so. Chris Grundler indicated that the regular road testing of cars for emissions compliance hadn't continued after the closure, indicating that it wasn't continued because the priorities led them to focus on heavy duty engines, where a larger portion of the pollution comes from. Byron Bunker may have been saying something different, though, so I want to make sure I've understood correctly.

Best,

Peter

Congress, greens step up pressure for Volkswagen probe

By Kevin Rogers

Congress and environmentalists are pressing for a strong response to Volkswagen's alleged use of technology to evade Clean Air Act emissions tests. A House subcommittee has called the company's U.S. chief to testify at a hearing, and the Center for Biological Diversity is seeking overhauled vehicle testing and tougher penalties for violations.

An Environmental Protection Agency investigation alleged that Volkswagen used "defeat devices" in its diesel-powered vehicles to evade emissions standards. The technology allegedly activated emissions controls during testing, but in driving scenarios, the vehicles would emit up to 40 times the legal amount of nitrogen oxide, EPA said.

The scandal drove CEO Martin Winterkorn to resign last week, and the company said it would work to repair the issue in some 11 million vehicles worldwide

The House Energy and Commerce Subcommittee on Oversight and Investigations has scheduled a hearing on the issue next Thursday. Volkswagen Group of America President and CEO Michael Horn and EPA officials are set to testify.

Energy and Commerce Chairman Rep. Fred Upton, R-Mich., said the hearing would seek to "get to the bottom" of the allegations and pledged to hold Volkswagen accountable.

"The very notion of a carmaker intentionally violating our environmental laws is beyond belief," he said in a statement. "But reports of Volkswagen selling cars with devices aimed at skirting the law cannot, and will not be tolerated. Attempting to deceive regulators and customers is a double whammy of betrayal."

Subcommittee Chairman Rep. Tim Murphy, R-Pa., said the hearing would also examine how the devices were able to go undetected. EPA's investigation involved vehicles sold between 2009 and 2015.

"The American people want to know why these devices were in place, how the decision was made to install them, and how they went undetected for so long. We will get them those answers," he said.

Separately, the Center for Biological Diversity called on EPA to prevent future abuses through stronger regulations. In a legal petition filed Thursday to the

agency and the National Highway Traffic Safety Administration, the group called for the agencies to overhaul pollution controls and raise penalties for companies that don't meet fuel economy standards.

“Lax EPA testing let Volkswagen cheat car buyers and pollute our air for years without getting caught,” staff attorney Kristen Monsell said. “VW’s appalling actions show why the EPA must require on-road tests to catch car company cheats. Tougher tests will fight fraud and protect our health and climate from dangerous pollutants spewed by these cars.”

The Center for Biological Diversity wants EPA to conduct in-use emissions testing of existing motor vehicles, be they diesel or gasoline-powered. The group also urged EPA to develop regulations to require in-use testing for all new vehicle models.

The center also called on NHTSA to boost penalties for vehicles that don't meet Corporate Average Fuel Economy standards. The law currently fines manufacturers $5.50 per vehicle sold for every 0.1 mile violation. The petition asks that the fee be raised to $10.

“The recent scandal highlights yet another industry-wide problem — that car manufacturers routinely pay fines, rather than comply with mandatory fuel economy standards that seek to improve fuel efficiency and reduce carbon dioxide emissions,” the petition said. “As we have frequently pointed out, and as government reports indicate, the meager fines are too low to act as a deterrent.”

EPA said it was reviewing the petition and would respond as necessary. The agency last week said told U.S. automakers that it would begin requiring in-use emissions testing in an effort to track down other defeat devices.

Senate panel votes to lift 40-year-old US ban on oil exports

By Matthew Daly

WASHINGTON (AP) — The Senate Banking Committee endorsed a bill Thursday to lift the four-decade-old ban on crude oil exports, the latest sign of congressional support for legislation that President Barack Obama opposes.

The banking panel endorsed the bill, 13-9, on a largely party-line vote. Sen. Heidi Heitkamp of North Dakota sponsored the bill and was the only Democrat to support it.

Heitkamp said the bill would lower or stabilize gas prices, support jobs and increase U.S. influence abroad.

Despite the largely partisan committee vote, Heitkamp said she is optimistic that

some Senate Democrats will support efforts to lift the export ban, which was imposed in the 1970s amid an energy shortage. Heitkamp's bill is expected to be merged with larger legislation sponsored by Sen. Lisa Murkowski, R-Alaska, before a vote in the full Senate.

US pipeline agency fines Exxon subsidiary $2.6 million

By Claudia Lauer

LITTLE ROCK, Ark. (AP) — Federal regulators announced Thursday they are assessing a $2.6 million civil penalty against ExxonMobil Pipeline Co. for a 2013 oil spill in Arkansas.

The Pipeline and Hazardous Materials Safety Administration released its final report on the Pegasus pipeline leak that spilled roughly 3,190 barrels of oil near Mayflower and Lake Conway about 20 miles north of Little Rock in March 2013. The agency, which is under the U.S. Department of Transportation, said in its order that the company violated regulations involving the line's integrity, operation and maintenance.

The U.S. Department of Transportation agency's spokeswoman Artealia Gilliard wrote in an email that "time intensified defects of originally manufactured pipe" led to the rupture in the pipeline in 2013. She said an investigation of the leak found the violations.

The northern portion of the pipeline, which runs through Mayflower, remains closed. The agency granted a request to return the southern segment of the line to partial service with reduced pressure in July 2014.

Feds: Proposed pipeline rules could have prevented accidents

By Matthew Brown

BILLINGS, Mont. (AP) — New federal rules proposed for pipelines that carry oil and other hazardous liquids could have prevented more than 200 accidents since 2010, including a Michigan rupture that ranks as the costliest onshore spill in U.S. history, federal officials said.

The U.S. Transportation Department proposal announced Thursday covers more than 200,000 miles of hazardous liquids pipelines that crisscross the nation — a network that expanded rapidly over the past decade as domestic oil production increased.

Included in the proposal are new inspection requirements for pipelines in rural areas; increased use of leak detection systems; and a requirement for companies to more closely analyze inspection results.

Left out were requirements for the industry to install more automatic or remote-controlled valves that can quickly shut down a line when spills occur.

EPA missed its best chance to catch VW cheating

By Jason Keyser

CHICAGO (AP) — More than a decade ago, the Environmental Protection Agency helped develop a technology that ultimately was used by an independent laboratory to catch Volkswagen's elaborate cheating on car emissions tests. But EPA used the technology primarily to test trucks rather than passenger cars because such heavy equipment was a much bigger polluter.

That decision meant that the regulator missed its best chance to foil the German carmaker's deception early on. The portable emissions measurement systems that EPA pioneered might have subjected VW diesel cars to on-road tests and discovered they were spewing up to 40 times the allowable levels of key pollutant nitrogen oxide under normal driving conditions.

Without that test, VW was virtually home free and evaded detection for seven years.

"If EPA had used the technology back then (on diesel cars), we could have caught it," said Margo Oge, who was director of the EPA's office of Transportation and Air Quality at the time and headed the office for 18 years until 2012. But she doesn't regret EPA's decision to focus that technology on manufacturers of trucks and heavy equipment, which had a record of cheating on tests and accounted for a much bigger portion of U.S. pollution than the nascent diesel car business.

California to conduct its own Volkswagen investigation

Trouble seeing this email? Click here.

By Don Thompson

SACRAMENTO, Calif. (AP) — California is dropping out of a multistate investigation to conduct its own probe into Volkswagen's admission that it rigged diesel emissions technology to pass U.S. smog tests.

An official with the state's Department of Justice said Thursday that California is no longer participating in the investigation by more than two dozen attorneys general.

The person, who spoke on condition of anonymity because of the ongoing investigation, said reasons for the decision to go it alone include California having the nation's strongest environmental laws.

The person would not say if subpoenas have been issued or are planned.

A message from the American Petroleum Institute

America is now the world's #1 natural gas producer and will soon be #1 in oil. Now more than ever, abundant energy means abundant prosperity, opportunity and security for all Americans.

Hawaii, EPA and Navy agree to plan to address tank leaks

By Audrey McAvoy

HONOLULU (AP) — The U.S. Environmental Protection Agency and Hawaii state Department of Health on Thursday said they finalized a deal with the Navy to better prevent and detect leaks from 20 giant fuel storage tanks near Pearl Harbor.

The 70-year-old underground tanks are built into the side of a mountain atop a large aquifer critical to Honolulu's water supply. The tanks provide fuel to U.S. military ships and aircraft, serving as a strategically important "gas stop" between the U.S. West Coast and the western Pacific.

The agencies began working on plans to address leaks after the Navy detected a leak of 27,000 gallons of fuel from one tank last year. Samples from nearby water monitoring wells showed a spike in hydrocarbons, indicating possible fuel

contamination.

The agreement calls for studying options for upgrading the tanks and then fixing them over the next 20 years. Tanks not upgraded will be taken out of service. The upgrades are expected to cost tens of millions of dollars.

India ties carbon pledge to environmentalist Gandhi

By Karl Ritter and Katy Daigle

NEW DELHI (AP) — India submitted its climate pledge to the United Nations Thursday, the last major economy to do so, citing an intended link to prominent historical environmental figure Mohandas K. Gandhi.

Environment Minister Prakash Javadekar said India held its submission back so it could coordinate its filing with the Indian holiday celebrating Gandhi's birthday on Friday.

"Our every action will be cleaner than what it was earlier," Javadekar told reporters, insisting that Indian traditions and culture are already "at one with nature."

India is pledging to reduce the intensity of its carbon emissions and boost the share of electricity produced from sources other than fossil fuels to 40 percent by 2030.

US continues to widen lead as world's top natural gas producer

The United States continues to widen its lead as the world's largest natural gas producer, a remarkable surge from a decade ago when worries abounded that Americans might need to import the product to meet growing demand, Platts reports.

Russian oil output hits record in September

Russia was producing an average of 10.74 million barrels of oil a day in September, a level not seen since the fall of the Soviet Union, The Wall Street Journal reports.

Only regulated markets to see new nuke plants: Southern's Fanning

Southern Company chief Tom Fanning says major companies operating in regulated markets are the only ones with the wherewithal to build new nuclear power plants, Platts reports.

NJ lawmakers press Christie on offshore wind

Three of New Jersey's Democratic lawmakers – Sens. Robert Menendez and Cory Booker, alongside Rep. Frank Pallone – have written to the state's Republican Gov. Chris Christie, urging him to get moving to implement the state's law to promote offshore wind programs, NJ Spotlight reports.

Jury selection underway in coal exec conspiracy trial

The judge in the conspiracy trial of former Massey Energy Co. chief Don Blankenship, facing charges over the deadly Upper Big Branch mine disaster, kept observers from listening to the hours of jury selection on the opening day, the Charleston Gazette-Mail reports.

Volatile oil swings higher on Syria fears

Oil prices were rebounding early Friday on concerns about Russia's growing involvement in the Syrian conflict. U.S. benchmark crude rose 74 cents to $45.48 a barrel in electronic trading on the Nymex, while in London Brent increased 47 cents to $48.16, Reuters reports.

Incentives boosting solar industry in New Hampshire

Many New Hampshire residents are installing home solar systems, encouraged by a state rebate program that ends next year, WMUR reports.

Glencore chief trying to shore up faltering miner

Glencore CEO Ivan Glasenberg has been pressing hard to restore confidence in

the debt-ridden mining giant that has lost 83 percent of its value since going public four years ago, The Wall Street Journal reports.

Renewable push 'matter of survival' for Marshall Islands

The small Pacific nation of the Marshall Islands made a change to generate a lot of its power from solar energy after an oil price spike in 2008 and is planning a further shift to renewbles, a move the foreign minister is calling "a matter of survival" for the low-lying country, Reuters reports.

Statoil working with students to cut carbon

Norwegian oil giant Statoil is spending nearly $6 million on a project – in conjunction with the Norwegian University of Science and Technology – to work toward new energy solutions for a low-carbon economy, UPI reports.

Student behavior impeding UC Davis energy goals

Developer Carmel Partners is considering charging students for electricity on top of their rent in West Village at the University of California Davis, in order to help the project achieve its zero-net energy goals, The Saramento Bee reports.

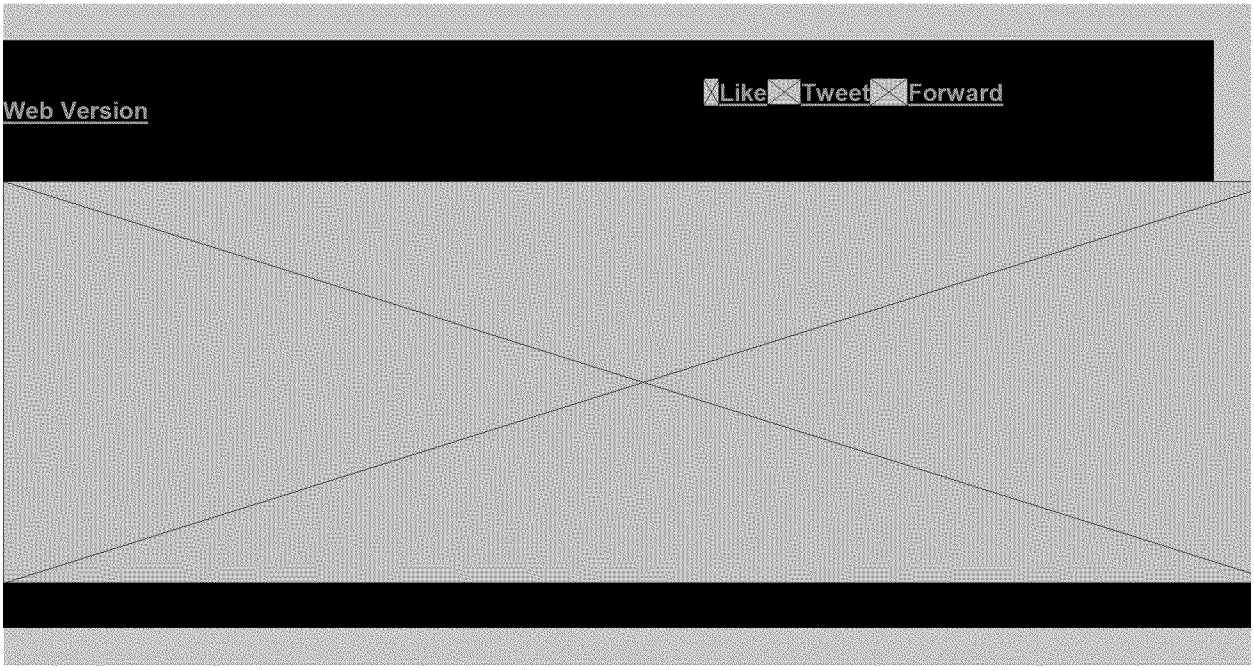
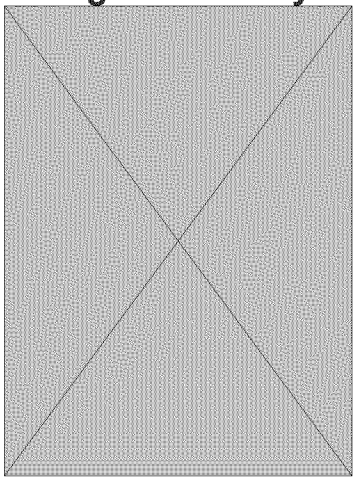
Subject: What impact will VW defeat device revelations have on diesel engine industry?



VW defeat device revelations impact entire diesel engine industry



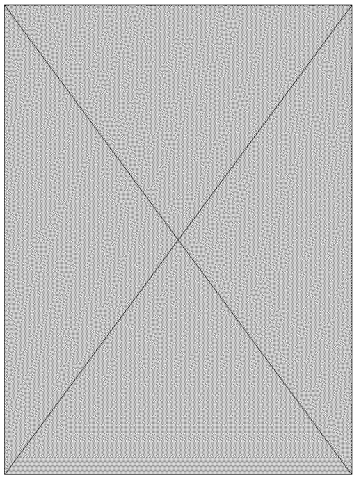
The Volkswagen emissions defeat device disclosure threatens to bring diesel on- and off-highway vehicles and machinery under an unprecedented level of scrutiny.

The admission by Volkswagen that their 2.0 litre TDI turbo-diesel engine vehicles were fitted with a cheat device embedded in the software code has created a scandal that has already forced other car manufacturers to deny utilising similar cheat devices.

However, the detrimental impact could be far greater than just passenger cars , with questions likely to be asked about the performance of both *heavy-duty vehicles* and *off-highway machinery*.

Read more insight into the VW revelations here >>>

Integer Emissions Summit USA to examine impact of the scandal



The *8th Integer Emissions Summit & DEF Forum USA 2015*, taking place on the 27-29 October, is extremely timely as it will bring together over 400 senior executives from across the emissions control supply chain to examine the fallout from the defeat device scandal and the implications for the wider diesel engine industry.

- Will the Volkswagen defeat device scandal result in a stricter certification testing process for vehicles and machinery?
- Will public opinion drive a shift away from diesel powered vehicles and machinery to alternative fuel and hybrid vehicles?
- Will the removal of the defeat device drive an increase in DEF demand and consumption?

The conference is North America's leading independent information and networking forum and will analyse the fallout from the VW crisis and the wider emissions control challenges for the on- and off-highway, marine vessels and DEF markets.

Register today to guarantee your place.

Two simple ways to register:

- Register **online**

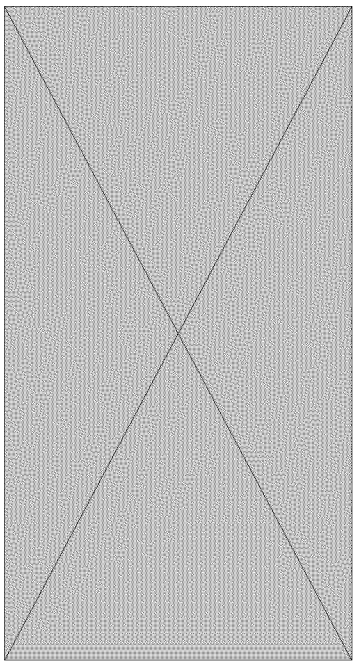
NEW: Expert Briefing – The VW diesel emissions crisis

The demand for accurate information regarding the VW crisis is getting more urgent. The emissions analysts at Integer Research have reacted swiftly to produce an '*Expert Briefing: The VW diesel emissions crisis*', which provides essential insights into the situation.

This publication covers emissions and fuel economy regulations, real world driving vs regulatory limits, the VW market including VW sales, market shares, a sales breakdown and the potential whereabouts of the other 11 million vehicles fitted with the EA189 engine. In the wake of the VW scandal (and some of the incorrect information being published about it), this expert briefing is a vital tool for those that need an accurate account of what happened at VW, and the likely impact it will have on VW, it's suppliers, manufacturers and customers.



For more information or to purchase *Expert Briefing: The VW diesel emissions crisis*, visit **www.integer-research.com/market-analysis/vw-diesel-emissions-crisis**.

If you have any questions on +44 (0) 7503 1265 or wish to access the publications, email **publications@integer-research.com**

Subject: Financial Times: EPA extends VW diesel emissions probe to other brands in US

Financial Times:

http://www.ft.com/intl/cms/s/0/9e4a32fa-68d6-11e5-97d0-1456a776a4f5.html#axzz3nPzzcwZI

EPA extends VW diesel emissions probe to other brands in US

Barney Jopson in Washington and Robert Wright in New York

The widened tests are aimed at establishing if VW was alone in using the defeat devices

More than two dozen diesel car models made by BMW, Chrysler, General Motors, Land Rover and Mercedes-Benz are under scrutiny as the US regulator that exposed Volkswagen's rigging of emissions tests probes whether rival carmakers engaged in similar cheating.

The Environmental Protection Agency's broadening search for software-based "defeat devices" that understate emissions during laboratory tests will encompass at least 28 diesel-powered models, according to a document seen by the Financial Times.

More

The investigations are aimed at determining whether the German carmaker was alone in rigging emissions tests or if the practice is more widespread in the industry. VW has admitted that the devices, which turn on pollution controls during lab tests, had been fitted to up to 11m vehicles worldwide, leading to the resignation of Martin Winterkorn, its chief executive.

The EPA will initially test one used vehicle of each model and then widen the probe if it uncovers anything suspicious, said a senior agency official close to the investigation.

The news about the EPA's expanded investigation comes as Italy's antitrust authority announced it had opened an inquiry into VW to establish whether customers' car purchases were distorted by the German carmaker's emissions claims.

The competition watchdog for the eurozone's third-largest economy said in a statement that the investigation was related to models sold by VW between 2009 and 2015 with the brands Volkswagen, Audi, Seat and Skoda. The authority said it wanted to know whether VW engaged in "improper commercial practices" in selling cars and commercial vehicles that had emissions standards "below the declared values".

The US watchdog is using cars from rental agencies or borrowing them from owners it identifies via vehicle registration databases. To entice owners to give up their cars temporarily, the EPA plans to offer them stand-in rental cars and free car washes or oil changes.

The agency is targeting most of the diesel vehicles on US roads, including BMW's X3, Chrysler's Grand Cherokee, GM's Chevrolet Colorado, the Range Rover TDV6 and the Mercedes-Benz E250 BlueTec. Diesel engines make up a tiny proportion of the overall car market in the US, but are much more prevalent in Europe.

Spokesmen for Fiat Chrysler, Mercedes, GM and JLR all said their companies did not install defeat devices in their cars. There has so far been no evidence that other carmakers have gamed the system.

The EPA official said the agency did not require manufacturers' co-operation for the broadening tests.

In a letter sent to carmakers last week, the EPA said it would increase its scrutiny of all vehicle emissions. However, it did not reveal publicly the details of the vehicles it was targeting.

Last month the EPA said it had identified 482,000 VW vehicles in the US with diesel engines fitted with defeat devices. The software detected when a diesel vehicle was undergoing a

laboratory test and switched on controls to reduce emissions. On the road, the controls were switched off and vehicles were found to emit up to 40 times the permitted level of nitrogen oxides.

Chris, Byron, Erin,

See below today's FT story. Wall Street Journal is asking whether we are "expanding our investigation," similar inquires to a couple weeks back. Previously we used this response. Please advise ASAP if we need to revise this statement:

EPA has not expanded the number of vehicles listed in the Notices of Violation sent to Volkswagen on Friday September 18.

Separate from the investigation, EPA's Office of Transportation Air Quality has expanded its routine vehicle compliance and oversight testing. Expanded testing is prompted by Volkswagen's actions and is not related to specific information about any other manufacturer. EPA and the California Air Resources Board are working together to acquire vehicles for additional testing. The focus is on light duty diesel vehicles but could expand to include gasoline vehicles.

ON BACKGROUND: Chris Grundler confirmed that EPA and CARB are procuring vehicles now for in use screening tests. This is not a confirmation of an expansion of the investigation launched on Friday. Instead, this is EPA describing what we are doing to enhance standard compliance and oversight procedures in light of recent information about VW's defeat devices.

No I don't think so. I think you'll will have to sort that out. Since this is for Fuel economy, Dave Good usually gets involved on how to input it. Best to look at previously submitted data. I sent you a couple examples before right?

EPA extends VW diesel emissions probe to other brands in US

Financial Times

More than two dozen diesel car models made by BMW, Chrysler, General Motors, Land Rover and Mercedes-Benz are under scrutiny as the US regulator that exposed Volkswagen's rigging of emissions tests probes whether rival carmakers engaged in similar cheating.

The Environmental Protection Agency's broadening search for software-based "defeat devices" that understate emissions during laboratory tests will encompass at least 28 diesel-powered models, according to a document seen by the Financial Times.

•□□□□□□□

The investigations are aimed at determining whether the German carmaker was alone in rigging emissions tests or if the practice is more widespread in the industry. VW has admitted that the devices, which turn on pollution controls during lab tests, had been fitted to up to 11m vehicles worldwide, leading to the resignation of Martin Winterkorn, its chief executive.

The EPA will initially test one used vehicle of each model and then widen the probe if it uncovers anything suspicious, said a senior agency official close to the investigation.

The news about the EPA's expanded investigation comes as Italy's antitrust authority announced it had opened an inquiry into VW to establish whether customers' car purchases were distorted by the German carmaker's emissions claims.

The competition watchdog for the eurozone's third-largest economy said in a statement that the investigation was related to models sold by VW between 2009 and 2015 with the brands Volkswagen, Audi, Seat and Skoda. The authority said it

wanted to know whether VW engaged in “improper commercial practices” in selling cars and commercial vehicles that had emissions standards “below the declared values”.

The US watchdog is using cars from rental agencies or borrowing them from owners it identifies via vehicle registration databases. To entice owners to give up their cars temporarily, the EPA plans to offer them stand-in rental cars and free car washes or oil changes.

The agency is targeting most of the diesel vehicles on US roads, including BMW’s X3, Chrysler’s Grand Cherokee, GM’s Chevrolet Colorado, the Range Rover TDV6 and the Mercedes-Benz E250 BlueTec. Diesel engines make up a tiny proportion of the overall car market in the US, but are much more prevalent in Europe.

Spokesmen for Fiat Chrysler, Mercedes, GM and JLR all said their companies did not install defeat devices in their cars. There has so far been no evidence that other carmakers have gamed the system.

The EPA official said the agency did not require manufacturers’ co-operation for the broadening tests.

In a letter sent to carmakers last week, the EPA said it would increase its scrutiny of all vehicle emissions. However, it did not reveal publicly the details of the vehicles it was targeting.

Last month the EPA said it had identified 482,000 VW vehicles in the US with diesel engines fitted with defeat devices. The software detected when a diesel vehicle was undergoing a laboratory test and switched on controls to reduce emissions. On the road, the controls were switched off and vehicles were found to emit up to 40 times the permitted level of nitrogen oxides.

Chris, Byron, Erin,

See below today's FT story. Wall Street Journal is asking whether we are "expanding our investigation," similar inquires to a couple weeks back. Previously we used this response. Please advise ASAP if we need to revise this statement:

EPA has not expanded the number of vehicles listed in the Notices of Violation sent to Volkswagen on Friday September 18.

Separate from the investigation, EPA's Office of Transportation Air Quality has expanded its routine vehicle compliance and oversight testing. Expanded testing is prompted by Volkswagen's actions and is not related to specific information about any other manufacturer. EPA and the California Air Resources Board are working together to acquire vehicles for additional testing. The focus is on light duty diesel vehicles but could expand to include gasoline vehicles.

ON BACKGROUND: Chris Grundler confirmed that EPA and CARB are procuring vehicles now for in use screening tests. This is not a confirmation of an expansion of the investigation launched on Friday. Instead, this is EPA describing what we are doing to enhance standard compliance and oversight procedures in light of recent information about VW's defeat devices.

The Environmental Protection Agency's broadening search for software-based "defeat devices" that understate emissions during laboratory tests will encompass at least 28 diesel-powered models, according to a document seen by the Financial Times.

•□□□□□□□□

The investigations are aimed at determining whether the German carmaker was alone in rigging emissions tests or if the practice is more widespread in the industry. VW has admitted that the devices, which turn on pollution controls during lab tests, had been fitted to up to 11m vehicles worldwide, leading to the resignation of Martin Winterkorn, its chief executive.

The EPA will initially test one used vehicle of each model and then widen the probe if it uncovers anything suspicious, said a senior agency official close to the investigation.

The news about the EPA's expanded investigation comes as Italy's antitrust authority announced it had opened an inquiry into VW to establish whether customers' car purchases were distorted by the German carmaker's emissions claims.

The competition watchdog for the eurozone's third-largest economy said in a statement that the investigation was related to models sold by VW between 2009 and 2015 with the brands Volkswagen, Audi, Seat and Skoda. The authority said it wanted to know whether VW engaged in "improper commercial practices" in selling cars and commercial vehicles that had emissions standards "below the declared values".

The US watchdog is using cars from rental agencies or borrowing them from owners it identifies via vehicle registration databases. To entice owners to give up their cars temporarily, the EPA plans to offer them stand-in rental cars and free car washes or oil changes.

The agency is targeting most of the diesel vehicles on US roads, including BMW's X3, Chrysler's Grand Cherokee, GM's Chevrolet Colorado, the Range Rover TDV6 and the Mercedes-Benz E250 BlueTec. Diesel engines make up a tiny proportion of the overall car market in the US, but are much more prevalent in Europe.

Spokesmen for Fiat Chrysler, Mercedes, GM and JLR all said their companies did not install defeat devices in their cars. There has so far been no evidence that other carmakers have gamed the system.

The EPA official said the agency did not require manufacturers' co-operation for the broadening tests.

In a letter sent to carmakers last week, the EPA said it would increase its scrutiny of

all vehicle emissions. However, it did not reveal publicly the details of the vehicles it was targeting.

Last month the EPA said it had identified 482,000 VW vehicles in the US with diesel engines fitted with defeat devices. The software detected when a diesel vehicle was undergoing a laboratory test and switched on controls to reduce emissions. On the road, the controls were switched off and vehicles were found to emit up to 40 times the permitted level of nitrogen oxides.

Subject: Correction and Relabel 2016 Golf R automatic

Hi Dave;

Following our discussion I am providing this summary. A new curb weight after production vehicles were weighed resulted in an increased ETW class for the 2016 2.0L Volkswagen Golf R with automatic transmission. Testing was performed and submitted to EPA for this new configuration at 3750 ETW and the EPA confirmatory testing was waived by Jim Snyder, and manufacturer's confirmatory testing was not needed. The original specific 5-cycle label results, to a tenth of a MPG, when compared to the new tests resulted in only a 0.4 MPG lower specific label city and highway label value. The rounded whole label values results in the same city and highway values, while the combined value dropped one MPG to 25 MPG from 26 MPG.

We agreed I would relabel this model with only the new data and the application for certification description for the Golf R automatic will be corrected. The curb weight of the manual 6-speed transmission configuration will also be corrected, however the ETW has not changed. I have relabeled this model in Verify (index #022) and the model type values on fuel economy labels will carry the new values going forward.

If you have any questions or concern please let me know.

Best regards,

Week ahead: House to vote on crude oil ban

By Devin Henry

House lawmakers will cast a vote on lifting the 40-year-old ban on crude oil exports, the next

- Healthcare
- Technology
- Transportation
- International

step in an expanding debate over the issue.

Cutting oil & gas methane makes cents. It creates quality manufacturing and service jobs, boosts America's small businesses and saves $1.2 billion in energy waste. Learn more www.EDF.org/methane

SPONSOR-GENERATED CONTENT

Members of both chambers of Congress have grappled with the ban this session, and its prospects for repeal have grown markedly over the last several months.

Faced with the prospects of declining prices at home and

Iranian oil flooding the market after sanctions on the country are lifted, oil producers and their legislative allies are pushing to open up the rest of the world to American crude as soon as possible.

The House will vote on a bill from Rep. Joe Barton (R-Texas) that would end the ban, a move House Majority Leader Kevin McCarthy (R-Calif.) promised last month. Senators are considering a similar measure.

Barton's bill — like one from Sens. Lisa Murkowski (R-Alaska) and Heidi Heitkamp (D-N.D.) — won't pass as is. The White House has come out against the measure, arguing the Commerce Department already

has the ability to approve crude exports under certain circumstances.

But supporters say they are open to finding some type of compromise, a prospect that presented itself at a recent Senate hearing on the matter. At a Banking Committee markup, most every Democratic senator voted against the bill, but some spoke in favor of working toward a resolution.

The bill's movement through Congress has kicked off a lobbying campaign on the issue. Oil producers say the measure will help provide a boost to the growing American oil industry, and they are hitting the airwaves to make their case in

several congressional districts around the United States.

Environmentalists and some oil refiners opposed to the measure are pushing back, however, warning against increased oil production's effect on climate change and domestic gasoline prices.

Elsewhere, House Science subcommittees on the environment and oversight will hold a hearing Wednesday on the Environmental Protection Agency's new ozone standards.

On Thursday, the investigative arm of the House Energy and Commerce Committee will hear from a Volkswagen executive on the car manufacturer's

emissions scandal. The committee's energy and power panel will also hold a hearing on the EPA's carbon emissions regulations for new and existing power plants on Tuesday.

In the Senate, Energy Secretary Ernest Moniz will testify before the Energy and Natural Resources Committee on the Strategic Petroleum Reserve on Tuesday.

The four commissioners of the Nuclear Regulatory Commission will testify at a Senate Environment and Public Works Committee hearing on Wednesday.

FRED UPTON, MICHIGAN
CHAIRMAN

FRANK PALLONE, JR., NEW JERSEY
RANKING MEMBER

ONE HUNDRED FOURTEENTH CONGRESS

Congress of the United States

House of Representatives

COMMITTEE ON ENERGY AND COMMERCE

2125 RAYBURN HOUSE OFFICE BUILDING
WASHINGTON, DC 20515–6115
Majority (202) 225–2927
Minority (202) 225–3641

September 29, 2015

Mr. Michael Horn
President and CEO
Volkswagen Group of America, Inc.
2200 Ferdinand Porsche Drive
Herndon, VA 20171

Dear Mr. Horn:

On September 18, 2015, the Environmental Protection Agency (EPA) notified Volkswagen AG, Audi AG, and Volkswagen Group of America, Inc. (collectively, VW) that the agency "determined that VW manufactured and installed defeat devices" in certain model year Volkswagen and Audi diesel passenger cars. The "defeat devices" took the form of software, according to the agency, that "sensed" when the vehicles were undergoing emissions testing and ensured emissions control systems were operating to pass the tests. During normal vehicle use, according to the agency, the software would "switch" to a different mode that produced certain emissions 10 to 40 times above EPA standards and in violation of the Clean Air Act. The scope of the alleged violations — affecting some 480,000 vehicles according to news reports — and EPA's assertion that VW admitted it "designed and installed" defeat devices in these vehicles, raise serious questions about VW's efforts to comply with its statutory obligations under the Clean Air Act.

The Committee on Energy and Commerce and its Subcommittee on Oversight and Investigations are investigating the facts and circumstances surrounding VW's use of software in vehicle emissions control systems to affect Clean Air Act related compliance and emissions test results. To assist the committee with its investigation, and pursuant to Rules X and XI of the U.S. House of Representatives, we ask that you provide to the committee the following:

1. All documents, including communications, relating to compliance with the Clean Air Act, EPA emissions standards and regulations, or testing of diesel emissions for all make and model year vehicles associated with the alleged violation(s).

2. All documents, including communications, relating to EPA and California Air Resources Board (CARB) inquiries concerning potential noncompliance of any VW models with emissions standards or with EPA's certificates of conformity applications.

3. All documents, including communications, relating to VW efforts to respond to EPA and CARB requests to explain potential noncompliance with EPA or California standards and emissions test requirements, including, but not limited to, VW deliberations concerning any and all recalls and technical solutions initiated or considered to address EPA or CARB concerns.

4. All documents, including communications, relating to any anomalies or discrepancies concerning actual on-road performance of VW models and the performance of those models under EPA or other testing conditions since January 2010.

5. All documents, including communications, relating to the development, testing, approval and use of the software installed in the electronic control module of diesel model passenger vehicles that EPA alleges acts as a "defeat device." This includes any documents, including communications, with any suppliers involved in the development of the electronic control module and any associated software.

6. A detailed timeline of events and activity related to the alleged violation(s) outlined in EPA's Notice of Violation dated September 18, 2015.

Please produce the requested information by October 13, 2015. We also request that you arrange VW to provide an initial briefing with committee staff to occur by October 2, 2015. Instructions for responding to the committee's document requests are included as an attachment to this letter.

We request that you arrange to provide this briefing with committee staff to occur by October 2, 2015. If you have questions regarding this request, please contact Peter Spencer or John Ohly of the majority committee staff at (202) 225-2927 or Elizabeth Letter or Ryan Gottschall of the minority committee staff at (202) 225-3641.

From: Vicki Salamon
Sent: Fri 10/2/2015 10:50:17 PM
Subject: EPA test

Dear Mr. Grundler,

In light of the recent news about Volkswagen I read the above EPA notification with great interest. "Gaming" EPA and other emission test protocols is not a new topic in the industry. I have been in many conversations where designs are promoted that can pass EPA tests but do not deliver the long term benefits both the EPA and the consumer expect.

For instance, in many new vehicle 'start/stop' systems, they work fine on the showroom floor but as soon as you drive them off the lot those systems begin to dramatically deteriorate. We have well documented test results that show under less than room temperature conditions, or even after a few months of use, battery based systems don't work when they should. How do OEMs handle that? They simply put software on board the car which shuts off the start/stop system, meaning the car will continue to idle at intersections, thus deactivating the fuel efficiency and emissions benefits of that design. Our Founder Chad Hall, spoke last year at The Battery Show in Novi, MI and specifically mentioned that this testing was being done falsely, and suggested that the EPA begin purchasing vehicles and testing them for emissions to ensure they meet the OEM specifications. I would be happy to provide you excerpts from that material.

The hybrid/EV/HEV markets, and in particular, the vendors, rely heavily on good information being used to support our claims that we can increase fuel efficiency and reduce emissions through the use of the best fitting technology. If consumers are purchasing a hybrid vehicle, paying more for it due to claims, and then do not achieve the performance claimed, then it gives a black eye to the entire industry. This should not happen, here or in other parts of the world, as it negatively impacts all of the players.

Ioxus has American-made technology that eliminates test "gaming" of such systems by reducing fuel consumption and emissions for the life of the vehicle, not just under ideal conditions on a test bed. Our ultracapacitor based start/stop systems deliver engine shut-offs in real world driving the same way that you see in a laboratory test, even after many years of use. Almost every start/stop system design you would test in American cars today would fail that same test after 6 months, because they use batteries which are not well suited for this application. Ultracapacitor technology for cars is cost-effective, and is in commercial use today. Most

recently GM has announced plans to use ultracapacitors for start/stop in the 2017 Cadillac.

The battery industry has spent far more than my company can afford to lobby OEMs to use a cheap battery based design which essentially "games" EPA testing. I would like to ask that you further review EPA testing requirements to include testing the vehicle's ability to achieve the stated fuel and environmental efficiencies not just on day-one, but for at least the first five years. If the vehicle cannot achieve these results expected from the CAFE standards, I urge you to consider a recall as the Europeans have done, to allow OEMs to retrofit start/stop system designs that will ensure American cars run as cleanly as EPA testing claims. Such designs are readily available at costs ranging between $40 and $160 per vehicle. I would be happy to provide you with more detail or talk with you live about any of these topics.

Sincerely,

Mr. Mark McGough

President & CEO

Ioxus, Inc.

Subject: RE: Follow up

Hi Peter,

My apologies for not including the budget doc.

On your questions about how much was the NVFEL budget increased over that time:

Off the record, we just can't find this information within this time period.

What we could find is the attached doc that shows the budget for the air office. It shows is a steady increase in funding over the years when the lab was closed.

We answered the question about why it was closed here, in the info we sent earlier:

On Background: VTL was a very outdated private testing facility that was going to need significant investments if the Agency wanted to continue to use it for recall testing once the more stringent, Tier 2 standards for cars and light trucks were implemented. It would not have been a wise choice to invest public dollars to upgrade a private facility when we had a much larger national lab that could do this work. We chose to invest in the public facility.

Hope this helps.

Best,

Julia P. Valentine

Sent: Friday, October 02, 2015 12:55 PM
To: Whoriskey, Peter
Subject: RE: Follow up

Here you go, Peter.

This should wrap it up for us:

Washington Post (Peter Whoriskey) asked:

I would like to verify that the EPA's regular road testing of cars for emissions compliance did not continue after the closure of the Virginia Testing Laboratory, where Emmet Arndt had been running a pilot program to do so. Chris Grundler indicated that the regular road testing of cars for emissions compliance hadn't continued after the closure, indicating that it wasn't continued because the priorities led them to focus on heavy duty engines, where a larger portion of the pollution comes from. Byron Bunker may have been saying something different, though, so I want to make sure I've understood correctly.

Response:

We have looked into the ROVER pilot program and the following is based on recollections from current EPA staff. VTL had limited capacity to conduct chassis dynamometer testing to audit emissions systems in light duty cars and trucks. The goal of the VTL ROVER pilot program was to increase the number of vehicle models that could be screened for defective emissions systems (not defeat device detection) given limited this limited capacity. The pilot program conducted ROVER testing of vehicles on a test route that closely matched the Federal Test Procedure (FTP) used on the dynamometer. Those screening results were then used to prioritize chassis dynamometer testing as part of recall investigations. Since the pilot testing tried to mimic the FTP, it is quite possible that the defeat device would have detected the pilot screening as well. It is also possible that Volkswagen could have become aware of the pilot testing and added additional lines of software code to defeat the ROVER testing as well. The problem with such hypotheticals is that no one can know what would have happened in those cases.

The facilities at the National Vehicle and Fuel Emissions Laboratory (NVFEL) where we currently conduct almost all of our testing can run chassis dynamometer tests with far greater efficiency. Mr. Arndt's idea to use on-road screening (Using ROVER/PEMS) is not necessary given the higher testing capacity that we now have at

NVFEL.

NVFEL has 23 PEMS units, and PEMS testing remains an important screening tool for broader evaluation of in-use emissions. Over the last ten years, we have used PEMS units to test emissions from light-duty passenger cars, heavy-duty trucks and non-road equipment like skid steer loaders. As Chris has indicated the most significant focus of that testing has been heavy-duty diesel trucks both because that industry has a history of introducing defeat devices and because roughly 40% of NOx emissions from on-road sources come from this source.

On Background: VTL was a very outdated private testing facility that was going to need significant investments if the Agency wanted to continue to use it for recall testing once the more stringent, Tier 2 standards for cars and light trucks were implemented. It would not have been a wise choice to invest public dollars to upgrade a private facility when we had a much larger national lab that could do this work. We chose to invest in the public facility.

Subject: RE: Follow up

Hi Peter,

My apologies for not including the budget doc.

On your questions about how much was the NVFEL budget increased over that time:

Off the record, we just can't find this information within this time period.

What we could find is the attached doc that shows the budget for the air office. It shows is a steady increase in funding over the years when the lab was closed.

We answered the question about why it was closed here, in the info we sent earlier:

On Background: VTL was a very outdated private testing facility that was going to need significant investments if the Agency wanted to continue to use it for recall testing once the more stringent, Tier 2 standards for cars and light trucks were implemented. It would not have been a wise choice to invest public dollars to upgrade a private facility when we had a much larger national lab that could do this work. We chose to invest in the public facility.

Hope this helps.

Best,

Julia P. Valentine

Julia:

This addresses just one of my three follow up questions.

The others were:

Why was VTL closed?

How much was the NVFEl budget increased over that time?

Thanks.

Peter

Subject: RE: Follow up

Here you go, Peter.

This should wrap it up for us:

Washington Post (Peter Whoriskey) asked:

I would like to verify that the EPA's regular road testing of cars for emissions compliance did not continue after the closure of the Virginia Testing Laboratory, where Emmet Arndt had been running a pilot program to do so. Chris Grundler indicated that the regular road testing of cars for emissions compliance hadn't continued after the closure, indicating that it wasn't continued because the priorities led them to focus on heavy duty engines, where a larger portion of the pollution comes from. Byron Bunker may have been saying something different, though, so I want to make sure I've understood correctly.

Response:

We have looked into the ROVER pilot program and the following is based on recollections from current EPA staff. VTL had limited capacity to conduct chassis dynamometer testing to audit emissions systems in light duty cars and trucks. The goal of the VTL ROVER pilot program was to increase the number of vehicle models that could be screened for defective emissions systems (not defeat device detection) given limited this limited capacity. The pilot program conducted ROVER testing of vehicles on a test route that closely matched the Federal Test Procedure (FTP) used on the dynamometer. Those screening results were then used to prioritize chassis dynamometer testing as part of recall investigations. Since the pilot testing tried to mimic the FTP, it is quite possible that the defeat device would have detected the pilot screening as well. It is also possible that Volkswagen could have become aware of the pilot testing and added additional lines of software code to defeat the ROVER testing as well. The problem with such hypotheticals is that no one can know what would have happened in those cases.

The facilities at the National Vehicle and Fuel Emissions Laboratory (NVFEL)

where we currently conduct almost all of our testing can run chassis dynamometer tests with far greater efficiency. Mr. Arndt's idea to use on-road screening (Using ROVER/PEMS) is not necessary given the higher testing capacity that we now have at NVFEL.

NVFEL has 23 PEMS units, and PEMS testing remains an important screening tool for broader evaluation of in-use emissions. Over the last ten years, we have used PEMS units to test emissions from light-duty passenger cars, heavy-duty trucks and non-road equipment like skid steer loaders. As Chris has indicated the most significant focus of that testing has been heavy-duty diesel trucks both because that industry has a history of introducing defeat devices and because roughly 40% of NOx emissions from on-road sources come from this source.

On Background: VTL was a very outdated private testing facility that was going to need significant investments if the Agency wanted to continue to use it for recall testing once the more stringent, Tier 2 standards for cars and light trucks were implemented. It would not have been a wise choice to invest public dollars to upgrade a private facility when we had a much larger national lab that could do this work. We chose to invest in the public facility.

THOMSON REUTERS

INTERVIEW -EPA says post-VW emission regime permanent, more change possible

02-Oct-2015 06:38:18 PM

By David Morgan

WASHINGTON, Oct 2 (Reuters) - The tougher auto emission tests that U.S. regulators adopted in the wake of the Volkswagen cheating scandal are permanent and could lead to more regulations down the road if more problems surface, a senior Environmental Protection Agency official said on Friday.

Christopher Grundler, director of the EPA's Office of Transportation and Air Quality, told Reuters that new emission tests announced on Sept. 25 (Full Story) would continue "indefinitely" as part of the agency's effort to detect so-called defeat devices of the kind Volkswagen AG VOWG_p.DE has admitted using to elude EPA laboratory emission tests for diesel vehicles.

Volkswagen employed a software algorithm that turned the diesel vehicles' emission controls on during lab tests but left them off during normal driving. The new EPA regime includes on-road emission tests, the approach that first raised questions about Volkswagen vehicle emissions in independent tests.

"We are permanently changing the oversight system," Grundler said in an interview. "We are integrating new tests and evaluations that we will be applying to both production vehicles and pre-production vehicles, as well as in-use vehicles."

The tougher EPA emissions test regime could add to auto industry costs.

But the scale of the Volkswagen scandal, combined with reports of potential emission hurdles for other automakers, have also raised speculation within the industry that the EPA could decide not to limit on-road tests to defeat device investigations but instead require automakers to undergo the more stringent tests while certifying new vehicles for sale in the

U.S. market.

The Center for Biological Diversity, a nonprofit environmental group, petitioned EPA this week to require on-road emissions tests for all cars, sport utility vehicles, vans and light trucks.

The prospect of more stringent testing has sent automakers scurrying to shop for on-road test equipment that could be used to ensure compliance. The equipment, known as portable emissions measurement systems, are sold by a number of companies in the United States, including Japanese manufacturer Horiba Ltd 6856.T, U.S.-based Sensors Inc and AVL GmbH of Austria.

"I've seen four or five serious inquiries just in the last two or three days alone," said an executive close to on-road test equipment manufacturers. "It's not just people doing research anymore. It's the manufacturers."

Grundler said the EPA is not considering more fundamental regulatory changes. But that could change if the new test methods uncover more widespread problems in the industry, he said.

"If we find through this new oversight that these problems are not limited to Volkswagen, we'll have to face that question – whether or not we need to make any regulatory changes," he said.

"If we do," Grundler added, "we've got the authority."

The Volkswagen scandal has spawned investigations around the world, including a U.S. congressional probe that is expected to press for details of the German automaker's actions but also examine how the EPA missed the cheating strategy for years, according to aides.

A recent report from the nonprofit International Council on Clean Transportation, which commissioned research that helped uncover the Volkswagen scandal, said vehicles from Volvo AB VOLVb.ST, Renault SA RENA.PA and Hyundai Corp 011760.KS have also shown high emission levels in European tests designed to replicate on-road driving.

The report said the vehicles would have a hard time passing new environmental standards being considered in Europe.

The EPA, which has barred VW from selling new diesel models in the United States until a fix has been approved, has said it could impose penalties on the company of up to $18 billion. But Bernstein Research analyst Max Warburton estimated the agency could impose a fine of no more than $7.4 billion, saying the penalties would apply only to the first 10 cars.

But Grundler disputed that calculation: "It's not the first 10 cars. The law provides $37,500 per violation, and the investigation will determine how many violations."

US regulator missed its best chance to catch VW cheating

BY JASON KEYSER
OCT. 2, 2015 8:18 AM EDT

CHICAGO (AP) — More than a decade ago, the U.S. Environmental Protection Agency helped develop a technology that ultimately was used by an independent laboratory to catch Volkswagen's elaborate cheating on car emissions tests. But EPA used the technology primarily to test trucks rather than passenger cars because such heavy equipment was a much bigger polluter.

That decision meant that the U.S. regulator missed its best chance to foil the German carmaker's deception early on. The portable emissions measurement systems that EPA pioneered might have subjected VW diesel cars to on-road tests and discovered they were spewing up to 40 times the allowable levels of key pollutant nitrogen oxide under normal driving conditions.

Without that test, VW was virtually home free and evaded detection for seven years.

"If EPA had used the technology back then (on diesel cars), we could have caught it," said Margo Oge, who was director of the EPA's office of Transportation and Air Quality at the time and headed the office for 18 years until 2012. But she doesn't regret EPA's decision to focus that technology on manufacturers of trucks and heavy equipment, which had a record of cheating on tests and accounted for a much bigger portion of U.S. pollution than the nascent diesel car business.

Interviews with former and current EPA officials and other auto and environmental experts suggest that although the U.S. has the world's toughest auto emissions standards, federal and state regulators don't have the resources to conduct the kind of comprehensive tests that might have nabbed VW, and they rely on automakers to self-report data in a kind of honor system.

"They trust the auto companies to tell the truth. And the auto companies have proven time and again that they don't tell the truth," said Dan Becker, director of the Safe Climate Campaign and a veteran of the fight for tougher car emissions regulation. "We can't allow the students to test

themselves and submit their own grades."

The crucial step in the U.S. testing system is "certification" of each new model or family of models, allowing them to be sold in the U.S. To get that EPA stamp of approval, car manufacturers run their own tests and submit sometimes thousands of data points to the EPA.

The EPA requires carmakers to follow a test script that has not changed in more than a decade. The script must be the same, experts said, in order to compare vehicles or validate data. They put the vehicles on a dynamometer — a treadmill for cars — that accelerates and slows down at a programmed interval known as a "drive cycle." A device measures pollutants from the tailpipe.

Aware of the script, VW installed 2009-2015 diesel models with software that sensed when the vehicles were on the treadmill and switched the emissions system to trap the right amount of nitrogen oxide. That sophisticated software algorithm sensed things such as the position of the steering wheel, speed, the duration of the engine's operation and barometric pressure.

Out on the road, the exhaust system would switch back to allowing more pollutants to pass through the nitrogen oxide trap and spill out of the tail pipe.

Volkswagen's 2009 Jetta and Jetta Sportwagen models passed the dynamometer tests and were certified for sale in the U.S.

In addition to certification, the EPA runs spot checks on cars representing 15-20 percent of models in a year to verify the data from manufacturers.

"We can't do a 100 percent check of every data point for every model," said Byron Bunker, director of the EPA's vehicle compliance program. "We focus on new vehicles, new technologies or those where we have a concern."

EPA's National Fuel and Vehicle Emissions Laboratory in Ann Arbor, Michigan, ran spot checks on VW's 2009 models that validated the company's data by running an identical series of laboratory tests.

After that, emissions tests are not required at U.S. ports of entry for imported cars or at dealerships. And most states do not require owners of diesel cars to submit them to an emissions test to get a car registration renewed.

The 21 states that do test diesel vehicles usually are not equipped to catch cheaters. Most only examine data stored in on-board-diagnostics systems for a record of faults that would indicate a broken component or a maintenance problem. But in the case of the Volkswagens, if the cars were operating as designed, no fault would appear.

It was only when researchers connected with West Virginia University last year used the technology pioneered by EPA, that VW's duplicity was finally exposed by subjecting the cars to actual road tests. Threatened with having its new models banned from the U.S. market, VW admitted the cheating.

In response, EPA last month announced it would toughen testing and is keeping the details secret from carmakers. The new methods could include the use of the portable devices and other tests that replicate real-world driving or just changing the treadmill script. The EPA will have to prioritize its limited money for testing, Christopher Grundler, the agency's current Transportation and Air Quality director, said last week. The regulator's budget has been slashed 21 percent by Congress since fiscal 2010, according to data on its website.

European Commission - Fact Sheet

FAQ - Air pollutant emissions standards

Brussels, 25 September 2015

How are pollutant emissions regulated at EU level?

Directive 2007/46/EC provides a common legal framework for the type approval of cars, vans trucks, buses and coaches. Type approvals are subject to fully harmonised EU requirements under:

- legislation defining the emission limits, such as Regulation 715/2007/EC - approved by the European Parliament and the Council;

- implementing legislation defining the test procedures - reviewed according to comitology procedure by the technical Committee for Motor Vehicles (TCMV) where all Members states are represented.

The Euro 5 and 6 Regulation 715/2007/EC, agreed by the European Parliament and Council, specifies emission limits for all important toxic pollutants. These include nitrogen oxides (NOx, i.e. the combined emissions of NO and NO2). The currently applicable NOx emission limit for new diesel passenger cars and light vans sold in the EU is 80 mg/km.

What is the Commission doing to address shortcomings of emissions testing of diesel vehicles?

Currently emissions are measured on a laboratory test cycle (NEDC) which does not reflect the emissions of vehicles in normal driving conditions. The Commission has therefore been working intensely to develop robust procedures for the emission testing of vehicles in real driving. Currently nitrogen oxides (NOx) emissions of diesel vehicles measured on the road may in reality exceed substantially the emissions measured on the regulatory test cycle (NEDC), though in most cases probably in line with the applicable legislation. To address this shortcoming, the Commission has been working to develop Real Driving Emission (RDE) test procedures. They replace the current laboratory based testing and will assess the emission performance of vehicles on roads. The new procedure was voted in May 2015 by the respective regulatory committee (Technical Committee for Motor Vehicles, TCMV) where all Members states are represented, and it will come into force in January 2016.

How will the RDE test procedure work? Will it eliminate the risk of cheating with a defect devices?

The RDE procedure will complement the laboratory based procedure to check that the emission levels of nitrogen oxides (NOx), and at a later stage also particle numbers (PN), measured during the laboratory test are confirmed in real driving conditions. This means that the car will be driven outside and on a real road according to random acceleration and deceleration patterns. The pollutant emissions will be measured by portable emission measuring systems (PEMS) that will be attached to the car. RDE testing will reduce the currently observed differences between emissions measured in the laboratory, and those measured on road under real-world conditions, and to a great extent limit the risk of cheating with a defeat device.

When will the RDE test procedure be in force?

In May 2015 the new procedure received a positive vote from the Technical Committee for Motor Vehicles, where all Members states are represented, and it will come into effect in January 2016. In this initial stage the portable emissions system will be used for monitoring purposes and it will have no implications on the conformity certificate issued by the national type-approval authority (TAA). Work is now underway to establish the regulatory not-to-exceed (NTE) emission limits applicable in RDE testing. These limits define the acceptable small degree of deviation from the emission limit set in Regulation 715/2007/ECto take into account measurement uncertainties present in the on-road testing. The NTE approach has proven its robustness in the assessment of, for example, emissions form heavy-duty vehicles. Other elements that are being discussed are test boundary conditions, such as temperature, altitude or velocity. All the details related to the RDE procedure for passenger cars and vans are currently being discussed with stakeholders and Member States. The Commission services aim to have the not-to-exceed emission limits applicable for all type approvals in the autumn 2017 and for new vehicles in the autumn 2018. The not-to-exceed limits should reflect environmental objectives

as well as economic and technical feasibility.

What does WLTP stand for?

A new test procedure, the Worldwide harmonized Light vehicles Test Procedures (WLTP), has been adopted in the United Nations system (UNECE) for measuring pollutant emissions and CO2 emissions from passenger cars and light commercial vans in the laboratory. The implementation process in the EU has started in parallel. The focus of the improvements is CO2 emissions testing. For NOx, RDE testing will complement laboratory test procedures.

Who is responsible for the emission testing?

Before vehicles can be put on the market, they are tested by a national technical service in accordance with the EU legislation. The national type-approval authority (TAA) grants the approval on the basis of these tests. The manufacturer may make an application for approval in any EU country. Once approved in one Member State, all vehicles of its type may be registered throughout the EU. The type approval legislation requires that cars meet the limit values 'under normal conditions of use'. In practice this requirement is implemented by establishing a test cycle to put the car through its paces, and checking whether the cycle emissions are below the limit value. Any car whose emissions are below the limit value is fit for type approval. The detailed description and rules for these test are laid down in the implementing legislation pursuant to the Euro 5/6 Regulation 715/2007/EC. The same monitoring system will continue to apply for the RDE testing and the portable emission measurement system.

Who checks that national authorities actually carry out the tests correctly?

Market surveillance and control of compliance with the type-approval legislation is a competence of the Member States. Article 30 of the Framework Directive requires Member States to take all the necessary measures to ensure that vehicles conform to their type-approval and Member States other than the Member State which granted the type-approval can do their own tests if they feel that here is a breach of the legislation. If a Member State demonstrates that there is a problem, it may ask the Member State which granted the type-approval to take corrective measures.

Are there any emissions tests after the vehicle has been type approved?

In accordance with type-approval legislation, vehicles are subject to checks on conformity of production and also to measures to ensure in-service conformity. Conformity of production tests are carried out on samples of freshly produced vehicles and ensure that their emissions values are in-line with the ones measured at type-approval. In-service conformity tests are carried out on vehicles that have been in use for a certain number of kilometres or years to ensure that they still have a pollution performance that is within a certain margin of the type-approval values. The procedure used for both tests is the same laboratory test that was done for type-approval.

Can the EU impose penalties if the rules regarding type approval are violated?

Under the Euro 5/6 legislation, it is for the Member State which has type-approved a vehicle to impose penalties for breach of the type-approval procedure. In particular, if it were determined that a car type-approved in a Member State had been modified to beat the cycle, the Member State which type-approved the car would be responsible for imposing penalties. More specifically, article 30(1) of Directive 2007/46/EC states that if a Member State which has granted an EC type-approval finds that new vehicles do not conform to the type it has approved, it shall take the necessary measures, including, where necessary, the withdrawal of type-approval, to ensure that production vehicles are brought into conformity with the approved type. In addition, Article 46 of the same Directive requires Member States to determine the penalties and to take all necessary measures for their implementation.

Are defeat devices illegal in the EU?

Yes. Defeat devices are forbidden in the EU. Article 5 (2) of Euro 6 Regulation 715/2007/EC prohibits the use of defeat devices. Article 3(10) defines defeat device as any element of design which senses temperature, vehicle speed, engine speed (RPM), transmission gear, manifold vacuum or any other parameter for the purpose of activating, modulating, delaying or deactivating the operation of any part of the emission control system, that reduces the effectiveness of the emission control system under conditions which may reasonably be expected to be encountered in normal vehicle operation and use.

Why did the Commission decide to introduce RDE testing?

Once it became clear that the test procedure set out in Regulation 715/2007/ECand its implementing legislation was not reflecting real driving emissions of vehicles, the European Commission decided in 2010 to address this situation by complementing the current laboratory test with a real-driving test procedure, which should be able to capture the wide range of driving conditions encountered on the road. A "real-driving emissions of light duty vehicles" working group composed by industry stakeholders and Member States representatives was set up to develop a test procedure to directly

assess the regulated emissions of light duty vehicles under real driving conditions. In the course of the work of the working group, two candidate procedures were investigated: a randomised test cycle and the use of portable emission measurements systems (PEMS). Following an in-depth analysis of both approaches, on-road testing with a portable device was judged to better cover the wide range of driving and ambient conditions than laboratory test cycles. As soon as the new procedure was ready from the technical point of view, the Commission proposed draft legislation which was voted in May 2015 by the respective regulatory committee (TCMV).

How does regulation differ in the EU and US both on emission limits and on testing procedures?

In the US, the Clean Air Act (CAA) requires every engine and motor vehicle to meet a set of emission standards and conformity requirements. Anyone wishing to sell an engine or vehicle within the United States must demonstrate compliance with the CAA and all applicable EPA regulations. Today, in the EU as well as in the US, vehicles are being tested on a chassis dynamometer in the lab according to well-described driving patterns (= regulatory test cycles) for compliance with regulatory emission limits. Test cycles are different in the EU and US. In the US there are several test cycles while in the EU there is only one. However, the differences in the test cycles are not relevant, since any laboratory test cycle can be defeated. As for the emission limits for NOx, in the US it is 50mg per mile, while in the EU it is of 80mg per km but also this difference is not relevant for the existing case. This is why the introduction of the RDE procedure is so important, as it would allow authorities to detect the use of defeat devices.

What are the applicable limits for CO2 emissions?

Unlike pollutants, at low concentrations CO2 emissions are not directly harmful to our health, but cause climate change. That is why the EU is reducing its CO2 emissions, including from transport. In contrast to pollutant emissions, for CO2 emissions there are no maximum limits per vehicle. But CO2 emissions are monitored and EU Regulations 443/2009 and 510/2011 establish CO2 performance standards for cars and vans and emission reduction targets. By 2021, the fleet average to be achieved by all new cars is 95 grams of CO2 per kilometre. This means a fuel consumption of around 4.1 l/100 km of petrol or 3.6 l/100 km of diesel. For vans, the target is 147 grams of CO2 per kilometre, corresponding to around 5.5 l/100 km of diesel. To help drivers choose new cars with low fuel consumption, cars have a label showing their test cycle fuel efficiency and CO2 emissions. If defeat devices were used to influence test CO2 emissions, it is likely the relative size of their impact would be lower than for pollutant emissions. For CO2 emissions the laboratory test procedure should improve with the introduction of the "Worldwide harmonized Light vehicles Test Procedure".

What is the Commission doing to tackle air pollution?

The Commission adopted a Clean Air Policy Package in December 2013, consisting of new air quality objectives for the period up to 2030, a revised National Emission Ceilings Directive with stricter national emission ceilings for the six main pollutants (SO2, NOx, non-methane VOCs, NH3, PM2.5 and CH4), and a proposal for a new Directive to reduce pollution from medium-sized combustion installations. The local air quality limits which may not be exceeded are set under the Ambient Air Quality Directives. The Directives address three main pollutants, particulate matter (PM10) originating from emissions from industry, traffic and domestic heating, sulphur dioxide (SO2) and nitrogen dioxide (NO2). Infringement procedures in this area are about the exceedances of the limit values which are measured at the monitoring stations in each Member State and appropriate measures to comply with these limit values.

How does the EU inform citizens about the consequences of air pollution and car emissions?

EU legislation foresees that Member States must ensure that up-to-date information on ambient concentrations of the different pollutants is routinely made available to the public. When information or alert thresholds are exceeded, Member States need to inform the public about the exceedance and the actions that are eventually taken. To facilitate consumer choice, citizens will also be informed of the real-world vehicle emissions measured according to the new test cycle (from the Euro 6 deadlines onwards). At EU level a number of sources exist that provide information to the public. Several important databases concerning air quality are managed by the European Environment Agency (EEA), including the AirBase database, the database on ozone. The Ambient Air Quality Portal contains a collection of documents delivered by each country, concerning various topics, including air quality.

Subject: Morning Consult Energy: Week in Review & What's Ahead

By Colleen Leahy

Week in Review

EPA action

The Environmental Protection Agency came out with a new regulation and a controversial update to an old standard. The new regulation will tighten emissions standards for oil refineries, placing stricter limits on carcinogenic chemicals such as benzene, with implementation in 2018. The controversial update dealt with standards for the amount of ground-level ozone that's allowed in the atmosphere. EPA changed the threshold from 75 parts per billion to 70 ppb, a figure environmentalists warned is still high enough to warrant litigation over a possible violation of the Clean Air Act.

Oil export bill passes Senate committee, but there's a catch

The Senate Banking Committee approved a bill that would lift the crude oil export ban. Sen. Pat Toomey (R-Pa.) was hoping for an amendment to abolish the federal mandate to blend renewable ethanol-based fuels with gasoline. That didn't fly, but another amendment, one that may be a poison pill for the legislation, did. That amendment would change the terms of the Iran deal by requiring Iran to pay outstanding court judgments to U.S. victims of terrorism before sanctions are lifted.

The VW saga continues

Regulators in Europe and Brazil said they plan to step up their emissions-testing protocols as a result of the Volkswagen scandal, and EPA followed suit. EPA said it would start including real-world road tests and check for emissions-falsification software, a big change from its previous practice of relying mostly on compliance statements from auto manufacturers and some lab testing. In Congress, House Energy and Commerce Committee members requested documents from EPA and Volkswagen in anticipation of a hearing on the issue. In spite of all that, though, VW may actually not face criminal charges due to a loophole for automobiles in the 1970 Clean Air Act.

What's Ahead

Both the House and Senate are in session this week. The House will hold leadership

elections on Oct. 8.

Volkswagen Group of America President and Chief Executive Officer Michael Horn, as well as EPA representatives, will testify before the House Energy and Commerce Oversight and Investigations Subcommittee on Thursday.

Although Congress allowed the half-century-old Land and Water Conservation Fund to expire last week, don't expect it the issue to go away as fund supporters are considering plans to revive it. Reauthorization may come up as a rider to a long-term surface transportation bill or as part of an omnibus spending bill in December.

Mark Your Calendars (All Times Eastern)

Monday
AFPM Q&A technology forum @ 8 a.m.
Environmental Law Institute Supreme Court review & preview @ 12 p.m.
NRC pre-submittal meeting with Duke Energy Progress Inc. @ 1 p.m.

Exxon Mobil Loses $236M MTBE Cleanup Appeal In NH

The New Hampshire Supreme Court upheld a $236 million trial judgment against Exxon Mobil in a groundwater contamination case Friday, capping 12 years of litigation in the state over a gasoline additive that is meant to reduce air pollution but may cause cancer.

Judge Sinks Bid To Trim Sites From Puerto Rico MTBE MDL

A New York federal judge refused Thursday to trim three "release sites" from Puerto Rico's suit accusing Shell Oil Co. and others of contaminating its groundwater with a common gasoline additive, saying the defendants hadn't shown that the commonwealth's claims at those sites were time-barred.

USDA Must Face Enviros' Suit Over Organic Rule, Court Says

A California federal judge has refused a bid by the U.S. Department of Agriculture to toss a suit by environmental groups who say the agency shifted fertilizer requirements for organic food growers without notifying the public as required.

Switzerland Bans Some VWs From Its Roads Amid Scandal

Switzerland's transportation authority said Friday that it will not allow any new Volkswagen vehicles to be registered in the country as of Monday if they are affected by the automaker's emissions scandal.

IRS To Issue Energy Credit Property Regulations

The Internal Revenue Service said on Friday that it plans to issue regulations aimed at certain types of property qualifying for an energy credit, seeking public comment on how to define solar energy, wind and other forms of energy-related property.

EXPERT ANALYSIS

An Era Of Arctic Oil Exploration, Upended

After seven years of preparation, litigation and billions of dollars invested, Royal Dutch Shell PLC's recent decision to abandon its exploration program in the U.S. Arctic "for the foreseeable future" marks a pause — not the end — of a new era of Arctic oil and gas exploration. While oil prices weaken and dates change, litigation over the future of the Chukchi Sea rages on, say Joseph Kakesh and Steven Richardson of Wiley Rein LLP.

LEGAL INDUSTRY

Most Feared Plaintiffs Firm: Hagens Berman

Hagens Berman Sobol Shapiro LLP has risen to the peaks of plaintiff work, growing from its humble beginnings as a nine-attorney firm in Seattle to serving as co-lead counsel on giant class actions against industry leaders like Apple, Toyota and the NCAA.

Trial Ace: WilmerHale's Bill Lee

WilmerHale partner Bill Lee, one of Apple's lead attorneys in the smartphone wars, only stumbled upon patent law more than a decade into his legal career, but he learned long before that — as a high school and collegiate soccer player — that success in any competition requires a team effort.

The 5 Worst Things To Do On Cross-Exam

Stifling a witness during cross-examination or losing control of the exchange are common pitfalls that can jeopardize what is widely considered one of the most important moments of any jury trial, seasoned attorneys say. Here, Law360 looks at the five biggest mistakes attorneys make during cross-examination.

Dewey Trial Stretches On With No Sign Of A Verdict

Jury deliberations in the trial of the former executive leadership of Dewey & LeBoeuf LLP stretched into the 11th full day on Friday, with an unusually quiet panel giving no word about when the marathon larceny and fraud trial will conclude.

Legal Industry Added 4,700 Jobs In Sept., Report Says

The legal services sector rebounded from a tough summer to gain a sizable 4,700 jobs in September, according to a report on Friday by the U.S. Bureau of Labor Statistics, a figure that one expert says reflects an increase in deal work.

The NLRB Developments GCs Should Know About

The National Labor Relations Board spent its summer preparing to say goodbye to outgoing member Harry Johnson and issuing a flurry of rulings that touched on questions including what defines joint employers, student athletes and employer successors. Here, Law360 looks at the rulings that should be on GCs' radar.

Exxon Mobil Loses $236M MTBE Cleanup Appeal In NH

The New Hampshire Supreme Court upheld a $236 million trial judgment against Exxon Mobil in a groundwater contamination case Friday, capping 12 years of litigation in the state over a gasoline additive that is meant to reduce air pollution but may cause cancer.

Judge Sinks Bid To Trim Sites From Puerto Rico MTBE MDL

A New York federal judge refused Thursday to trim three "release sites" from Puerto Rico's suit accusing Shell Oil Co. and others of contaminating its groundwater with a common gasoline additive, saying the defendants hadn't shown that the commonwealth's claims at those sites were time-barred.

USDA Must Face Enviros' Suit Over Organic Rule, Court Says

A California federal judge has refused a bid by the U.S. Department of Agriculture to toss a suit by environmental groups who say the agency shifted fertilizer requirements for organic food growers without notifying the public as required.

Switzerland Bans Some VWs From Its Roads Amid Scandal

Switzerland's transportation authority said Friday that it will not allow any new Volkswagen vehicles to be registered in the country as of Monday if they are affected by the automaker's emissions scandal.

IRS To Issue Energy Credit Property Regulations

The Internal Revenue Service said on Friday that it plans to issue regulations aimed at certain types of property qualifying for an energy credit, seeking public comment on how to define solar energy, wind and other forms of energy-related property.

As part of its ongoing investigation into the Volkswagen emissions scandal, the U.S. House of Representative's Energy & Commerce Committee announced Thursday that the German automaker's top U.S. executive, along with an official from the U.S. Environmental Protection Agency, will testify before a house subcommittee next week.

Feds Continue Pipeline Safety Push With New Proposals

The U.S. Department of Transportation has proposed long-awaited rules that would tighten safety requirements for pipelines carrying oil and other hazardous liquids, including expanding the use of leak detection systems and requiring inspections of pipelines in areas hit by extreme weather or natural disasters.

USDOT To Streamline $20B Hudson River Tunnel Project

Amtrak and federal and state agencies will push ahead with plans to build a new $20 billion passenger rail tunnel connecting New York and New Jersey, starting with an expedited environmental review, representatives for involved organizations confirmed Friday.

ENFORCEMENT

Rice Energy Unit Challenges Pa. DEP's Pipeline Fine

A Rice Energy Inc. unit filed on Thursday to challenge a nearly $500,000 penalty imposed by the Pennsylvania Department of Environmental Protection over violations of state laws connected to construction of a gas pipeline in Greene and Washington counties.

LITIGATION

EPA Says DC Circ. Can Review Texas Issues In Rule Challenge

The U.S. Environmental Protection Agency on Thursday asked the D.C. Circuit not to send back to the Fifth Circuit certain allegedly "Texas-specific" issues raised in a challenge to the EPA's rule tightening startup, shutdown and malfunction practices in 36 states.

VW To Face German Investor Actions, Litigation Funder Says

Bentham Europe Ltd. has charged out of the gates to fund impending German shareholder litigation against Volkswagen Group over its failure to tell investors about its practice of installing software in vehicles to avoid complying with emissions standards, the company said Thursday.

Liberty Says Texas Law Applies In Sinkhole Suit

Liberty Insurance Underwriters Inc. told a Texas federal court Friday that its battle with Occidental Chemical Corp. and Texas Brine LLC over liability for a massive sinkhole is governed by Texas law because the insureds are based in that state.

Victims' Families Want Quebec Derailment Suit In State Court

Families of the victims of a train derailment in Quebec, Canada, asked a Texas federal judge on Friday to remand a wrongful death and injury suit against Canadian Pacific Railway Co. to state court, arguing that the case was removed because it was incorrectly classified as a mass civil action.

Feds Call In Mine Safety Attys As Blankenship Trial Begins

West Virginia's U.S. attorney has conscripted two Department of Labor mine safety lawyers as special prosecutors for the trial of former Massey Energy Co. CEO Don Blankenship, new filings revealed Thursday, as jury selection began on charges he mandated safety shortcuts before a 29-death mine explosion.

Tribe Sues BP Over Deepwater's Effect On Natural Resources

A Louisiana tribe that failed to reach a settlement with BP in the massive multidistrict litigation over the Deepwater Horizon oil spill on Thursday sued the oil giant separately, accusing it of damaging its property and cultural and natural resources during the spill and subsequent cleanup process.

Pa. DEP Wants Gas Group's Permit Program Challenge Axed

A Pennsylvania court was urged Thursday to find that a gas industry group did not have standing to pursue claims accusing environmental regulators of running a permitting program that didn't comply with a landmark ruling that gutted legislation aimed at establishing statewide rules for drillers.

NASA Subcontractor Wrongly Axed From Paint Job, Suit Says

A subcontractor fired from a painting job at a Mississippi NASA site after being accused of lead contamination hit back with a lawsuit Thursday, saying the claims were baseless and asking a Louisiana federal judge to award damages for what it calls a wrongful termination.

EXPERT ANALYSIS

An Era Of Arctic Oil Exploration, Upended

After seven years of preparation, litigation and billions of dollars invested, Royal Dutch Shell PLC's recent decision to abandon its exploration program in the U.S. Arctic "for the foreseeable future" marks a pause — not the end — of a new era of Arctic oil and gas exploration. While oil prices weaken and dates change, litigation over the future of the Chukchi Sea rages on, say Joseph Kakesh and Steven Richardson of Wiley Rein LLP.

LEGAL INDUSTRY

Most Feared Plaintiffs Firm: Hagens Berman

Hagens Berman Sobol Shapiro LLP has risen to the peaks of plaintiff work, growing from its humble beginnings as a nine-attorney firm in Seattle to serving as co-lead counsel on giant class actions against industry leaders like Apple, Toyota and the NCAA.

Trial Ace: WilmerHale's Bill Lee

WilmerHale partner Bill Lee, one of Apple's lead attorneys in the smartphone wars, only stumbled upon patent law more than a decade into his legal career, but he learned long before that — as a high school and collegiate soccer player — that success in any competition requires a team effort.

The 5 Worst Things To Do On Cross-Exam

Stifling a witness during cross-examination or losing control of the exchange are common pitfalls that can jeopardize what is widely considered one of the most important moments of any jury trial, seasoned attorneys say. Here, Law360 looks at the five biggest mistakes attorneys make during cross-examination.

Dewey Trial Stretches On With No Sign Of A Verdict

Jury deliberations in the trial of the former executive leadership of Dewey & LeBoeuf LLP stretched into the 11th full day on Friday, with an unusually quiet panel giving no word about when the marathon larceny and fraud trial will conclude.

Legal Industry Added 4,700 Jobs In Sept., Report Says

The legal services sector rebounded from a tough summer to gain a sizable 4,700 jobs in September, according to a report on Friday by the U.S. Bureau of Labor Statistics, a figure that one expert says reflects an increase in deal work.

The NLRB Developments GCs Should Know About

The National Labor Relations Board spent its summer preparing to say goodbye to outgoing member Harry Johnson and issuing a flurry of rulings that touched on questions including what defines joint employers, student athletes and employer successors. Here, Law360 looks at the rulings that should be on GCs' radar.

Panel to debate long-awaited drought measures

After months of quiet backroom discussions, efforts to pass Western drought legislation are getting ready for prime time. Sen. Lisa Murkowski's (R-Alaska) Energy and Natural Resources Committee this week will hold a long-awaited legislative hearing on the two lead California-specific relief measures, as well as several other bills dealing with Western water issues. For lawmakers eager to put legislative fixes in place before the winter rainy season begins, the clock is ticking.

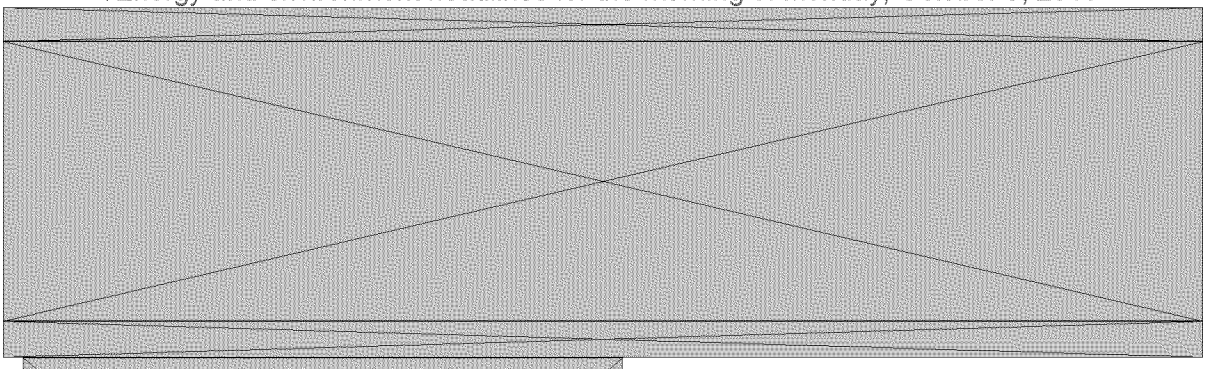
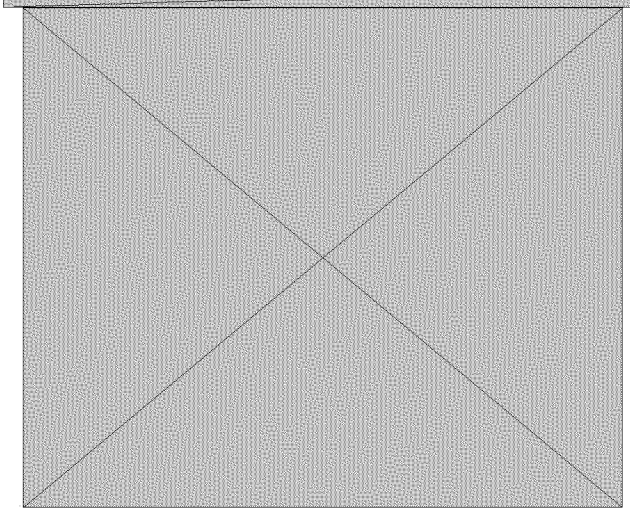
Energy and environment headlines for the morning of Monday, October 5, 2015





House set for crude export vote, collision with White House

By Kevin Rogers

The House plans to vote Friday on a bill that would end the 40-year-old ban on crude oil exports, setting the stage for a showdown with the White House.

The legislation, authored by Rep. Joe Barton, R-Texas, would end the Commerce Department policy, while retaining existing authority for the president to restrict exports during national emergencies. It would, however, prevent any new executive policies to limit

crude exports.

The House Rules Committee is set to meet on Wednesday to set floor procedure and amendment protocol for the bill ahead of Friday's vote. Any release of an official Statement of Administration Policy voicing opposition to the measure, and a potential veto threat, would coincide with that meeting.

The White House argues the Commerce Department has existing authority to allow crude exports, and the bill is "not needed."

House Republicans also are set to assail the Environmental Protection Agency's air quality rules, with separate hearings scheduled to examine both its Clean Power Plan to cut power-plant carbon and the agency's newly-finalized ozone standard.

The House Energy and Commerce Subcommittee on Energy and Power on Wednesday will feature testimony from Janet McCabe, EPA acting assistant administrator for the Office of Air and Radiation. The rules for new and existing plants, finalized in August, seek to slash power sector carbon emissions by 32 percent from 2005 levels.

In the run up to the hearing, Energy and Commerce Chairman Rep. Fred Upton, R-Mich., and Energy and Power Chairman Rep. Ed Whitfield, R-Ky., have billed the rules as the second coming of cap and trade and an effort to work around Congress, which failed to pass legislation from former Rep. Henry Waxman, D-Calif., and then-Rep. Ed Markey, D-Mass. to limit power plant carbon.

"Taken together these rules exceed 3,000 pages and effectively impose cap and trade requirements for the power sector," the lawmakers said. "Essentially, what we've got is the same scheme for power plants required under the Waxman-Markey cap and trade legislation that the administration failed to pass in Congress in 2010."

The Clean Power Plan, which would require states to develop compliance plans to reach specific targets, does not require the use of cap-and-trade systems. It does, however, give states the option to establish regional carbon exchanges as a compliance strategy.

Also on Wednesday, the House Science Subcommittees on Environment and Oversight will hold a hearing into EPA's move to lower the ground-level ozone standard to 70 parts per billion from the current 75 ppb. Announced Thursday, the rule drew ire from industry groups and environmentalists, who sparred over whether the agency went too far or didn't go far enough with its final rule.

House Science Chairman Rep. Lamar Smith, R-Texas, said the agency "did not base its new ozone standard on sound science and has failed to provide this committee with the data it uses to justify this rule."

As of Sunday, no EPA officials were scheduled to speak the hearing. Jeffrey Holmstead, former EPA assistant administrator for the Office of Air and Radiation during the Bush

administration, Michael Honeycutt of the Texas Commission on Environmental Quality, and Mark Mitchell of the National Medical Association, are set to testify.

On Thursday, the Energy and Commerce Subcommittee on Oversight and Investigations will probe allegations that Volkswagen installed technology in its diesel-powered cars to evade Clean Air Act emissions testing. The company's U.S. President and CEO Michael Horn, as well as unannounced EPA officials, are set to testify.

In the Senate, Energy Secretary Ernest Moniz is scheduled to testify Tuesday before the Energy and Natural Resources Committee on efforts to update the Strategic Petroleum Reserve, one of several department priorities outlined in its Quadrennial Energy Review. The committee included provisions to update the reserve's infrastructure in an energy reform package advanced in July.

On Wednesday, the Senate Environment and Public Works Committee will hear from the full sitting Nuclear Regulatory Commission for an oversight meeting. Chairman Steven Burns and commissioners William Ostendorff, Kristine Svinicki and Jeffrey Baran are scheduled to testify.

Upcoming Events

US, Chile to announce new marine sanctuaries at conference

By Bradley Klapper

VALPARAISO, Chile (AP) — President Barack Obama will declare new marine sanctuaries in the tidal waters of Maryland and Wisconsin's Lake Michigan Monday, while Chile is expected to block off a more than 200,000 square miles of sea from commercial fishing and oil and gas exploration in an area of the Pacific Ocean near the world-famous Easter Island.

The announcements were to be made when top officials, including U.S. Secretary of State John Kerry, attend an international conference on marine protection in the Chilean port city of Valparaiso on Monday. There, several nations also will outline plans for tracing seafood imports to combat overfishing and stem increased pollution in the ocean.

The new protected waters in the United States are the first to be designated as such in 15 years, the White House said in a statement.

The 875-square mile area of Lake Michigan extends from Port Washington to Two Rivers, containing a collection of 39 known shipwrecks. Fifteen are listed on the National Register of Historic Places.

The Mallows Bay-Potomac River in Maryland encompasses a 14-square mile area of the tidal Potomac River next to Charles County. Nearly 200 vessels, some dating back to the

Revolutionary War, are found in the largely undeveloped area that provides habitat for endangered species of wildlife and fish.

GOP battle for House speaker intensifies

By Erica Werner

WASHINGTON (AP) — House Republicans are in upheaval as their front-runner for speaker faces fresh opposition and conservatives push to postpone leadership elections.

With daunting challenges ahead, it's increasingly clear that Speaker John Boehner's resignation only deepened divisions in the fractious caucus.

GOP Rep. Jason Chaffetz of Utah announced his candidacy for speaker on Sunday, presenting himself as a new face who can unite the House in the wake of Boehner's sudden resignation last month. Boehner's deputy, Majority Leader Kevin McCarthy of California, remains the favorite, but Chaffetz's candidacy ensures there will be no coronation.

The House GOP is supposed to vote by secret ballot on Thursday, following by a floor vote in the full House later in the month.

"I can bridge that divide between our more centrist members and some of the more far-right-wing members. That's why I've entered this race," Chaffetz told "Fox News Sunday."

"The American public wants to see a change. They want a fresh start," Chaffetz said. "You don't just give an automatic promotion to the existing leadership team. That doesn't signal change."

Chaffetz, the 48-year-old chairman of the House Oversight and Government Reform Committee, has used that post to launch high-profile investigations of the Secret Service, Planned Parenthood and other issues.

His candidacy underscores chaos in the House little more than a week after Boehner, R-Ohio, announced he would resign rather than face a possible floor vote to depose him, pushed by hard-line conservatives.

More

Analysis: VW evasion likely led to dozens of deaths

By Seth Borenstein

WASHINGTON (AP) — Volkswagen's pollution-control chicanery has not just been victimless tinkering, killing between five and 20 people in the United States annually in recent years, according to an Associated Press statistical and computer analysis.

The software that the company admitted using to get around government emissions limits allowed VWs to spew enough pollution to cause somewhere between 16 and 94 deaths over seven years, with the annual count increasing more recently as more of the diesels were on the road. The total cost has been well over $100 million.

That's just in the United States. It's likely far deadlier and costlier in Europe, where more VW diesels were sold, engineers said. Scientists and experts said the death toll in Europe could be as high as hundreds each year, though they caution that it is hard to take American health and air quality computer models and translate them to a more densely populated Europe.

"Statistically, we can't point out who died because of this policy, but some people have died or likely died as a result of this," said Carnegie Mellon environmental engineer professor Peter Adams. He calculates the cost of air pollution with a sophisticated computer model that he and the AP used in its analysis.

VW pollution test site under scrutiny amid cheating scandal

By Gillian Flaccus and Justin Pritchard

OXNARD, Calif. (AP) — When Volkswagen opened its gleaming pollution testing center near the California coast, a top executive from the German automaker helped snip the blue ribbon and joined a tour of a lab so advanced that VW would brag the air inside was cleaner than in the surrounding strawberry fields.

Three years later, with VW admitting that it manipulated emissions results in 482,000 U.S. diesel vehicles to make them seem more environmentally friendly, questions are swirling around Volkswagen's only test center in North America. Was anyone at the facility complicit in the scheme? Or were VW's own testers unaware of the deception like so many others?

The center in Oxnard, about 60 miles northwest of Los Angeles, was built with the help of a $10 million, tax-exempt public bond and opened in 2012.

Volkswagen saw the facility as key to its multi-billion dollar U.S. growth strategy, partly because vehicles would have the selling point of meeting the nation's strictest emissions standards. At the facility, VW runs cars through a battery of tests to check whether they're polluting as little as advertised.

Oil following on Friday rally

By The Associated Press

Oil prices were continuing to climb Monday morning, building on a rally Friday.

Benchmark U.S. crude gained 57 cents to $46.11 per barrel in electronic trading on the New York Mercantile Exchange. The contract added 80 cents on Friday to close at $45.54.

Brent crude, used to price international oils, advanced 66 cents to $49.46 per barrel in London. On Friday, it rose 41 cents to $48.79.

A message from the American Petroleum Institute

America is now the world's #1 natural gas producer and will soon be #1 in oil. Now more than ever, abundant energy means abundant prosperity, opportunity and security for all Americans.

Federal court: Intent matters in migratory-bird deaths

By Emily Schmall

FORT WORTH, Texas (AP) — Companies accused of causing migratory bird deaths may be harder to successfully prosecute after a federal appeals court recently ruled that a century-old wildlife protection law only applies if the killing is intentional.

The decision by the 5th U.S. Circuit Court of Appeals runs contrary to two other federal courts' interpretations of the 1918 Migratory Bird Treaty Act and could save companies that operate wind farms, power transmission lines and other methods of energy production millions in research — at the risk of more bird deaths.

"If you have a dead migratory bird, you have a violation. Doesn't matter how, why or when; that's historically been the government's interpretation," said Barry Hartman of K&L Gates, a Washington law firm that represents Duke Energy Corp. "And what the court is saying is that interpretation doesn't extend to unintentional takes."

The U.S. Fish and Wildlife Service has maintained that no intent is required to violate the law, which makes it illegal to "pursue, hunt, take, capture" or "kill" more than 1,000 bird species. But companies have long claimed they should not be held responsible for actions that incidentally cause deaths — up to about a half-million annually by wind turbines alone,

the federal agency says.

Climate an issue at busy, history-making UN summit

By The Associated Press

UNITED NATIONS (AP) — The 193 member states adopted a sweeping new agenda for the next 15 years to eradicate extreme poverty and preserve the planet, during the U.N.'s 70th anniversary gathering of more than 150 world leaders last week.

Pope Francis led a major push against global warming, announcing a "right of the environment." Speaker after speaker expressed hope that the world's nations will reach a new agreement in Paris in December to tackle climate change.

Small island states, threatened by rising sea levels, raised the greatest cry. "When we feel the cool breeze of the ocean caressing us, we cannot imagine that those same waters will become our watery grave," the foreign minister of the Maldives, Dunya Maumoon, said Saturday.

More than 70 countries submitted their climate pledges during the summit, making a total of 146 states so far, General Assembly President Mogens Lykketoft announced Saturday. That included long-awaited pledges from India and Brazil.

California governor signs bill closing ivory sales loophole

By The Associated Press

SACRAMENTO, Calif. (AP) — Gov. Jerry Brown has signed a bill to close a loophole in the state's ban on importing, buying or selling elephant ivory or rhinoceros horns.

Supporters said California is a major market for ivory, and the ban would help dry up demand.

The measure by Assembly Speaker Toni Atkins, D-San Diego, aimed to end the state's exemption for selling ivory imported before 1977. She said clamping down on the illegal ivory trade would help bring an end to the poaching of elephants and rhinoceros.

"Ninety-six elephants die every day for their ivory. Elephants and rhinos are being slaughtered at a faster rate they are being born, which will result in their extinction if we don't step up," Atkins said in a statement Sunday. "The governor's signature on AB96

strengthens enforcement against the illegal ivory trade in California, which will, in turn, help put an end to poaching."

New York City explosion kills 1, hurts 3; gas leak suspected

By Jennifer Peltz

NEW YORK (AP) — The removal of a stove may have led to a gas leak that caused an explosion and fire that ripped through a three-story building in Brooklyn, killing a woman inside and injuring three passers-by, authorities said.

Firefighters received a call at about 1 p.m. Saturday reporting an explosion at a building in the Borough Park neighborhood. Emergency crews found the entire front of the building blown into the street.

Gov. Andrew Cuomo ordered the state's Department of Public Service, the agency that regulates utility companies, to launch an investigation into the cause of the apparent gas blast, which he called "the latest in a disturbing trend of incidents." He cited previous explosions in Harlem and the East Village.

Officials suspect the blast Saturday originated in an apartment on the second floor, where a tenant had recently disconnected a stove. Fire Commissioner Daniel Nigro said no one had reported smelling gas in the area.

Venezuela, Guyana restore ambassadors amid border dispute

By The Associated Press

CARACAS (AP) — Venezuela and Guyana are re-deploying their ambassadors to each other's capitals amid ongoing talks to resolve a border dispute that flared up after oil was discovered in disputed waters.

Venezuela confirmed Saturday that it sent its ambassador to the much smaller neighboring state, and accepted the Guyana's nominee for ambassador in Caracas.

Presidents of the two countries met in September for talks mediated by U.N. Secretary-General Ban Ki-moon.

The border between the South American countries was determined by international arbitration in 1899, but Venezuela has long disputed that. It claims 40 percent of Guyana's territory and extended its maritime claims this year after a subsidiary of Exxon Mobil Corp. announced an oil discovery off the coast.

NEWS UPDATE October 5, 2015

Senators push White House on ethanol mandate

By Devin Henry, The Hill • • Posted October 5, 2015

Fourteen senators — a mix of Republicans and Democrats, many from ethanol-producing Midwestern states — met with White House Chief of Staff Denis McDonough on Thursday to make their case for an aggressive new ethanol mandate under the Renewable Fuel Standard (RFS). The Environmental Protection Agency (EPA) rankled many ethanol producers in May when it proposed increasing the amount of biofuel it wants mixed into the gasoline supply, but at levels below those set by Congress in 2007. [read more …]

Pro-RFS senators meet with White House chief of staff

Amanda Reilly, E&E reporter • • Posted October 5, 2015

More than a dozen bipartisan senators Thursday met with White House Chief of Staff Denis McDonough to press for more robust yearly renewable fuel targets. At the meeting on Capitol Hill, the senators expressed concerns that a recent proposal by U.S. EPA to set targets for 2014, 2015 and 2016 underestimated the ability of producers to make ethanol and advanced biofuels. [read more …]

Senate panel rejects ethanol amendment by 15-7 vote

By Christopher Doering, Des Moines Register • • Posted October 5, 2015

The latest attempt to overhaul the country's ethanol mandate failed Thursday, but the reason for the failure depends on whom you ask. The Senate Banking Committee voted 15-7 to oppose an amendment from Sen. Pat Toomey, R-Pa., that would end the corn component of

the Renewable Fuel Standard. The measure was co-sponsored by Sen. Dianne Feinstein, D-Calif. Other attempts in Congress to end or significantly change the mandate have failed to gain momentum.

Engine Shortfall Pushed Volkswagen to Evade Emissions Testing

By JACK EWING, New York Times • • Posted October 5, 2015

Volkswagen began installing software devised to cheat on emissions tests in 2008 after realizing that a new diesel engine, developed at great expense, could not meet pollution standards in the United States and other countries, people with knowledge of the automaker's internal inquiry said on Sunday. Rather than stop production of the engine and throw out years of work and investment, managers decided to cheat, the people said, confirming a report in Bild am Sonntag, a German newspaper. [read more …]

Emissions Testing Is Broken, and Other Lessons from the VW Scandal

By Jessie Stolark, EESI • • Posted October 5, 2015

Finally, real-world fuels and emissions testing won't happen without resources. EPA will need significant resources to conduct these real-world vehicle and fuels emission tests, but everyone will benefit. First and foremost, public health and the environment will benefit. But equally important to realizing cleaner cars — automotive manufacturers will be able to sell clean cars that people actually want to buy, instead of relying on gaming the system. The technology exists to conduct real-world fuels and vehicle testing, but regulators need to have the manpower to execute these programs. A weak regulatory program benefits no one. [read more …]

Subject: Morning Consult Energy: House to Vote This Week on Lifting Crude Oil Export Ban; Russia, Saudi Arabia Won't Slow Crude Output

By Deirdra O'Regan

Today's Washington Brief

- House Republican leadership elections and budget deal negotiations will dominate discussion on Capitol Hill this week, but efforts to boost U.S. crude oil exports is also on the House agenda this week. (Morning Consult)

- The Environmental Protection Agency defended its decision to set a new national ozone standard at 70 parts per billion, the upper end of the proposed range. Health and environmental groups accused the agency of ignoring recommendations and potentially endangering the public. (E&E News)

- There was little support for fossil fuels when energy ministers from G20 countries met for the first time. Stakeholders had been trying to pitch fossil products as the only way to relieve "energy poverty" in developing countries, but the group was more focused on renewables. (Clean Technica)

Today's Business Brief

- The world's two biggest oil producers — Russia and Saudi Arabia — indicated they won't be reducing their crude output levels, despite the fact that oil prices have plummeted more than 50 percent in the past year as supplies outpace demand by about 2 million barrels per day. (The Wall Street Journal)

- Mayor Muriel Bowser (D-D.C.) shared with stakeholders a tentative agreement reached with Exelon Corp. on its $6.8 billion proposal to buy utility Pepco Holdings Inc. The draft agreement would include increased customer credits and require Exelon to establish a second headquarters in Washington. (Bloomberg News)

- Cheap natural gas prices could be stalling the installation of energy storage in the U.S., according to new research showing that when natural gas is cheaper, storage systems aren't as valuable or profitable, leading to less development. (The Washington Post)

General

The Coming Week: Gop Confronts Its Future As Debt Ceiling, Budget Loom
Will Dobbs-Allsopp, Morning Consult

Those who had hoped October would bring a brief respite from congressional shenanigans are in for a disappointment. Lawmakers are out of town for the week of Columbus Day, but the other three weeks they spend in the Capitol will be hectic.

EPA defends new ozone standard as green allies fume
Amanda Reilly, E&E

U.S. EPA is defending its choice of setting a new national ozone standard at 70 parts per billion despite blistering criticism by health and environmental groups that it won't protect the public. EPA Administrator Gina McCarthy said that, while there's no "bright line" on where a standard should be set, she based the 70 ppb limit on a review of the best available public health science.

Obama's ozone evolution
Devin Henry, The Hill

The Obama administration's decision to tighten federal ozone standards this week marked departure from the president's previous thinking on the regulations, though not as dramatic a shift as environmentalists had hoped. Four years ago, Obama disappointed public health organizations and green groups when he decided to staop the EPA's work on overhauling the standard.

Why cheap natural gas is thwarting the battery and energy storage revolution
Chris Mooney, The Washington Post

One of the major energy stories of 2015 has been the growing momentum of the so-called "energy storage" business, which burst into public view earlier this year when Tesla Motors announced a home battery product. Storage, whether through batteries or other technologies, has often been termed a game changer — if you can save energy and use it at a later time, then you can also use solar energy at night, wind energy when it's not windy, and much more.

Bill Clinton targets rural, energy issues in appeal to Democrats in coal-heavy West Virginia
Jonathan Mattise, The Associated Press

Former President Bill Clinton said Friday that struggling rural regions like coal-dependent southern West Virginia, a once-Democratic stronghold now firmly red, should be the focus of new energy investments and infrastructure improvement. In a 41-minute speech at the state Democratic Party's Jefferson-Jackson Dinner, Clinton focused more on economic woes in rural West Virginia and his home state of Arkansas than on promoting his wife.

U.S. Index Futures Climb as Fed Seen Holding Imminent Rate Rise
Roxana Zega, Bloomberg News

Standard & Poor's 500 Index E-mini contracts expiring in December rose 0.7 percent to 1,956.75 at 7:32 a.m. in New York. The S&P 500 ended last week with a gain of 1 percent, rebounding from a slide on Monday after Glencore Plc roiled global markets.

Oil & Natural Gas

Oil Gains a Second Day as U.S. Drilling Slumps to Five-Year Low
Heesu Lee Grant Smith, Bloomberg News

Oil rose for a second day in New York after the number of drilling rigs used in the U.S. slumped to a five-year low, signaling that output may slow and pare a global glut. West Texas Intermediate futures climbed as much as 1.6 percent, adding to Friday's 1.8 percent advance. The number of active rigs fell by 26 to 614 last week, according to data from oilfield-services company Baker Hughes Inc.

Russia and Saudi Arabia to Continue Pumping Oil
Georgi Kantchev and Summer Said, The Wall Street Journal

Russia and Saudi Arabia—the world's two biggest oil producers—indicated Friday they weren't pulling back from huge crude output levels that have helped send prices

tumbling. Russia said it produced oil in September at levels not seen since the fall of the Soviet Union, pumping an average of 10.74 million barrels a day, government data showed on Friday.

Russia says ready to meet OPEC, non-OPEC producers for consultations
Denis Pinchuk et al., Reuters

Russia, the world's top oil producer, is ready to meet with OPEC and non-OPEC oil producers to discuss the situation on the global oil markets if such a meeting was called, its energy minister said on Saturday. A separate meeting between Russian and Saudi officials was being planned for the end of October, to discuss energy issues and some other projects, Russian Energy Minister Alexander Novak told reporters.

Suncor Formally Begins Offer for Canadian Oil Sands for $3.29 Billion
James Herron, Bloomberg News

Suncor Energy Inc. offered to acquire all outstanding shares of Canadian Oil Sands Ltd. for about C$4.3 billion ($3.3 billion). Under the terms of the offer, each shareholder in Calgary-based Canadian Oil Sands will receive 0.25 of a Suncor share. Including the company's estimated outstanding net debt of C$2.3 billion as of June 30, the total transaction value is about C$6.6 billion, Suncor said in a statement Monday.

Exxon Gets Fine, Harsh Criticism for Negligence in Pegasus Pipeline Spill
David Hasemyer, InsideClimate News

ExxonMobil has been hit with a $2.6 million fine and harshly criticized by federal safety officials for failing to maintain an aging oil pipeline that burst two years ago in a quiet Arkansas neighborhood and sent heavy crude oil flowing through the streets. The Pipeline and Hazardous Materials Safety Administration (PHMSA) also faulted the company for its failure to spot warning signs that its 65-year-old Pegasus pipeline had structural defects.

Would green groups cut a deal to allow crude exports?
Phil Taylor and Geof Koss, E&E

Could green groups ever support legislation to lift the decades-old ban on crude exports if it included provisions to conserve public lands and wildlife, promote renewable energy or invest in low-carbon technologies? Or, would they be willing to soften their opposition?

Liquefied natural gas to take place of oil, coal?
Bill Loveless, USA Today

Now may not be the best time to unveil plans to export liquefied natural gas from the U.S. But don't tell Charles "Buddy" Roemer. The former governor of Louisiana will formally announce Monday one of the largest LNG-export proposals in the U.S., at a

time when faltering demand for gas in Asia, as well as low prices, threaten the viability of ventures much further along the way than his.

US continues to distance itself as the world leader of natural gas
Chris Pedersen, Platts

Over the last decade, the United States has firmly established itself as the world's largest natural gas producer. This significance of this is difficult to overstate, as less than a decade ago growing natural gas demand and declining production was putting the US on course to import significant amounts of gas from abroad.

U.S. Oil-Rig Count Falls to 614
Lisa Beilfuss, The Wall Street Journal

The U.S. oil-rig count dropped by 26 to 614 in the latest reporting week, extending a recent streak of declines, according to Baker Hughes Inc. The number of U.S. oil-drilling rigs, which is viewed as a proxy for activity in the oil industry, has fallen sharply since oil prices started falling last year.

Small crowd, big opposition to natural gas pipeline
Christopher Curry, The Gainesville Sun

A small, but vocal crowd turned out in Lake City Thursday evening to loudly oppose the Sabal Trail natural gas pipeline that is moving toward state and federal approval. About 30 people attended a meeting at the Columbia County High School auditorium to provide public comment on the Federal Energy Regulatory draft report on the projected environmental impact of the $3.2 billion, 515-mile, 3-foot-wide pipeline.

Utilities & Infrastructure

Exelon Said to Reach Tentative Pact with Mayor Over Pepco Deal
Mark Chediak, Bloomberg News

Washington's mayor is sharing with stakeholders a tentative agreement reached with Exelon Corp. on its $6.8 billion proposal to buy utility Pepco Holdings Inc., people with direct knowledge of the discussions said. The draft agreement, presented by Mayor Muriel Bowser's office to groups who have weighed in on the takeover before city utility regulators, would include more customer credits than Exelon and Pepco initially proposed, said the people, who asked not to be identified because the information isn't public.

Vegas Casinos Fight to Buy Their Own Electricity
Cassandra Sweet, The Wall Street Journal

Hoteliers including Wynn Resorts Ltd. , MGM Resorts International and Las Vegas

Sands Corp. , which operate more than a dozen massive gambling palaces in Nevada, say they could cut millions of dollars from their electric bills if they could buy power directly from solar farms or power-plant owners. But NV Energy, which is owned by Warren Buffett 's Berkshire Hathaway Inc., is pushing state regulators to make it very expensive for the casinos to stop buying its power.

Renewables

G20 Energy Ministers Heart Renewables, Squash "Energy Poverty" Case For Fossil Fuels
Tina Casey, Clean Technica

High-level energy ministers from G20 countries met for the first time ever last Friday, and if fossil fuel stakeholders were hoping for a show of support from that historic event, they got bupkus. While the fossil sector has been holding out cheap fossil products as the only way to relieve "energy poverty" in developing countries, at the meeting in Istanbul, Turkey, G20 ministers officially adopted a renewable energy toolkit that leads off with a program for reducing renewable energy costs among G20 countries and sharing low-cost technology around the globe.

Senators push White House on ethanol mandate
Devin Henry, The Hill

A group of senators is pushing the White House to issue a strong mandate for ethanol fuel. Fourteen senators — a mix of Republicans and Democrats, many from ethanol-producing Midwestern states — met with White House Chief of Staff Denis McDonough on Thursday to make their case for an aggressive new ethanol mandate under the Renewable Fuel Standard (RFS).

SolarCity to Make High-Efficiency Panel
Diane Cardwell, The New York Times

When SolarCity, the fast-growing provider of rooftop solar electricity systems, announced last year that it would begin making its own equipment, executives said they would focus on creating high-efficiency panels in an effort to reduce the cost of the electricity they sell. They announced on Friday that they had done just that, with a panel that converts more of the sun's energy into electricity than competing products.

Farms key to renewable energy development, feds say
Tom Lutey, Missoulian

Farms have always been hotbeds of invention, and the U.S. Department of Agriculture is hoping that a needed spark for renewable energy development will come from agriculture. "With all the great folks who live in rural America, we truly think we're going to see some things that no one even thought of before," said Lillian Salerno, USDA deputy undersecretary.

Electric Car Sales Up 1.1% In US In Sept, But The Story Is Complicated
Zachary Shahan, Clean Technica

The wait for the longer-range 2016 Nissan LEAF and 2016 Chevy Volt continues to stunt plug-in car sales growth in the US. Just about every car within the price vicinity (and especially the historically leading LEAF & Volt) saw September 2015 sales drop compared to September 2014. On the other hand, higher-priced BMW i3, Mercedes B-Class, BMW i8, and Tesla Model S models saw sales up big-time.

Coal

Too Cozy with Coal? Group Charges Feds Are Rubber-Stamping Mine Approvals
Zahra Hirji, InsideClimate News

Environmental advocates are suing federal officials, alleging they approved the expansion of four Western coal mines on public lands without adequately taking their climate impacts into account. The New Mexico-based group WildEarth Guardians is accusing the U.S. Department of the Interior of rubber-stamping coal mine expansions in Colorado, New Mexico and Wyoming without comprehensive environmental reviews.

Clinton blasts Patriot Coal bankruptcy plan
Amanda Becker, Reuters

U.S. Democratic presidential candidate Hillary Clinton said Friday that a bankruptcy plan proposed by Patriot Coal Corp. is “outrageous and must be stopped” because it diverts money intended for coal miners’ retirement benefits. “Patriot Coal is trying to take $18 million of the $22 million put aside for retired coal miners, wives and widows and use it to pay its lawyers instead,” Clinton said in a statement provided exclusively to Reuters.

South African coal miners begin strike
Joe Brock, Reuters

South African coal miners began a strike on Sunday after wage talks collapsed last week, disrupting the sector that produces the country’s electricity and exports coal to Europe and Asia. The National Union of Mineworkers (NUM), which organised the strike, said last week that it would begin from 1800 local time (1600 GMT). About 30,000 workers could take part.

Nuclear

CT nuclear plant suffers minor coolant leak
The Associated Press

The Nuclear Regulatory Commission says a leaking relief valve has caused an "unusual event" declaration at Millstone Power Station. The NRC says the incident occurred at about 9:30 a.m. Sunday at the Waterford, Connecticut plant. There were no injuries or release of radioactivity into the environment.

Climate

Alaska Seeks Federal Money to Move a Village Threatened by Climate Change
The Associated Press

One of the most eroded Native Alaskan villages on the state's coast is being considered as a possible national model for moving entire communities whose futures are threatened by natural disasters escalated by climate change. The state is hoping to kick-start an exodus from the village of Newtok, about 500 miles west of Anchorage, through a national competition for states and local governments vying for a slice of nearly $1 billion in grants to be awarded by the federal Department of Housing and Urban Development.

51 countries just released their climate plans — and they're still not strong enough
Steven Mufson, The Washington Post

When it comes to slowing climate change, it takes more than a village. On Wednesday and Thursday, 51 countries filed their climate action plans with the United Nations, a key step toward reaching an international accord at the Paris climate summit in December. Altogether, more than 130 nations accounting for about 85 percent of global greenhouse gas emissions have filed plans.

Opinions, Editorials & Perspectives

Shell's Decision to Suspend Arctic Activities: Retreat or Pause?
Randall Luthi, Morning Consult

Shell expended over $7 billion on this "dry hole". In addition, they have battled transportation mishaps, expensive renovations to drill ships, Green Peace hounding their every move, and an exploration plan unnecessarily crimped by Federal regulations.

Enemies of the Sun
Paul Krugman, The New York Times

While it's true that fracking has led to a boom in U.S. gas and oil production, we're also living in an era of spectacular progress in wind and solar energy. Why has the right become so hostile to technologies that look more and more like the wave of the future?

When economics get lost in the smog

Michael A. Livermore and Richard L. Revesz, The Hill

This week, the U.S. Environmental Protection Agency (EPA) revised its air quality standard for smog (or ground-level ozone), meeting, by a matter of hours, a court-ordered deadline to do so. The EPA tightened the existing standard of 75 parts per billion (ppb), set by the George W. Bush administration, to 70 ppb, the least stringent of the revisions it was considering.

Bill Gates Making Progress On Next Generation Of Nuclear Power — In China
James Conca, Forbes

Bill Gates' nuclear power company, TerraPower, signed an agreement with the China National Nuclear Corporation (CNNC) allowing the two companies to collaborate on advanced nuclear technologies that address safety, environmental and cost issues. The MOU was signed by TerraPower CEO Lee McIntire and CNNC President Qian Zhimin, as Washington's Lieutenant Governor Brad Owen and Bill Gates looked on.

How Shale Reduced U.S. Energy Risks from Hurricanes
Geoffrey Styles, The Energy Collective

Just in time for the 10-year anniversary of Hurricane Katrina last month, the US Energy Information Administration (EIA) reported on the reduced vulnerability of US energy supplies to Atlantic hurricanes, as a result of the energy shifts of the last decade. As the Houston Chronicle noted, this illustrates another benefit of the revolution in shale oil and gas. However, with oil still below $50 per barrel, it is also worth considering how durable these particular effects might be if low oil prices were to persist much longer.

The time has come for offshore wind power in the United States
Jeremy Firestone et al., PNAS

Europe went from 622 megawatts of offshore wind capacity in 2004 to more than 8,000 in 2014 across 74 wind projects, with those under construction to increase capacity to almost 11,000 megawatts. United States offshore wind has so far remained a missed opportunity, given its huge resource size and proximity to population centers, the magnitude of the climate change problem, and the public's hunger for a transformative energy policy with offshore wind as part of the vanguard.

Research Reports, Issue Briefs & Case Studies

Is inexpensive natural gas hindering the grid energy storage industry?
Eric Hittinger and Roger Lueken, Science Direct

Grid energy storage is a maturing technology and forecasts of the industry's growth have been promising. However, recent years have realized little growth in actual deployments of grid-level storage and several high-profile storage companies and projects have failed.

Subject: Morning Consult Energy: House to Vote This Week on Lifting Crude Oil Export Ban; Russia, Saudi Arabia Won't Slow Crude Output

By Deirdra O'Regan

Today's Washington Brief

- House Republican leadership elections and budget deal negotiations will dominate discussion on Capitol Hill this week, but efforts to boost U.S. crude oil exports is also on the House agenda this week. (Morning Consult)

- The Environmental Protection Agency defended its decision to set a new national ozone standard at 70 parts per billion, the upper end of the proposed range. Health and environmental groups accused the agency of ignoring recommendations and potentially endangering the public. (E&E News)

- There was little support for fossil fuels when energy ministers from G20 countries met for the first time. Stakeholders had been trying to pitch fossil products as the only way to relieve "energy poverty" in developing countries, but the group was more focused on renewables. (Clean Technica)

Today's Business Brief

- The world's two biggest oil producers — Russia and Saudi Arabia — indicated they won't be reducing their crude output levels, despite the fact that oil prices have plummeted more than 50 percent in the past year as supplies outpace demand by about 2 million barrels per day. (The Wall Street Journal)

- Mayor Muriel Bowser (D-D.C.) shared with stakeholders a tentative agreement reached with Exelon Corp. on its $6.8 billion proposal to buy utility Pepco Holdings Inc. The draft agreement would include increased customer credits and require Exelon to establish a second headquarters in Washington. (Bloomberg News)

- Cheap natural gas prices could be stalling the installation of energy storage in the U.S., according to new research showing that when natural gas is cheaper, storage systems aren't as valuable or profitable, leading to less development. (The Washington Post)

General

The Coming Week: Gop Confronts Its Future As Debt Ceiling, Budget Loom
Will Dobbs-Allsopp, Morning Consult

Those who had hoped October would bring a brief respite from congressional shenanigans are in for a disappointment. Lawmakers are out of town for the week of Columbus Day, but the other three weeks they spend in the Capitol will be hectic.

EPA defends new ozone standard as green allies fume
Amanda Reilly, E&E

U.S. EPA is defending its choice of setting a new national ozone standard at 70 parts per billion despite blistering criticism by health and environmental groups that it won't protect the public. EPA Administrator Gina McCarthy said that, while there's no "bright line" on where a standard should be set, she based the 70 ppb limit on a review of the best available public health science.

Obama's ozone evolution
Devin Henry, The Hill

The Obama administration's decision to tighten federal ozone standards this week marked departure from the president's previous thinking on the regulations, though not as dramatic a shift as environmentalists had hoped. Four years ago, Obama disappointed public health organizations and green groups when he decided to staop the EPA's work on overhauling the standard.

Why cheap natural gas is thwarting the battery and energy storage revolution
Chris Mooney, The Washington Post

One of the major energy stories of 2015 has been the growing momentum of the so-called "energy storage" business, which burst into public view earlier this year when Tesla Motors announced a home battery product. Storage, whether through batteries or other technologies, has often been termed a game changer — if you can save energy and use it at a later time, then you can also use solar energy at night, wind energy when it's not windy, and much more.

Bill Clinton targets rural, energy issues in appeal to Democrats in coal-heavy West Virginia
Jonathan Mattise, The Associated Press

Former President Bill Clinton said Friday that struggling rural regions like coal-dependent southern West Virginia, a once-Democratic stronghold now firmly red, should be the focus of new energy investments and infrastructure improvement. In a 41-minute speech at the state Democratic Party's Jefferson-Jackson Dinner, Clinton focused more on economic woes in rural West Virginia and his home state of Arkansas than on promoting his wife.

U.S. Index Futures Climb as Fed Seen Holding Imminent Rate Rise
Roxana Zega, Bloomberg News

Standard & Poor's 500 Index E-mini contracts expiring in December rose 0.7 percent to 1,956.75 at 7:32 a.m. in New York. The S&P 500 ended last week with a gain of 1 percent, rebounding from a slide on Monday after Glencore Plc roiled global markets.

Oil & Natural Gas

Oil Gains a Second Day as U.S. Drilling Slumps to Five-Year Low
Heesu Lee Grant Smith, Bloomberg News

Oil rose for a second day in New York after the number of drilling rigs used in the U.S. slumped to a five-year low, signaling that output may slow and pare a global glut. West Texas Intermediate futures climbed as much as 1.6 percent, adding to Friday's 1.8 percent advance. The number of active rigs fell by 26 to 614 last week, according to data from oilfield-services company Baker Hughes Inc.

Russia and Saudi Arabia to Continue Pumping Oil
Georgi Kantchev and Summer Said, The Wall Street Journal

Russia and Saudi Arabia—the world's two biggest oil producers—indicated Friday they weren't pulling back from huge crude output levels that have helped send prices

tumbling. Russia said it produced oil in September at levels not seen since the fall of the Soviet Union, pumping an average of 10.74 million barrels a day, government data showed on Friday.

Russia says ready to meet OPEC, non-OPEC producers for consultations
Denis Pinchuk et al., Reuters

Russia, the world's top oil producer, is ready to meet with OPEC and non-OPEC oil producers to discuss the situation on the global oil markets if such a meeting was called, its energy minister said on Saturday. A separate meeting between Russian and Saudi officials was being planned for the end of October, to discuss energy issues and some other projects, Russian Energy Minister Alexander Novak told reporters.

Suncor Formally Begins Offer for Canadian Oil Sands for $3.29 Billion
James Herron, Bloomberg News

Suncor Energy Inc. offered to acquire all outstanding shares of Canadian Oil Sands Ltd. for about C$4.3 billion ($3.3 billion). Under the terms of the offer, each shareholder in Calgary-based Canadian Oil Sands will receive 0.25 of a Suncor share. Including the company's estimated outstanding net debt of C$2.3 billion as of June 30, the total transaction value is about C$6.6 billion, Suncor said in a statement Monday.

Exxon Gets Fine, Harsh Criticism for Negligence in Pegasus Pipeline Spill
David Hasemyer, InsideClimate News

ExxonMobil has been hit with a $2.6 million fine and harshly criticized by federal safety officials for failing to maintain an aging oil pipeline that burst two years ago in a quiet Arkansas neighborhood and sent heavy crude oil flowing through the streets. The Pipeline and Hazardous Materials Safety Administration (PHMSA) also faulted the company for its failure to spot warning signs that its 65-year-old Pegasus pipeline had structural defects.

Would green groups cut a deal to allow crude exports?
Phil Taylor and Geof Koss, E&E

Could green groups ever support legislation to lift the decades-old ban on crude exports if it included provisions to conserve public lands and wildlife, promote renewable energy or invest in low-carbon technologies? Or, would they be willing to soften their opposition?

Liquefied natural gas to take place of oil, coal?
Bill Loveless, USA Today

Now may not be the best time to unveil plans to export liquefied natural gas from the U.S. But don't tell Charles "Buddy" Roemer. The former governor of Louisiana will formally announce Monday one of the largest LNG-export proposals in the U.S., at a

time when faltering demand for gas in Asia, as well as low prices, threaten the viability of ventures much further along the way than his.

US continues to distance itself as the world leader of natural gas
Chris Pedersen, Platts

Over the last decade, the United States has firmly established itself as the world's largest natural gas producer. This significance of this is difficult to overstate, as less than a decade ago growing natural gas demand and declining production was putting the US on course to import significant amounts of gas from abroad.

U.S. Oil-Rig Count Falls to 614
Lisa Beilfuss, The Wall Street Journal

The U.S. oil-rig count dropped by 26 to 614 in the latest reporting week, extending a recent streak of declines, according to Baker Hughes Inc. The number of U.S. oil-drilling rigs, which is viewed as a proxy for activity in the oil industry, has fallen sharply since oil prices started falling last year.

Small crowd, big opposition to natural gas pipeline
Christopher Curry, The Gainesville Sun

A small, but vocal crowd turned out in Lake City Thursday evening to loudly oppose the Sabal Trail natural gas pipeline that is moving toward state and federal approval. About 30 people attended a meeting at the Columbia County High School auditorium to provide public comment on the Federal Energy Regulatory draft report on the projected environmental impact of the $3.2 billion, 515-mile, 3-foot-wide pipeline.

Utilities & Infrastructure

Exelon Said to Reach Tentative Pact with Mayor Over Pepco Deal
Mark Chediak, Bloomberg News

Washington's mayor is sharing with stakeholders a tentative agreement reached with Exelon Corp. on its $6.8 billion proposal to buy utility Pepco Holdings Inc., people with direct knowledge of the discussions said. The draft agreement, presented by Mayor Muriel Bowser's office to groups who have weighed in on the takeover before city utility regulators, would include more customer credits than Exelon and Pepco initially proposed, said the people, who asked not to be identified because the information isn't public.

Vegas Casinos Fight to Buy Their Own Electricity
Cassandra Sweet, The Wall Street Journal

Hoteliers including Wynn Resorts Ltd. , MGM Resorts International and Las Vegas

Sands Corp. , which operate more than a dozen massive gambling palaces in Nevada, say they could cut millions of dollars from their electric bills if they could buy power directly from solar farms or power-plant owners. But NV Energy, which is owned by Warren Buffett 's Berkshire Hathaway Inc., is pushing state regulators to make it very expensive for the casinos to stop buying its power.

Renewables

G20 Energy Ministers Heart Renewables, Squash "Energy Poverty" Case For Fossil Fuels
Tina Casey, Clean Technica

High-level energy ministers from G20 countries met for the first time ever last Friday, and if fossil fuel stakeholders were hoping for a show of support from that historic event, they got bupkus. While the fossil sector has been holding out cheap fossil products as the only way to relieve "energy poverty" in developing countries, at the meeting in Istanbul, Turkey, G20 ministers officially adopted a renewable energy toolkit that leads off with a program for reducing renewable energy costs among G20 countries and sharing low-cost technology around the globe.

Senators push White House on ethanol mandate
Devin Henry, The Hill

A group of senators is pushing the White House to issue a strong mandate for ethanol fuel. Fourteen senators — a mix of Republicans and Democrats, many from ethanol-producing Midwestern states — met with White House Chief of Staff Denis McDonough on Thursday to make their case for an aggressive new ethanol mandate under the Renewable Fuel Standard (RFS).

SolarCity to Make High-Efficiency Panel
Diane Cardwell, The New York Times

When SolarCity, the fast-growing provider of rooftop solar electricity systems, announced last year that it would begin making its own equipment, executives said they would focus on creating high-efficiency panels in an effort to reduce the cost of the electricity they sell. They announced on Friday that they had done just that, with a panel that converts more of the sun's energy into electricity than competing products.

Farms key to renewable energy development, feds say
Tom Lutey, Missoulian

Farms have always been hotbeds of invention, and the U.S. Department of Agriculture is hoping that a needed spark for renewable energy development will come from agriculture. "With all the great folks who live in rural America, we truly think we're going to see some things that no one even thought of before," said Lillian Salerno, USDA deputy undersecretary.

Electric Car Sales Up 1.1% In US In Sept, But The Story Is Complicated
Zachary Shahan, Clean Technica

The wait for the longer-range 2016 Nissan LEAF and 2016 Chevy Volt continues to stunt plug-in car sales growth in the US. Just about every car within the price vicinity (and especially the historically leading LEAF & Volt) saw September 2015 sales drop compared to September 2014. On the other hand, higher-priced BMW i3, Mercedes B-Class, BMW i8, and Tesla Model S models saw sales up big-time.

Coal

Too Cozy with Coal? Group Charges Feds Are Rubber-Stamping Mine Approvals
Zahra Hirji, InsideClimate News

Environmental advocates are suing federal officials, alleging they approved the expansion of four Western coal mines on public lands without adequately taking their climate impacts into account. The New Mexico-based group WildEarth Guardians is accusing the U.S. Department of the Interior of rubber-stamping coal mine expansions in Colorado, New Mexico and Wyoming without comprehensive environmental reviews.

Clinton blasts Patriot Coal bankruptcy plan
Amanda Becker, Reuters

U.S. Democratic presidential candidate Hillary Clinton said Friday that a bankruptcy plan proposed by Patriot Coal Corp. is “outrageous and must be stopped” because it diverts money intended for coal miners’ retirement benefits. “Patriot Coal is trying to take $18 million of the $22 million put aside for retired coal miners, wives and widows and use it to pay its lawyers instead,” Clinton said in a statement provided exclusively to Reuters.

South African coal miners begin strike
Joe Brock, Reuters

South African coal miners began a strike on Sunday after wage talks collapsed last week, disrupting the sector that produces the country’s electricity and exports coal to Europe and Asia. The National Union of Mineworkers (NUM), which organised the strike, said last week that it would begin from 1800 local time (1600 GMT). About 30,000 workers could take part.

Nuclear

CT nuclear plant suffers minor coolant leak
The Associated Press

The Nuclear Regulatory Commission says a leaking relief valve has caused an "unusual event" declaration at Millstone Power Station. The NRC says the incident occurred at about 9:30 a.m. Sunday at the Waterford, Connecticut plant. There were no injuries or release of radioactivity into the environment.

Climate

Alaska Seeks Federal Money to Move a Village Threatened by Climate Change
The Associated Press

One of the most eroded Native Alaskan villages on the state's coast is being considered as a possible national model for moving entire communities whose futures are threatened by natural disasters escalated by climate change. The state is hoping to kick-start an exodus from the village of Newtok, about 500 miles west of Anchorage, through a national competition for states and local governments vying for a slice of nearly $1 billion in grants to be awarded by the federal Department of Housing and Urban Development.

51 countries just released their climate plans — and they're still not strong enough
Steven Mufson, The Washington Post

When it comes to slowing climate change, it takes more than a village. On Wednesday and Thursday, 51 countries filed their climate action plans with the United Nations, a key step toward reaching an international accord at the Paris climate summit in December. Altogether, more than 130 nations accounting for about 85 percent of global greenhouse gas emissions have filed plans.

Opinions, Editorials & Perspectives

Shell's Decision to Suspend Arctic Activities: Retreat or Pause?
Randall Luthi, Morning Consult

Shell expended over $7 billion on this "dry hole". In addition, they have battled transportation mishaps, expensive renovations to drill ships, Green Peace hounding their every move, and an exploration plan unnecessarily crimped by Federal regulations.

Enemies of the Sun
Paul Krugman, The New York Times

While it's true that fracking has led to a boom in U.S. gas and oil production, we're also living in an era of spectacular progress in wind and solar energy. Why has the right become so hostile to technologies that look more and more like the wave of the future?

When economics get lost in the smog

Michael A. Livermore and Richard L. Revesz, The Hill

This week, the U.S. Environmental Protection Agency (EPA) revised its air quality standard for smog (or ground-level ozone), meeting, by a matter of hours, a court-ordered deadline to do so. The EPA tightened the existing standard of 75 parts per billion (ppb), set by the George W. Bush administration, to 70 ppb, the least stringent of the revisions it was considering.

Bill Gates Making Progress On Next Generation Of Nuclear Power — In China

USEA annual energy supply forum @ 9 a.m.
Sen. Energy & Nat. Resources hearing on six bills @ 9:30 a.m.
House E&C Oversight and Investigations Subcommittee hearing on Volkswagen's emissions scandal @ 10 a.m.
House Small Business Investigations, Oversight and Regulations Subcommittee hearing on DOL's overtime rule @ 10 a.m.
Clean Energy States Alliance webinar on fuel cells for educational facilities @ 1 p.m.
Sen. Energy & Nat. Resources Public Lands, Forests and Mining Subcommittee legislative hearing @ 2:30 p.m.
EESI webinar on energy efficiency in Iowa @ 2:30 p.m.

Friday
Society of Environmental Journalists annual conference @ 9 a.m.
NRC Advisory Committee on Reactor Safeguards meeting @ 8:30 a.m.
CATO talk on regressive regulation to boost U.S. economic growth @ 12 p.m.

General

The Coming Week: Gop Confronts Its Future As Debt Ceiling, Budget Loom
Will Dobbs-Allsopp, Morning Consult

Those who had hoped October would bring a brief respite from congressional shenanigans are in for a disappointment. Lawmakers are out of town for the week of Columbus Day, but the other three weeks they spend in the Capitol will be hectic.

EPA defends new ozone standard as green allies fume
Amanda Reilly, E&E

U.S. EPA is defending its choice of setting a new national ozone standard at 70 parts per billion despite blistering criticism by health and environmental groups that it won't protect the public. EPA Administrator Gina McCarthy said that, while there's no "bright line" on where a standard should be set, she based the 70 ppb limit on a review of the best available public health science.

Obama's ozone evolution
Devin Henry, The Hill

The Obama administration's decision to tighten federal ozone standards this week marked departure from the president's previous thinking on the regulations, though not as dramatic a shift as environmentalists had hoped. Four years ago, Obama disappointed public health organizations and green groups when he decided to staop the EPA's work on overhauling the standard.

Why cheap natural gas is thwarting the battery and energy storage revolution
Chris Mooney, The Washington Post

One of the major energy stories of 2015 has been the growing momentum of the so-called "energy storage" business, which burst into public view earlier this year when Tesla Motors announced a home battery product. Storage, whether through batteries or other technologies, has often been termed a game changer — if you can save energy and use it at a later time, then you can also use solar energy at night, wind energy when it's not windy, and much more.

Bill Clinton targets rural, energy issues in appeal to Democrats in coal-heavy West Virginia
Jonathan Mattise, The Associated Press

Former President Bill Clinton said Friday that struggling rural regions like coal-dependent southern West Virginia, a once-Democratic stronghold now firmly red, should be the focus of new energy investments and infrastructure improvement. In a 41-minute speech at the state Democratic Party's Jefferson-Jackson Dinner, Clinton focused more on economic woes in rural West Virginia and his home state of Arkansas than on promoting his wife.

U.S. Index Futures Climb as Fed Seen Holding Imminent Rate Rise
Roxana Zega, Bloomberg News

Standard & Poor's 500 Index E-mini contracts expiring in December rose 0.7 percent to 1,956.75 at 7:32 a.m. in New York. The S&P 500 ended last week with a gain of 1 percent, rebounding from a slide on Monday after Glencore Plc roiled global markets.

Oil & Natural Gas

Oil Gains a Second Day as U.S. Drilling Slumps to Five-Year Low
Heesu Lee Grant Smith, Bloomberg News

Oil rose for a second day in New York after the number of drilling rigs used in the U.S. slumped to a five-year low, signaling that output may slow and pare a global glut. West Texas Intermediate futures climbed as much as 1.6 percent, adding to Friday's 1.8 percent advance. The number of active rigs fell by 26 to 614 last week, according to data from oilfield-services company Baker Hughes Inc.

Russia and Saudi Arabia to Continue Pumping Oil
Georgi Kantchev and Summer Said, The Wall Street Journal

Russia and Saudi Arabia—the world's two biggest oil producers—indicated Friday they weren't pulling back from huge crude output levels that have helped send prices

tumbling. Russia said it produced oil in September at levels not seen since the fall of the Soviet Union, pumping an average of 10.74 million barrels a day, government data showed on Friday.

Russia says ready to meet OPEC, non-OPEC producers for consultations
Denis Pinchuk et al., Reuters

Russia, the world's top oil producer, is ready to meet with OPEC and non-OPEC oil producers to discuss the situation on the global oil markets if such a meeting was called, its energy minister said on Saturday. A separate meeting between Russian and Saudi officials was being planned for the end of October, to discuss energy issues and some other projects, Russian Energy Minister Alexander Novak told reporters.

Suncor Formally Begins Offer for Canadian Oil Sands for $3.29 Billion
James Herron, Bloomberg News

Suncor Energy Inc. offered to acquire all outstanding shares of Canadian Oil Sands Ltd. for about C$4.3 billion ($3.3 billion). Under the terms of the offer, each shareholder in Calgary-based Canadian Oil Sands will receive 0.25 of a Suncor share. Including the company's estimated outstanding net debt of C$2.3 billion as of June 30, the total transaction value is about C$6.6 billion, Suncor said in a statement Monday.

Exxon Gets Fine, Harsh Criticism for Negligence in Pegasus Pipeline Spill
David Hasemyer, InsideClimate News

ExxonMobil has been hit with a $2.6 million fine and harshly criticized by federal safety officials for failing to maintain an aging oil pipeline that burst two years ago in a quiet Arkansas neighborhood and sent heavy crude oil flowing through the streets. The Pipeline and Hazardous Materials Safety Administration (PHMSA) also faulted the company for its failure to spot warning signs that its 65-year-old Pegasus pipeline had structural defects.

Would green groups cut a deal to allow crude exports?
Phil Taylor and Geof Koss, E&E

Could green groups ever support legislation to lift the decades-old ban on crude exports if it included provisions to conserve public lands and wildlife, promote renewable energy or invest in low-carbon technologies? Or, would they be willing to soften their opposition?

Liquefied natural gas to take place of oil, coal?
Bill Loveless, USA Today

Now may not be the best time to unveil plans to export liquefied natural gas from the U.S. But don't tell Charles "Buddy" Roemer. The former governor of Louisiana will formally announce Monday one of the largest LNG-export proposals in the U.S., at a

time when faltering demand for gas in Asia, as well as low prices, threaten the viability of ventures much further along the way than his.

US continues to distance itself as the world leader of natural gas
Chris Pedersen, Platts

Over the last decade, the United States has firmly established itself as the world's largest natural gas producer. This significance of this is difficult to overstate, as less than a decade ago growing natural gas demand and declining production was putting the US on course to import significant amounts of gas from abroad.

U.S. Oil-Rig Count Falls to 614
Lisa Beilfuss, The Wall Street Journal

The U.S. oil-rig count dropped by 26 to 614 in the latest reporting week, extending a recent streak of declines, according to Baker Hughes Inc. The number of U.S. oil-drilling rigs, which is viewed as a proxy for activity in the oil industry, has fallen sharply since oil prices started falling last year.

Small crowd, big opposition to natural gas pipeline
Christopher Curry, The Gainesville Sun

A small, but vocal crowd turned out in Lake City Thursday evening to loudly oppose the Sabal Trail natural gas pipeline that is moving toward state and federal approval. About 30 people attended a meeting at the Columbia County High School auditorium to provide public comment on the Federal Energy Regulatory draft report on the projected environmental impact of the $3.2 billion, 515-mile, 3-foot-wide pipeline.

Utilities & Infrastructure

Exelon Said to Reach Tentative Pact with Mayor Over Pepco Deal
Mark Chediak, Bloomberg News

Washington's mayor is sharing with stakeholders a tentative agreement reached with Exelon Corp. on its $6.8 billion proposal to buy utility Pepco Holdings Inc., people with direct knowledge of the discussions said. The draft agreement, presented by Mayor Muriel Bowser's office to groups who have weighed in on the takeover before city utility regulators, would include more customer credits than Exelon and Pepco initially proposed, said the people, who asked not to be identified because the information isn't public.

Vegas Casinos Fight to Buy Their Own Electricity
Cassandra Sweet, The Wall Street Journal

Hoteliers including Wynn Resorts Ltd. , MGM Resorts International and Las Vegas

Sands Corp. , which operate more than a dozen massive gambling palaces in Nevada, say they could cut millions of dollars from their electric bills if they could buy power directly from solar farms or power-plant owners. But NV Energy, which is owned by Warren Buffett 's Berkshire Hathaway Inc., is pushing state regulators to make it very expensive for the casinos to stop buying its power.

Renewables

G20 Energy Ministers Heart Renewables, Squash "Energy Poverty" Case For Fossil Fuels
Tina Casey, Clean Technica

High-level energy ministers from G20 countries met for the first time ever last Friday, and if fossil fuel stakeholders were hoping for a show of support from that historic event, they got bupkus. While the fossil sector has been holding out cheap fossil products as the only way to relieve "energy poverty" in developing countries, at the meeting in Istanbul, Turkey, G20 ministers officially adopted a renewable energy toolkit that leads off with a program for reducing renewable energy costs among G20 countries and sharing low-cost technology around the globe.

Senators push White House on ethanol mandate
Devin Henry, The Hill

A group of senators is pushing the White House to issue a strong mandate for ethanol fuel. Fourteen senators — a mix of Republicans and Democrats, many from ethanol-producing Midwestern states — met with White House Chief of Staff Denis McDonough on Thursday to make their case for an aggressive new ethanol mandate under the Renewable Fuel Standard (RFS).

SolarCity to Make High-Efficiency Panel
Diane Cardwell, The New York Times

When SolarCity, the fast-growing provider of rooftop solar electricity systems, announced last year that it would begin making its own equipment, executives said they would focus on creating high-efficiency panels in an effort to reduce the cost of the electricity they sell. They announced on Friday that they had done just that, with a panel that converts more of the sun's energy into electricity than competing products.

Farms key to renewable energy development, feds say
Tom Lutey, Missoulian

Farms have always been hotbeds of invention, and the U.S. Department of Agriculture is hoping that a needed spark for renewable energy development will come from agriculture. "With all the great folks who live in rural America, we truly think we're going to see some things that no one even thought of before," said Lillian Salerno, USDA deputy undersecretary.

Electric Car Sales Up 1.1% In US In Sept, But The Story Is Complicated
Zachary Shahan, Clean Technica

The wait for the longer-range 2016 Nissan LEAF and 2016 Chevy Volt continues to stunt plug-in car sales growth in the US. Just about every car within the price vicinity (and especially the historically leading LEAF & Volt) saw September 2015 sales drop compared to September 2014. On the other hand, higher-priced BMW i3, Mercedes B-Class, BMW i8, and Tesla Model S models saw sales up big-time.

Coal

Too Cozy with Coal? Group Charges Feds Are Rubber-Stamping Mine Approvals
Zahra Hirji, InsideClimate News

Environmental advocates are suing federal officials, alleging they approved the expansion of four Western coal mines on public lands without adequately taking their climate impacts into account. The New Mexico-based group WildEarth Guardians is accusing the U.S. Department of the Interior of rubber-stamping coal mine expansions in Colorado, New Mexico and Wyoming without comprehensive environmental reviews.

Clinton blasts Patriot Coal bankruptcy plan
Amanda Becker, Reuters

U.S. Democratic presidential candidate Hillary Clinton said Friday that a bankruptcy plan proposed by Patriot Coal Corp. is “outrageous and must be stopped” because it diverts money intended for coal miners’ retirement benefits. “Patriot Coal is trying to take $18 million of the $22 million put aside for retired coal miners, wives and widows and use it to pay its lawyers instead,” Clinton said in a statement provided exclusively to Reuters.

South African coal miners begin strike
Joe Brock, Reuters

South African coal miners began a strike on Sunday after wage talks collapsed last week, disrupting the sector that produces the country’s electricity and exports coal to Europe and Asia. The National Union of Mineworkers (NUM), which organised the strike, said last week that it would begin from 1800 local time (1600 GMT). About 30,000 workers could take part.

Nuclear

CT nuclear plant suffers minor coolant leak
The Associated Press

The Nuclear Regulatory Commission says a leaking relief valve has caused an "unusual event" declaration at Millstone Power Station. The NRC says the incident occurred at about 9:30 a.m. Sunday at the Waterford, Connecticut plant. There were no injuries or release of radioactivity into the environment.

Climate

Alaska Seeks Federal Money to Move a Village Threatened by Climate Change
The Associated Press

One of the most eroded Native Alaskan villages on the state's coast is being considered as a possible national model for moving entire communities whose futures are threatened by natural disasters escalated by climate change. The state is hoping to kick-start an exodus from the village of Newtok, about 500 miles west of Anchorage, through a national competition for states and local governments vying for a slice of nearly $1 billion in grants to be awarded by the federal Department of Housing and Urban Development.

51 countries just released their climate plans — and they're still not strong enough
Steven Mufson, The Washington Post

When it comes to slowing climate change, it takes more than a village. On Wednesday and Thursday, 51 countries filed their climate action plans with the United Nations, a key step toward reaching an international accord at the Paris climate summit in December. Altogether, more than 130 nations accounting for about 85 percent of global greenhouse gas emissions have filed plans.

Opinions, Editorials & Perspectives

Shell's Decision to Suspend Arctic Activities: Retreat or Pause?
Randall Luthi, Morning Consult

Shell expended over $7 billion on this "dry hole". In addition, they have battled transportation mishaps, expensive renovations to drill ships, Green Peace hounding their every move, and an exploration plan unnecessarily crimped by Federal regulations.

Enemies of the Sun
Paul Krugman, The New York Times

While it's true that fracking has led to a boom in U.S. gas and oil production, we're also living in an era of spectacular progress in wind and solar energy. Why has the right become so hostile to technologies that look more and more like the wave of the future?

When economics get lost in the smog

Michael A. Livermore and Richard L. Revesz, The Hill

This week, the U.S. Environmental Protection Agency (EPA) revised its air quality standard for smog (or ground-level ozone), meeting, by a matter of hours, a court-ordered deadline to do so. The EPA tightened the existing standard of 75 parts per billion (ppb), set by the George W. Bush administration, to 70 ppb, the least stringent of the revisions it was considering.

Bill Gates Making Progress On Next Generation Of Nuclear Power — In China
James Conca, Forbes

Bill Gates' nuclear power company, TerraPower, signed an agreement with the China National Nuclear Corporation (CNNC) allowing the two companies to collaborate on advanced nuclear technologies that address safety, environmental and cost issues. The MOU was signed by TerraPower CEO Lee McIntire and CNNC President Qian Zhimin, as Washington's Lieutenant Governor Brad Owen and Bill Gates looked on.

How Shale Reduced U.S. Energy Risks from Hurricanes
Geoffrey Styles, The Energy Collective

Just in time for the 10-year anniversary of Hurricane Katrina last month, the US Energy Information Administration (EIA) reported on the reduced vulnerability of US energy supplies to Atlantic hurricanes, as a result of the energy shifts of the last decade. As the Houston Chronicle noted, this illustrates another benefit of the revolution in shale oil and gas. However, with oil still below $50 per barrel, it is also worth considering how durable these particular effects might be if low oil prices were to persist much longer.

The time has come for offshore wind power in the United States
Jeremy Firestone et al., PNAS

Europe went from 622 megawatts of offshore wind capacity in 2004 to more than 8,000 in 2014 across 74 wind projects, with those under construction to increase capacity to almost 11,000 megawatts. United States offshore wind has so far remained a missed opportunity, given its huge resource size and proximity to population centers, the magnitude of the climate change problem, and the public's hunger for a transformative energy policy with offshore wind as part of the vanguard.

Research Reports, Issue Briefs & Case Studies

Is inexpensive natural gas hindering the grid energy storage industry?
Eric Hittinger and Roger Lueken, Science Direct

Grid energy storage is a maturing technology and forecasts of the industry's growth have been promising. However, recent years have realized little growth in actual deployments of grid-level storage and several high-profile storage companies and projects have failed.

Subject: EPA results for Charge depleting tests

Hi Jim,

As a follow up to your phone message and discussion you had with Mike Giles on Friday concerning charge depleting data, the EPA fuel economy label calculator requires electrical measurements and exhaust measurements for each of the cycles or bags. The problem we see is that the EPA electrical measurements were only taken for each of the 6 cycles, where the exhaust measurements were provided for 12 bags (2 bags for each cycle) creating an apples to oranges scenario. We are requesting that EPA provide us the exhaust bag data weighted into 6 cycles so we can use this in the EPA calculator. It would be very cumbersome and mistake prone for us to do manually from the pdf's.

Regards,

Bill Rodgers

Requesting Meeting/Conference Call with: **Christopher Grundler**
Send form to: Gwen Stewart - 202 564-1682

Date of this Request: 10/2/15

Point of Contact (Name/Number): Tia Sutton, (202) 564-8929

Title of Meeting: Prep and Mock Hearing for VW HEC Hearing

Purpose of Meeting: To prepare Chris and Phil Brooks (OECA) for the House Energy and Commerce Committee hearing on Thursday, October 8th.

Priority Status: Critical or time sensitive __X___ Less Immediate _____

Last possible date for meeting:
Chris has requested that this meeting be held on **Tuesday, Oct. 6th**.

If the meeting is critical, please explain why:

Chris and Phil will be testifying/serving as EPA witnesses at a Congressional hearing on Thursday; this meeting will be to prep them and go over materials.

Location of Meeting: Chris' conference rooms in DC and Ann Arbor

Length of Meeting: 60 min.

Key Participants: (List all who need to be notified of the meeting)

Subject: "Real World Impact"

Good Morning Mr Grundler,
The results of the testing done at WVU using on the road testing have been very interesting.
With the extra emissions posing real heath concerns, have you folks considered finding a way to reduce these emissions?
The "Real World Impact" is indeed an issue which needs addressed.
Would you be interested in helping to provide an answer to decrease the emissions which are being released?
Now that WVU has shown the World that Volkswagen is responsible for emitting 10 - 40 times the stated emissions for their vehicles, how great would it be for the EPA to reveal a method to help reduce the deadly emissions?
The EPA is well posed to make a great "Real World Impact" if they could show test results which reduce the emissions without a loss in performance or MPG.
We have been in touch with the EPA a few times in the past, but it seemed the timing was not right.
It would appear the timing is very right at this moment and we would like to work with you folks to provide a method to help reduce the emissions.
We have the technology now and we have proven that it works using outside testing.
Would you be interested in proceeding with an on road test to help reduce these emissions?

Thank you,
Ex. 6

Hi all,

Are you available if we move the briefing start time to 3:15 ET?

I may need to meet you up there as I have a meeting at DOJ with Cynthia. It is the Ford office building, right at Federal Center metro-though I think the front entrance (across from metro is closed), so have to walk around back, we can meet inside at security. I will add address to invite as soon as I get it.

OCT - 1 2015

Volkswagen Group of America, Inc.
2200 Ferdinand Porsche Drive
Herndon, VA 20171

ATTN: Customs Compliance

Dear Sir or Madam:

This letter is to advise you that Volkswagen AG, Audi, AG, and Volkswagen Group of America, Inc. (collectively, VW) are under investigation for possible violations of 19 U.S.C. §§ 1592, 1595a, and other provisions of law. Specifically, on September 18, 2015, Customs and Border Protection (CBP) discovered that VW may have imported light duty diesel engine vehicles into the U.S. from various countries which did not comply with Environmental Protection Agency (EPA)-enforced laws, regulations, and import requirements. These cars are classified in Chapter 87 of the Harmonized Tariff Schedule of the United States and were imported, entered, or introduced at various ports nationwide between 2008 and 2015.

CBP requests that VW conduct a thorough review of *all* entries filed between 2008 and 2015 and identify instances in which vehicles were entered or introduced by means of a false statement(s) or omission(s) in violation of 19 U.S.C. § 1592 and imported contrary to law (EPA statutes) in violation of 19 U.S.C. 1595a. A response to this letter is requested prior to close of business November 16, 2015. Any requests for additional time should be accompanied by an executed statute of limitations waiver and a corporate resolution. Suggested language is attached for your convenience. If you have any questions, please contact Thomas Kendrick, Acting Director, Commercial Fraud Division, at 202-863-6057 or via email at thomas.kendrick@dhs.gov.

Subject: RE: EPA Air Enforcement Division - POC

Meetu,

Greetings. I believe you've had some conversations with two of my colleagues, Jerry Malmo and TJ Kendrick. They asked me to help coordinate a conference call we'd like to have with EPA this week regarding Volkswagen (Our Partner Government Agency (PGA) Branch is within my Division). Tomorrow, Tuesday, between 1:00 to 4:00 or Thursday before 11:00 AM or the afternoon would be preferred (although we'll still have to heard some cats). My PGA program manager for EPA is Kellee Gross, and she is cc'd for further coordination.

In addition to the information discussed below (we're currently clearing the request to share with EPA through our Chief Counsel), we'd like to share the following:

On October 1, 2015, U.S. Customs and Border Protection (CBP) sent the attached letter to Volkswagen Group of America.

Ex. 7 **Ex. 7**

I left you a voicemail but can you can call me directly if you'd like to coordinate further in arranging the conference call. There are many offices on my side who have some involvement.

Thank you.

Ms. Kaul,

I called you earlier today and left you a voice message.

I see you were listed as the POC in the Notice of Violation Letter issued to Volkswagen on the defeat devices installed in their 2009 through 2015 diesel light duty vehicles.

Have you had any conversations with CBP regarding this issue? I know you must be very busy, but if you have a few minutes, I would like to talk to you about this.

Best Regards – Jerry

Subject: Press tour at NVFEL Showcase - David H to give?

Hi Chris,

I'm working with Laura A et al. on the press aspects of the showcase.

I was going to recommend that David H. give the press tour of the lab like last year. He did a fantastic job and we can prep him as necessary for any VW related q's.

Does this make sense to you? I know you will be doing the VIP tour at the same time .

Thanks,

Erin

Hi,

I see. Thank you for the clarification. The testing that you speak of appears to be the testing under the aftermarket retrofit device evaluation program. My colleague Jim Snyder is now responsible for that program. I have copied him on this email so that you can follow up with him about your interest in doing testing with us.

Good Morning Mr Yang,

You and I have spoken a few years ago regarding our device which reduces emissions.

I did try to visit you once at your office, but could not get past security.

With the extra emissions which are being released by the Volkswagen diesels I wanted to reach out to the EPA and see if they would test our device which will reduce the emissions without loss of power or MPG.

A correction seems to be needed now.

It has been calculated that about 35 people may die this year because of the extra emissions of 10 to 40% coming from the 2 liter VW diesels.

In the past, the EPA has proven very difficult for us to work with regarding this device.

Right now today, we can reduce the emissions by at least 10%, and that is better than not doing anything.

All of us need to work towards something to help now and the EPA has a lot of power to make things happen.

Can you help me please?

Thank you,

Ex. 6

Good Morning **Ex. 6**

I apologize that I do not fully understand what you are asking. Your final question was whether we're interested in an on-road test to help reduce emissions. I am not involved in doing vehicle tests in my position, but I use to be involved with the Aftermarket Retrofit Device Evaluation program. Are you asking in regards to this program, or if you have a question specifically related to our test procedures in light of the recent issues we've had with Volkswagen, I can direct you to the proper person who could answer your questions.

Thank you and have a nice day, Ching-shih Yang

Subject: "Real World Impact"

Good Morning Mr Yang,

The results of the testing done at WVU using on the road testing have been very interesting.

With the extra emissions posing real heath concerns, have you folks considered finding a way to reduce these emissions?

The "Real World Impact" is indeed an issue which needs addressed.

Would you be interested in helping to provide an answer to decrease the emissions which are being released?

Now that WVU has shown the World that Volkswagen is responsible for emitting 10 - 40 times the stated emissions for their vehicles, how great would it be for EPA to reveal a method to help reduce the deadly emissions?

The EPA is well posed to make a great "Real World Impact" if they could show test results which reduce the emissions without a loss in performance or MPG.

We have been in touch with the EPA a few times in the past, but it seemed the timing was not right.

It would appear the timing is very right at this moment and we would like to work with you folks to provide a method to help reduce the emissions.

We have the technology now and we have proven that it works using outside testing.

Would you be interested in proceeding with an on road test to help reduce these emissions?

Thank you,

There's an interesting diesel trains wrinkle in the 'defeat device' issue

In short, some of the conditions that seem to pushed Volkswagen to 'defeat' emissions tests are at play with trains

And it would be helpful to have an informal chat with someone there about train emissions and compliance to see if there might be something here

The emissions rules just got though for trains

NOx emissions must come down by 75 pct; hydrocarbon levels by 80 percent

That's a huge jump and train manufacturers are struggling to match that

Caterpillar – one of the two leading locomotive manufactures – could not meet those standards

They've been pushed out of the diesel locomotive sector and left the field to General Electric

Caterpillar now says they can have a 'conforming' engine on the market next year – a move that's surprised some in the industry

Judging by this org chat, I can imagine a few people here at Transportation and Air Quality might be able to help

But if you could help me with that informal chat, grateful

Washington post

The EPA closed the lab that might have caught VW years ago

By Peter Whoriskey October 5 at 10:48 AM

More than 20 years ago, an engineer at the Environmental Protection Agency invented a device that allows technicians to measure the emissions of a car as it is out driving in the real world.

Had the device, then known as ROVER, been used by the EPA to screen cars, it would have detected Volkswagen's cheating long ago, former engineers for the EPA said.

But the Alexandria, Va. lab where the testing device was developed was closed by the EPA about 2001, and the contractors who worked there laid off. The pilot program that used the new devices to test cars from emissions compliance on the road did not continue, officials said.

"When this all came out in the news about VW, my first thought was, 'Wow, we could have been all over this,'" said John Lux, testing manager at the lab.

"It's a coulda, shoulda, woulda situation," said another engineer from the lab who requested anonymity because he still contracts with the government. The testing in Virginia "would have detected the Volkswagen issue immediately."

The news that Volkswagen cheated on car emissions tests for eight years has led to criticism that the pollution checks by the EPA have been too passive.

Agency officials have defended their efforts, and said that they will step up the scrutiny. They said the Virginia lab was closed because it was "outdated" and that its resources were better used at its larger testing facility in Ann Arbor.

But the closure of the Virginia Testing Laboratory suggests that they had the opportunity years ago to make emissions tests more comprehensive.

For years, the EPA has checked car emissions by running tests in a laboratory: the cars spinning their wheels on rollers, while scientists sample and analyze the exhaust.

But as Volkswagen engineers have illustrated, such tests can be cheated. In the Volkswagen case, the cars could detect when they were undergoing a lab test, and when they did, they reduced their emissions. Then, once out on the roads, those cars emitted as much as ten times the legal limts of the pollutants known as nitrogen oxides.

It wasn't until an outside group, the International Council on Clean Transportation, decided to test the cars out on the roads, that the Volkswagen deception was uncovered.

Now many environmental groups and others, are pushing for broad use of those road emissions tests invented in early 1995. The advocates of more road testing note that the Volkswagen deception has been underway since 2008 and was detected almost accidentally — and not by the EPA.

Moreover, they argue, emissions violations are not new — Volkswagen is not alone. Other vehicle and engine makers have been caught in similar violations, though their transgressions involved far fewer cars. Volkwagen's involved about 11 million world-wide.

Among those pushing the government to conduct more of the road test emissions is the environmental group Center for Biological Diversity, which filed a legal petition last week, demanding that the EPA conduct real world testing of all diesel cars going back to model year 2009.

"There's no good reason for EPA not to employ every method possible to detect fraud and protect public health and our climate," said Kristen Monsell, an attorney for the group. "The Volkswagen debacle ought to be a wake-up call for the agency to make that happen."

Current EPA officials disputed the idea that the real world emissions tests, known as ROVER, would have detected the Volkswagen emissions trouble.

"The problem with such hypotheticals is that no one can know what would have happened in those cases," the EPA said in a statement.

For example, EPA officials said, the same Volkswagen engine software that defeated the lab tests might have been configured to defeat the road tests, too.

But experts said that would be unlikely because a road test is unlikely to follow an easily detectable pattern. And without one, it may be close to impossible for a car to know it is being tested.

Indeed, several emissions experts, as well as the former chief of the EPA's emissions office, have said that the ROVER device would have detected the Volkswagen deception.

The idea for real-world testing arose out of an insight by Leo Breton, an engineer at the EPA during the '90s.

Breton's job was to oversee the lab testing of auto emissions carried out by a contractor at the Virginia Testing Laboratory. In the lab tests, cars are put on rollers, and test drivers accelerate and decelerate according to a set pattern, while the output is measured and analyzed.

"I kept wondering whether the emissions numbers being calculated during the lab tests had anything to do with reality," he said.

One of the reasons Breton was skeptical of the lab tests' accuracy is that he saw the test drivers become expert on the test course. That expertise meant that they would step on the accelerator less often than drivers in the real world, and that, in turn, meant that the test cars would show lower emissions.

The test driver also "doesn't have to worry about traffic, or weather, or potholes," Breton said,

and so drive very efficiently. “In the real world, a driver has to step on the gas a lot more.”

The practical challenge he faced was this: How to measure emissions while a car is out on the road? Breton rigged a test apparatus, using a borrowed gas analyzer, to record emissions in the real world. It was improvised because he had no budget. During tests, they stashed the equipment in the backseat, connected a hose to the tailpipe, and set out to measure the pollutants.

It turned out that his suspicions were well founded. What the real world tests showed is that there is a gap between lab tests and real world tests of about 10 to 20 percent, generally.

Gaps of that magnitude were deemed normal. But the equipment also turned up cases where the gaps were much, much larger, and in some of those cases, the road tests were used to show that manufacturers were failing emissions standards.

The first time his device was put to official work, the EPA determined that Cadillacs were emitting three times the permitted amount of carbon monoxide whenever the car’s air-conditioner was in use.

In 1997, it turned up problems with Ford Econoline vans and in 1998, similar problems turned up at seven manufacturers of heavy-duty engines.

The engineers then started a pilot program to test more cars with ROVER, but about 2001, EPA officials closed the Virginia Testing Laboratory.

Chris Grundler, the head of the emissions office at EPA, said the road tests were not regularly used to check diesel car compliance because, compared to trucks, they emit only a small fraction of the pollution.

That car testing “didn’t continue because it didn’t rise to the top of our priority scheme,” he said

Grundler said that he supports checking car emissions using both kinds of tests: those run in the lab , which are more accurate and predictable, as well as those done on the road, which offer the

advantage of testing in real world conditions.

"We're getting calls that the dynamometers [the lab tests] are obsolete — but that's just wrong," Grundler said. "The point is to do this work, you have to do both."

He noted that for years the EPA has been using the road tests to measure the emissions of heavy-duty engines.

Michael P. Walsh, former EPA official overseeing car pollution efforts during the '70s, and winner of MacArthur Foundation "genius" grant in 2005, said he supports efforts to broaden the use of road tests to detect emissions discrepancies.

"We know we've been burned before, and there may have been other cases that we missed," Walsh said. "The way I would look at it is that the first priority is to check the largest sources of pollution – that would be trucks. But you would also do random testing of other engines just so that the industry knows that EPA is looking."

Staff researcher Alice Crites contributed to this report.

COLUMN-Which court will hear Volkswagen class actions?: Frankel

(The opinions expressed here are those of Alison Frankel, a columnist for Reuters.)

By Alison Frankel

(Reuters) - Here's how fast class actions against Volkswagen are proliferating.

Last Tuesday, when the California firm Morris Polich & Purdy filed the initial motion to consolidate litigation by VW owners who claim they were tricked by the automaker's "clean diesel" claims, its brief cited "at least 20 actions" in seven jurisdictions. A week later, according to a brief by Lieff Cabraser Heimann & Bernstein and Seeger Weiss, the number was up to 175 suits.

As of Wednesday, VW and Audi owners whose vehicles have been tainted by the emissions scandal have filed class actions in at least 40 federal jurisdictions in 30 different states.

Obviously, those cases will be consolidated by the Judicial Panel on Multidistrict Litigation, which is scheduled to hear about the VW class actions at its Dec. 3 meeting in New Orleans. But where the consolidated litigation should take place is already being hotly debated by plaintiffs' firms.

Six jurisdictions have been floated so far by different lawyers for car owners. (VW has not yet signaled whether it agrees the cases should be consolidated and, if so, where.)

Three of the six suggestions have to be considered far-fetched. Birmingham, Alabama's best claim on the litigation, for instance, is its proximity to VW facilities in Georgia and Tennessee, according to a brief from Heninger Garrison Davis.

Cleveland, Ohio? The judges there are very good at handling MDLs but don't have very many of

them, says Spangenberg Shibley & Liber, which happens to be based in Cleveland.

According to Robert Hilliard of Hilliard Munoz & Gonzales - one of the plaintiffs' lawyers leading the litigation over GM's faulty ignition switch - the VW cases should go to Corpus Christi, Texas because - well, because Hilliard thinks very highly of the trial judges in his home court.

The more compelling candidates for the VW MDL are Los Angeles; Newark, New Jersey; and Alexandria, Virginia, all of which have also been proposed in filings with the MDL panel.

New Jersey, which is backed by Lieff Cabraser and Seeger Weiss, is Volkswagen's state of incorporation in the U.S. and is the home of the company's U.S. engineering and environmental office as well as other VW corporate operations.

New Jersey is also easily accessible to air travelers from Germany, where Lieff and Seeger Weiss assert the supposed emissions-evading scheme was devised and executed.

The "rocket docket" of Eastern Virginia was proposed by Burns Charest, which can't be accused of hometown chauvinism because it is based in Dallas.

Virginia is the headquarters for the U.S. operations of Volkswagen and Audi, making it "their nerve center and the center of their decision-making process," the Burns firm said. (Clearly, the plaintiffs will have to do some digging to figure out which continent was actually the site of VW's fateful emissions-rigging decisions.)

Burns Charest also points out that Alexandria is a mere 200 miles from Morgantown, West Virginia, where researchers from University of West Virginia first exposed VW's manipulation of the cars' emissions. (For however much that is worth.)

VW sold more "clean diesel" cars in California than any other U.S. state, and more class actions

by car owners have been filed there than anywhere else, according to a brief filed Wednesday at the JPML by Bernstein Litowitz Berger & Grossmann.

Federal judges in Los Angeles, in particular, have already handled sprawling products liability litigation against Kia and Hyundai, which were accused of misrepresenting their fuel efficiency, and against Toyota in the sudden acceleration litigation.

Moreover, according to Bernstein Litowitz and Morris Polich, which is also pushing for consolidation in Los Angeles, the California Air Resources Board helped expose the VW scandal. Its investigative records and important witnesses are already in the state, as is the largest VW testing and product development center outside of Germany.

The plaintiffs' firm Cotchett Pitre & McCarthy makes some of the same California-centric arguments in its brand new brief but argues for consolidation in federal court in San Francisco rather than Los Angeles.

Lawyers in the VW case have until Oct. 20 to file briefs backing one of these courts or proposing a different jurisdiction to oversee the litigation. VW's brief will be especially interesting.

This has the makings of a gigantic case.

Some of the consolidation motions assert that clean diesel cars are worthless because they can't pass some state emissions tests and dealers won't take them back. We are probably years from any judicial decision on that allegation - but VW had better be thinking now about which judge it wants to make that determination.

VW and Audi give back Green Car of the Year awards Audi A3 TDI diesel

By CHARLES FLEMING

For the environmental black marks they've received, Volkswagen and Audi have been asked to give up the green.

The two car companies, embroiled in a widening scandal for their part in cheating on auto diesel emissions tests, have lost the prestigious Green Car of the Year Awards they won for their 2009 Jetta TDI and 2010 Audi A3 TDI.

The two "clean" diesel vehicles are included in a batch of 11 million cars worldwide that VW has admitted are fitted with a "defeat device" designed to trick emissions testing. Both vehicles are on the list of cars the Environmental Protection Agency has charged with emitting as much as 40 times the permitted levels of dangerous pollutants.

That batch of cars includes diesels fitted with 4-cylinder engines built by VW, among them 2009 to 2015 VW Jetta, Golf, Passat and Beetle cars, plus the Audi A3.

The awards were taken away by Green Car Journal, whose editor and publisher announced his decision Tuesday night.

“Rescinding the Green Car of the Year awards for the VW Jetta TDI and Audi A3 TDI is unfortunate but appropriate,” said Ron Cogan.

Attempting to make a virtue of a necessity, Audi of America President Scott Keogh said in a statement, "Audi has won hundreds of races and thousands of awards throughout its history. But we only want to win fair and square. Therefore, in light of recent developments, we believe the only right thing to do is to return this important recognition of environmental stewardship."

Volkswagen of America has also agreed to return its award.

The annual Green Car of the Year award is meant to encourage automakers to continue building vehicles that combine performance, efficiency and low emissions.

Winners for the last several years have been the 2015 BMW i3, 2014 Honda Accord and 2013 Ford Fusion -- the latter two for their entire family of gas, hybrid, and plug-in hybrid models.

VW readies external inquiry into emissions scandal - source

BERLIN | BY ANDREAS CREMER

Senior Volkswagen officials will examine on Wednesday findings from an internal investigation into its rigging of vehicle emission tests and prepare for an external inquiry, a source familiar with the matter told Reuters.

The executive committee of the German carmaker's supervisory board will gather on Wednesday

evening at its Wolfsburg headquarters to assess the initial results of the internal inquiry into the biggest business-related scandal of its 78-year history, said the source, speaking on condition of anonymity.

A representative of U.S. law firm Jones Day, which has been appointed to lead the external investigation, will attend part of Wednesday's meeting, the source added.

Europe's largest carmaker has admitted cheating in diesel emissions tests in the United States. Germany's transport minister says it also manipulated tests in Europe, where Volkswagen sells about 40 percent of its vehicles.

It is under huge pressure to get to grips with a crisis that has wiped more than a third off its market value, sent shock waves through the global auto industry and could damage Germany's economy.

New Chief Executive Matthias Mueller, who took over from Martin Winterkorn last Friday, has promised to find those responsible and to create a new business culture.

"Those people who allowed this to happen, or who made the decision to install this software -- they acted criminally. They must take personal responsibility," supervisory board member Olaf Lies told the BBC.

Winterkorn, CEO for almost nine years, is being investigated by German prosecutors over allegations of fraud. The company suspended three top engineers on Monday and two sources familiar with the matter said on Wednesday that communications chief Stephan Gruehsem was expected to step down.

Investors view an external investigation as particularly important, given the close links of Mueller and chairman-designate Hans Dieter Poetsch to the Piech-Porsche clan that controls Volkswagen.

Shareholder advisory firm Hermes EOS said on Monday it had "real doubts" about Volkswagen's decision to appoint company insiders to top jobs to tackle the crisis.

MANAGEMENT FOCUS

Volkswagen said on Tuesday it would refit up to 11 million vehicles installed with the "cheat" software in one of the biggest such recalls by a single automaker. It has promised to submit details to regulators next month.

Johannes Kleis, communications chief for the European Consumer Organisation, told Reuters it was pressing Volkswagen to give customers information as quickly as possible about any implications for fuel consumption and emissions.

"Time is of the essence," he said.

But analysts say the refit may not be straightforward, and Volkswagen's Czech division Skoda has informed the government in Prague that it will need until the end of October to find a technical solution.

Around 1.2 million Skoda vehicles are affected.

Manipulating emissions results allowed Volkswagen to keep down engine costs in a "clean diesel" strategy that was popular in Europe and at the heart of a drive to improve U.S. results.

The source familiar with the matter told Reuters an engineer questioned in the company's internal probe had warned of illegal practices in emissions measurement as far back as 2011, but that no action was taken.

On top of its own inquiries, Volkswagen faces investigations by regulators and prosecutors across the world, plus potential lawsuits from customers, investors and environmentalists.

Some analysts are concerned management will be so preoccupied with the crisis that they will not have enough time to focus on rebuilding the brand and tackling long-standing areas of underperformance, such as the mass-market VW division, flagging sales in China and a struggling U.S. business.

In a sign of the potential impact of the scandal, a car valuation tracking guide on Wednesday said the value of used Volkswagen diesel cars sold in Britain trailed the wider market in September.

Industry publication Green Car Journal also said on Tuesday it was rescinding "Green Car of the Year" awards given to Volkswagen's 2009 VW Jetta TDI and 2010 Audi A3 TDI models.

However, Skoda said it had not seen any impact on sales or orders since the crisis erupted, and analysts said a halving in sales tax on small cars in China could provide a boost to Volkswagen.

At 1220 GMT, Volkswagen shares were up 1.9 percent at 96.95 euros. The stock has seen about 28 billion euros (£20 billion) wiped off its market value since the crisis began.

Volkswagen's troubles have been an embarrassment for Germany, which has for years held it up as a model of its engineering prowess and has lobbied against some tighter regulations on automakers. The German car industry employs more than 750,000 people and is a major source of export income.

German Finance Minister Wolfgang Schaeuble said on Wednesday the crisis did not pose a danger to the country's economy, Europe's largest, but added: "In the end, VW will not be the same company it once was. A lot will change from a structural perspective."

Car manufacturers fear the crisis could lead to more costly regulations and hit sales of diesel cars.

RPT-Illegal VW diesel emission systems may require two solutions

By Paul Lienert and Joseph White

(Reuters) - Volkswagen AG 's promise to fix pollution control systems on about 11 million diesel vehicles will involve changes to software, and possibly hardware, that could leave owners with cars that deliver diminished fuel economy and performance or require more maintenance, experts said Tuesday.

The German automaker's new chief executive, Matthias Mueller, said Tuesday VW customers would need to have those diesel cars "refitted." The company did not specify what the refitting might entail. Some analysts have said the job could cost more than $6.5 billion.

A former executive of Volkswagen's U.S. operation said Tuesday the company may be required to change only software, and not hardware, to bring older diesel models now deemed illegal into compliance with U.S. emissions standards.

Other experts and U.S. regulators said the German automaker likely will have to come up with two sets of solutions for two different emission-control systems installed on 482,000 U.S. diesel cars from model years 2009-2015.

VW has admitted using software that circumvented U.S. and California pollution rules by fully

activating the exhaust scrubbing systems only when the car was being put through precisely prescribed government emissions tests.

VW hasn't said why it used the illegal "defeat device" to deceive regulators. But the results, at least in the short term, were beneficial: VW was able to pass laboratory tests that showed its U.S. diesel cars met the relevant regulations, but then switched off the emission control devices while driving.

The benefits of switching the pollution control systems off were different depending on which system the vehicles used, experts said.

VW initially installed the illegal software, beginning in late 2008, on 2.0-liter four-cylinder turbo-diesel engines fitted with devices known as "lean NOx traps," designed to reduce nitrogen oxides in engine exhaust. Nitrogen oxide emissions have been linked to smog, acid rain and lung cancer.

EPA on September 25 said it would take longer to fix older VW diesels from model years 2009-2014 that used the lean NOx traps.

Any device used to control nitrogen oxide emissions typically "diminishes the performance and fuel economy" of diesel engines, according to automotive consultant Sandy Munro.

Older VW diesels could be made to function properly with a software fix, said Marc Trahan, who retired in late 2014 as executive vice president of group quality after a 35-year career with VW and its Audi subsidiary. They should not need to have newer hardware installed, which would take much longer, require extensive "re-engineering" and be cost-prohibitive, he said.

Beginning in 2012, Volkswagen offered the same 2.0 TDI engines with a more sophisticated and expensive emissions control system called Selective Catalytic Reduction. These systems, which debuted on VW's largest car, the Passat, injected a liquid urea solution into the exhaust to break down the nitrogen oxides.

These systems also had software that turned them off during normal driving, the company has admitted. The consequences of running the systems all the time will be different for consumers than the older, NOx traps.

Ideally, the urea solution used to control smog-forming gases is supposed to be replaced every 10,000 miles, typically by a dealer, but VW encountered potential problems.

On newer models with the SCR system, Trahan said there were concerns within the company about the urea consumption being so great that it would require separate "fill-ups" every 5,000 miles, rather than the desired 10,000-mile intervals that are typical between engine oil changes.

A software update on the newer diesel models equipped with SCR devices could lead to "reduced vehicle performance and fuel economy and increased urea use," said analyst Kevin Riddell of LMC Automotive. The new software "also will have an impact on resale value and potential marketability," he said.

Volkswagen, its software and the psychology of cheating

Michael Skapinker

What is startling is that the VW affair does not appear to fit into any category of corporate scandal

Shortly after I joined the Financial Times in 1986, the Guinness affair exploded. The company

had offered financial inducements to associates to support its share price during the takeover of Distillers, another drinks company. The chief executive and two others went to jail.

I have followed many corporate scandals since: banks mis-selling financial products, drug companies hiding adverse research results and bribing doctors, dodgy accounting, Libor manipulation.

Even amid this list of shame, Volkswagen's use of sophisticated software to detect when its diesel cars were being tested, and to spew out illegal levels of nitrogen oxides when they were not, is striking in its apparent villainy.

Most corporate scandals follow one of three patterns. The first is that the law is unclear. Many have been testing its boundaries, and those who are finally blamed, fired or jailed either went too far or were selected by prosecutors or regulators to be made examples of.

The Guinness affair fell into this category. As Richard Lambert, later the FT's editor, wrote then, there were "grey areas between the boundaries of the law and accepted City practice" and the actions of those arrested "were not so different from those which had earned them plaudits and rich rewards in other times".

Some, but not all, accounting scandals fall into this category too. Accounting is not an exact science and clients may be desperate for a slight extension of what the auditor accepted last year. The stretching goes on until the company collapses and the auditors are, humiliatingly, fined.

The second category of scandal is where the miscreant company sells customers something that does not help them, or hurts them. The company doing the selling rationalises that it is really up to the customer to decide whether they want to buy it or not. Some of the financial service mis-selling fell into this category, although some involved outright deception.

The third category of scandal occurs because "everyone is doing it" and your company will suffer if you do not. This covers everything from possibly legal but reputation-damaging manoeuvres such as routing profits through low-tax jurisdictions to crass immorality such as

covering up adverse drugs trials and criminal activities such as Libor-rigging and bribe-paying.

If we do not do it, when everyone else does, the justification goes, we, our employees and our shareholders will all be worse off.

Assigning malpractices to these categories does not excuse or justify them in any way. But it helps to explain how they happen.

There are few outright crooks in business. Most people who end up doing wrong drift into it. They push the limits and then, when that year's sales target is a little out of reach, they push a little more.

Their misbehavior is adjacent to their previously acceptable behaviour and, when the regulator levies a huge fine, or the police arrive at the door, it takes some time, thinking back, to identify the moment when they crossed the line.

What is startling about the Volkswagen affair is that it does not appear to fit into any of these categories. There was no grey area. The law set an emissions limit, and the VW models, when they were on the road, exceeded them. The company covered this up with an algorithm that reduced emissions to legal limits during testing.

VW's behavior also did not fall into the category of letting the customers decide. The customers were as deceived as everyone else.

As to the third category, was everyone doing it? We will have to see what emerges. But while other manufacturers may have been gaming the emissions regime by, for example, recharging batteries before testing, so far no other company has been found to have used VW-type "defeat devices".

Devising a system to detect when a car is being tested surely required planning, expertise and a

specific decision. It must have required forethought. It is not something you can drift into through incrementally deteriorating behavior.

We will find out more about who at VW was responsible and why they behaved as they did through regulatory inquiries, class action suits, and — surely — criminal prosecutions.

All corporate misbehavior is reprehensible. But VW's has taken us into different territory.

AP (via US News):

http://www.usnews.com/news/business/articles/2015/09/29/vw-scandal-18-million-commercial-vehicles-affected

VW Scandal Involves Numerous Brands

Volkswagen emissions scandal involves commercial vehicles, SEAT brand; technical fix due October.

Legal experts say the German automaker is likely to face significant legal problems, including potential criminal charges.

BERLIN (AP) — Volkswagen's commercial vehicles and cars from its Spanish unit SEAT are among the 11 million fitted with a diesel engine that can cheat on emissions tests, the company said Tuesday.

Volkswagen AG has admitted using a piece of engine software to cheat on diesel car emissions tests in the U.S., where authorities say there are 482,000 such cars. The company says that up to 11 million vehicles worldwide were fitted with the engine in question.

The company said it would present authorities with its "technical solutions and measures" to fix the problem in October. Not all of the 11 million vehicles, however, would have had the software activated, according to new CEO Matthias Mueller.

Details have emerged gradually of how many were made by which VW division. Guenther Scherelis, a spokesman for the commercial vehicles unit — which makes vans and pickups — on Tuesday confirmed that 1.8 million of its vehicles were affected. He didn't give further details.

Spanish subsidiary SEAT said it fitted 700,000 vehicles with the EA 189 diesel engines in which Volkswagen has said there are "discrepancies."

SEAT said the cars were sold worldwide and it was seeking to determine how many were sold in each market.

Also fitted with the suspect software were 5 million VW brand cars, 2.1 million Audis and 1.2 million Skodas.

SEAT and Volkswagen-Audi Spain on Tuesday ordered a suspension of sales of all SEAT, Volkswagen, Audi, Skoda and Volkswagen commercial vehicles with the EA 189 diesel engine. It said this decision would affect 3,320 vehicles currently in stock.

In a speech to VW managers Monday evening, newly appointed CEO Mueller said that the offending software was activated only in part of the cars fitted with the engine, so "we expect that the number of vehicles actually affected will be smaller," according to extracts released by the company.

He said customers will be informed in the coming days that their vehicles need work and authorities will be presented with "technical solutions" in October.

Mueller said that, alongside the company's internal probe, Volkswagen's supervisory board has commissioned an external investigation by U.S. law firm Jones Day, and "that will start very quickly."

"A long road and a lot of hard work lie ahead of us," he said.

The German government last week set up a commission of inquiry on the scandal. Transport Ministry spokesman Martin Susteck said that the panel is in contact with the U.S. Environmental Protection Agency.

In Brussels, European Union Industry Commissioner Elzbieta Bienkowska was scheduled to meet Tuesday with Volkswagen brand chief Herbert Diess.

"We expect Volkswagen to explain the situation," said EU spokesman Ricardo Cardoso. "The Commission wants facts and wants to get to the bottom of this.

Despite Volkswagen Scandal, Europe's Diesel Habit Could Be Hard to Kick

By STANLEY REEDSEPT. 29, 2015

LONDON — A loyal Volkswagen owner for years, Jane Kelley was "shocked," she says, by recent revelations that the German company had cheated on emissions tests in the United States.

Snug in Ms. Kelley's garage in North London recently was a white 2013 Passat powered by a 2-liter diesel engine. The company says that as many as 11 million of its cars — Volkswagens, Audis, Skodas and SEATs with diesel engines — were equipped with software designed to fool emissions testers.

But as disturbed as she was to learn that Volkswagen had cheated, Ms. Kelley does not necessarily want anything done about it. "Are they going to take my car away and fiddle with the engine?" she worried, as she served tea in her sunlit dining room.

Like at least some other European diesel drivers, Ms. Kelley is in no hurry to abandon the car just because it may spew more noxious fumes than she originally thought. "I do feel that it is a very safe car," she said. She also admires the acceleration of the turbocharged diesel, which she credits with helping her recently escape a potential hazard. "There was a guy weaving, maybe drunk, so I just shot by,'' she recalled.

Ms. Kelley is one of millions of fans of diesel cars across Europe, where fuel prices and taxes make the cost of filling an automobile's tank much higher than in the United States. Drawn by diesels' superior fuel economy over gasoline engines and the lower price of diesel fuel, European consumers have long leaned toward diesel cars — a collective habit that might be difficult to break, despite the new scrutiny the Volkswagen scandal has given to diesel's dark side.

While diesels have struggled in the United States to overcome a reputation as smoke-belching clunkers — they represent about 3 percent of the American car market — they have rolled to dominance across the Atlantic. Diesels accounted for more than half the new cars sold in Western Europe last year, compared with 14 percent in 1990.

Europeans' embrace of diesels has encouraged manufacturers to improve the engines' performance, and it has motivated governments, especially those of Germany and France, to support their auto industries' diesel efforts. Although environmentalists have been sounding alarms for years, the forces propelling diesel were so strong that it might explain why drivers,

carmakers and regulators have been willing at times to overlook diesels' tendency to be bigger polluters than gasoline cars.

"Ban diesels? You can't be serious," Ségolène Royal, the French environment and energy minister, said recently, responding to a suggestion by a member of the Green party. "We can't treat problems of this gravity with ideological slogans, at the expense of French interests," Ms. Royal said, noting that more than half the cars on French roads were diesels.

In fact, the percentage in France is around 64 percent, even higher than in Germany, with French-made Renault, Peugeot and Citroën diesels among those ranks. There has been no indication that the French automakers cheated on emissions tests.

So far, Volkswagen has not said how it plans to deal with the deceptive software problem, although the German government has set an Oct. 7 deadline for the company to propose a solution. Unlike in the United States, where lawyers are already recruiting car owners in hopes of filing class-action lawsuits, there is no similar tradition in Europe that would encourage consumers to collectively demand financial redress.

Volkswagen said on Tuesday that it would prepare a plan by early October to improve the emissions of affected vehicles. Owners will be notified in the weeks and months after the plan has been approved by authorities, the company said.

"If there is a recall, I would be happy if my car is not included in it," said Tony Novak, a retired editor for the BBC who lives in Reading, England. In Britain, just over half of new cars sold are diesels.

"Diesels used to be terrible — they used to be dirty and slow," he said. "Now they are brilliant." Mr. Novak had owned diesel cars previously, but when he bought his 2014 Volkswagen Golf diesel, "I was really surprised by how good it was — you really notice the difference in acceleration."

That Volkswagen might have achieved that performance by cheating — it is still not clear

whether the company needed the deceptive software to pass Europe's emissions tests, which are much less strict than the United States' — is not what matters most to Mr. Novak. "I worry that if they tweak the computer, the performance will deteriorate," he said.

About five million of the affected cars are Golfs, Passats and other Volkswagen-brand cars. An additional two million are Audi brand cars, and the rest or Skoda and SEAT brand cars, or light commercial vehicles.

Matthias Müller, a company insider who was appointed chief executive of Volkswagen last week, told top managers late Monday that the deceptive software was activated in only a portion of the 11 million vehicles that have the so-called EA 189 diesel motors. But Volkswagen did not specify how many cars were designed to cheat on emissions tests.

Some industry experts say that the Volkswagen scandal could prove a turning point in the diesel love affair, if the new scrutiny of European emissions standards and testing makes it easier for the environmentalists to be heard.

The premise of the "clean diesel" notion that Volkswagen promoted was partly based on the fact that on a per-mile basis, diesel engines emit less carbon dioxide — a big contributor to climate change — than gasoline engines. But diesel exhausts, unless cleaned in ways that Volkswagen's software was designed to sidestep, produce larger quantities of other harmful gases — nitrogen dioxide and nitrogen monoxide — along with fine particles that contribute to stubbornly persistent air quality problems in European cities.

Volkswagen Has Refit Plan For Emissions-Rigged Vehicles, Says CEO

Technical solutions to be submitted to relevant authorities in October

By HENDRIK VARNHOLT

Updated Sept. 29, 2015 1:36 p.m. ET

FRANKFURT— Volkswagen AG has a plan to refit vehicles affected by software that can rig an exhaust-emission test, the company's new chief executive said, outlining what is expected to be a massive recall.

Matthias Müller told managers at Volkswagen headquarters in Wolfsburg that a project team put together "a comprehensive action plan" over the weekend and would inform customers shortly about refitting their vehicles.

On Tuesday, Volkswagen said it would submit its technical solutions to regulators and environmental authorities for approval in October, and set up websites to inform affected customers about their vehicles.

Europe's biggest car maker became engulfed in an emissions scandal after U.S. environment authorities said September 18 that it intentionally installed software in some diesel-powered cars to pass U.S. emissions tests. The company has since faced a management shake-up, a $25 billion drop in its market value and demands for clarification from authorities world-wide.

On Tuesday, the Volkswagen-brand car chief, Herbert Diess, was meeting with EU Industry Commissioner Elzbieta Bienkowska in Brussels to discuss the crisis, the EU Commission said

VW crisis signals shift for diesel-focused Europe oil market

Bill Lehane and Firat Kayakiran, Bloomberg

LONDON _ If European oil-market analysts have a single takeout from Volkswagen's emissions cheating, it's that the scandal is probably long-term bearish for the diesel market.

Europe's refineries have been shifting for decades toward greater output of diesel to mirror alterations to the continent's car fleet. As they have done so, imports have also surged, causing an ever-expanding glut to build up, while the fuel itself is under growing scrutiny for risks it may pose to public health.

"This will only be bearish for diesel prices," said Christopher Haines, a London-based senior oil and gas analyst at BMI Research, which is part of the Fitch Group. "Output levels are good and at the same time stocks are high. If consumption dips, prices will follow."

Europe has record amounts of gasoil -- a near identical fuel to diesel -- held at independent storage tanks in Belgium and the Netherlands, according to PJK International, a Dutch firm that's monitored regional supplies for decades. Debate about the fuel's risk to public health had been growing long before the VW scandal: the World Health Organization said in 2012 that diesel-exhaust emissions cause cancer.

Volkswagen AG's stock will be removed from the Dow Jones Sustainability indexes pending a review of its status after the carmaker's admission it cheated on emissions tests, S&P Dow Jones Indices LLC and RobecoSAM said in a statement Tuesday.

While Europe's oil refineries have been boosting the proportion of diesel they make, a shift back toward higher gasoline consumption could be beneficial to them, according to Petromatrix GmbH, a consultant based in Zug, Switzerland. When the region's plants were built, they were configured to make gasoline.

Europe imports diesel from Russia, the U.S. and also from newly built refineries in India and the

Middle East that more than cover a domestic shortfall in output. Shifting back toward gasoline would help to make European plants more self sufficient, according to Alessandra Agnello, an analyst at Petromatrix.

"In the medium term, this is a negative for diesel and a positive for gasoline," Andrew Echlin, an oil products analyst at consultant Energy Aspects Ltd., said. "It will greatly slow down any impetus towards dieselisation in the U.S., as well as encourage European regulators to take another look at diesel car regulations and testing, which were already planned for 2018."

Diesel cars' market share is already starting to dwindle in some European countries and drivers are becoming increasingly sensitive to pollution issues from the fuel, according to Petromatrix.

"Diesel consumption will fall as a consequence of the falling diesel car sales," said Angello. "The VW scandal will accelerate this trend, but it will take some time to see it."

Independently held supplies of gasoil are close to a record at 3.6 million metric tons in Europe's trading heartlands of Antwerp, Rotterdam and Amsterdam, according to data from PJK. Gasoil, once predominantly for heating, is now an almost identical fuel to diesel because of regulatory changes that lower its sulfur content.

About 41 percent of all European cars ran on diesel last year compared with 27 percent a decade earlier, according to data from the European Environment Agency. The proportion has grown every year for the past decade, a trend with which the region's refiners have been doing their best to keep pace.

About 40 percent of the region's refineries' output is now diesel compared with 36 percent a decade ago, according to industry data compiled by Energy Aspects. Gasoline output has dropped to about 20 percent from 23 percent over the same timespan, Energy Aspects estimates.

"The scandal over manipulated data in VW diesel vehicles will cast a long shadow over the diesel market," Commerzbank analysts including Eugen Weinberg said in a Sept. 24 note. "It could put the brakes on diesel cars and thus reduce consumption of diesel."

The Washington Post:

http://www.washingtonpost.com/cars/breaking-volkswagen-will-recall-all-11-million-diesel-cars-with-emissions-cheating-software/2015/09/29/a732419a-66ca-11e5-bdb6-6861f4521205_story.html

BREAKING: Volkswagen Will Recall All 11 Million Diesel Cars With Emissions-Cheating Software

By Richard Read

This morning, Reuters reports that Volkswagen plans to issue a worldwide recall for all 11 million diesel vehicles equipped with software designed to cheat on emissions tests.

That in itself isn't too surprising. For a problem this big, a deception this egregious, VW would be expected to repair the affected vehicles.

No, what's surprising is that VW plans to begin the recall process "in the next few days".

THE BEGINNING OF THE END?

The announcement was made by Volkswagen's brand-new CEO, Matthias Muller, who took the

corner office last Friday after longtime occupant Martin Winterkorn, was forced out. Clearly, Muller is trying to fast-track VW's rebound from international laughingstock to "world's biggest automaker".

Unfortunately, the road to recovery is likely to be very, very bumpy.

For starters, there will be many, many investigations. Volkswagen installed its deceptive software on vehicles sold in the U.S., Germany, Australia, Sweden, and other countries, which translates into multiple probes, multiple testimonies, multiple legal fees, and in all likelihood, multiple fines.

In the process, the scope of the scandal may broaden. We've already learned that 2.1 million Audi vehicles are equipped with the emissions-test-cheating software, as are 1.2 million made by Skoda. What other revelations will there be -- especially in the wake of increased scrutiny from regulators around the globe?

And last but certainly not least, there's the problem of the repair itself, which could spawn an entirely new wave of headaches for VW.

As we discussed yesterday, there's no easy fix for the diesel emissions issue. Yes, VW and Audi can upgrade the software on their vehicles -- and that seems like what they're planning.

In doing so, however, the new software will likely engage all the vehicles' emissions controls, which will bring the cars in line with federal regulations, but also diminish fuel economy. And that presents a whole new set of problems in the form of class-action lawsuits from customers mad about their missing MPGs -- not to mention diminished resale value of their vehicles.

Volkswagen has set aside a massive chunk of change to resolve the "Dieselgate" issue -- somewhere between $6 billion and $7.5 billion. By the time that the company slogs through all these probes, fixes, fines, and lawsuits, though, we're not sure that'll be enough.

VW chief Matthias Müller pledges fix for emissions faults

Chris Bryant in Frankfurt

September 29, 2015 12:23 pm

The new Chief Executive of Volkswagen said on Friday his priority is to win back trust that has been lost in the company after a scandal over its rigging of diesel emissions tests. The former head of Volkswagen's Porsche sports-car division, succeeds former CEO Martin Winterkorn, who resigned on Wednesday.

Matthias Müller, the new chief executive of Volkswagen, has promised to present regulators by October with a technical fix to remove software in diesel vehicles that is at the heart the global emissions scandal.

Addressing top managers at VW's headquarters in Wolfsburg, he said on Monday evening the group faced the "biggest test in our history".

"Together I want to prove to the world that Volkswagen deserves the public's trust," said Mr Müller, who last Friday replaced Martin Winterkorn as chief executive of Europe's largest carmaker by sales.

On Tuesday, VW's shares were down 0.3 per cent at €98.97. The stock has fallen almost 40 per cent since September 18, when a US regulator revealed the German carmaker had installed software in diesel vehicles that served to understate emissions of harmful nitrogen oxides in emissions tests.

VW said last week that up to 11m vehicles contained software-based defeat devices that facilitated the cheating during laboratory tests. On Tuesday, the group's commercial vehicles division said 1.8m of its vehicles were among those affected.

VW owners will be told in the coming days if their vehicles require a refit. Once regulators approve the technical fix, customers will be invited to make an appointment with a mechanic.

Mr. Müller reiterated the software is only activated in a "portion" of the 11m vehicles. This might mean the fix is relatively straightforward for some cars.

VW is putting together an action plan to deal with the crisis, and has appointed Jones Day, a US law firm, to carry out an investigation into how the emissions cheating occurred.

"It's about winning back lost trust," said Mr Müller. "For that we need an unsparing and systematic enquiry ... We will learn from our mistakes."

In depth

Herbert Diess, head of the core VW brand, is expected to meet with Elzbieta Bienkowska, EU commissioner for industry and the internal market, on Tuesday to discuss the scandal.

Investors are concerned that VW faces billions of euros in fines, recall costs and lawsuits in the wake of the affair, as well as damage to its brand that could undermine demand for its vehicles.

The Dow Jones Sustainability Indices said it planned to remove VW from benchmark lists due to the emission tests manipulation.

German prosecutors have launched a preliminary investigation into whether Mr Winterkorn defrauded customers in relation to the scandal. Mr Winterkorn, who resigned last Wednesday, has denied prior knowledge of the cheating.

VW: 1.8M COMMERCIAL VEHICLES, 700,000 SEAT CARS AFFECTED

BERLIN (AP) -- Volkswagen said Tuesday that 1.8 million commercial vehicles are among those affected by the emissions-rigging scandal, while Spanish unit SEAT said 700,000 of its cars were fitted with the diesel engine in question.

Volkswagen AG has admitted using a piece of engine software to cheat on diesel car emissions tests in the U.S. It said last week the engines concerned are in some 11 million vehicles worldwide, far more than the 482,000 originally identified by U.S. authorities.

Details have emerged gradually of how many were made by which VW division. Guenther Scherelis, a spokesman for the commercial vehicles unit - which makes vans and pickups - on Tuesday confirmed a report in the daily Hannoversche Allgemeine Zeitung that 1.8 million of its vehicles were affected. He didn't give further details.

Spanish subsidiary SEAT said it fitted 700,000 vehicles with the EA 189 diesel engines in which Volkswagen has said there are "discrepancies."

SEAT said the cars were sold worldwide and it was seeking to determine how many were sold in each market.

Also fitted with the suspect software were 5 million VW brand cars, 2.1 million Audis and 1.2 million Skodas.

SEAT and Volkswagen-Audi Spain on Tuesday ordered a suspension of sales of all SEAT, Volkswagen, Audi, Skoda and Volkswagen commercial vehicles with the EA 189 diesel engine. It said this decision would affect 3,320 vehicles currently in stock.

In Brussels, European Union Industry Commissioner Elzbieta Bienkowska was scheduled to meet Tuesday with Volkswagen brand chief Herbert Diess.

"We expect Volkswagen to explain the situation," said EU spokesman Ricardo Cardoso. "The Commission wants facts and wants to get to the bottom of this."

The German government last week set up a commission of inquiry on the scandal. Transport Ministry spokesman Martin Susteck said that the panel is in contact with the U.S. Environmental Protection Agency.

UPDATE 1-Volkswagen to refit cars affected by emissions scandal

BERLIN, Sept 29 (Reuters) - Volkswagen signaled on Tuesday it would recall up to 11 million vehicles as it tries to address the scandal over its admission that it cheated U.S. diesel emissions tests.

New Chief Executive Matthias Mueller said the German carmaker had drawn up a "comprehensive" refit plan to be submitted to regulators aimed at ensuring its diesel models complied with emissions standards.

It will ask customers "in the next few days" to have diesel models equipped with manipulated software refitted and brief authorities on technical fixes in October, Matthias Mueller told a closed-door gathering of about 1,000 top managers at Volkswagen's Wolfsburg headquarters late on Monday.

The company is under huge pressure to tackle the biggest business-related crisis in its 78-year history. Germany's KBA regulator had set an Oct. 7 deadline for it to present a plan to bring diesel emissions into line with the law.

Volkswagen has said previously about 11 million vehicles were fitted with software capable of cheating emissions tests, including 5 million at its namesake brand, 2.1 million at luxury brand Audi, 1.2 million at Czech division Skoda and 1.8 million light commercial vehicles.

"We are facing a long trudge and a lot of hard work," Mueller, appointed CEO of Europe's biggest automaker last Friday, said in the speech text seen by Reuters. "We will only be able to make progress in steps and there will be setbacks."

Separately, Mueller said Volkswagen's troubled core VW division, struggling with high fixed costs and low profit margins, would in future be able to act as independently as premium flagship brands Audi and Porsche.

"The new company structure is a first step and the basis for a modernization of VW, for a new and better company," he said. (Reporting by Andreas Cremer; Editing by Ludwig Burger and Mark Potter)

Seat says 700,000 cars have 'cheat' emissions software VW crisis

Seat has said about 700,000 of its cars are fitted with the software that allowed parent company Volkswagen to cheat US emissions tests.

A spokesman said they are currently trying to work out how many were sold in each national market.

In Spain slightly over 3,000 new cars are affected but showrooms have been told to put them aside.

VW has said a total of 11m diesel engines are involved in the emission's scandal.

Broken down brand-by-brand they are:

- VW - 5m
- Audi - 2.1m
- Skoda - 1.2m
- Seat - 700,000
- Vans - 1.8m

Seat said it planned to contact owners so their cars can undergo tests.

It will also set up a search engine on its website to allow customers to find out if their vehicles are affected.

The Spanish carmaker said it had temporarily suspended the sale and delivery of all new vehicles with the EA 189 engines which contain the software.

Volkswagen scandal

11 million

Vehicles affected worldwide

- €6.5bn Set aside by VW
- $18bn Potential fines
- No. 1 Global carmaker in sales

Scandal spilling over

The scandal is continuing to hit VW's share price. On Tuesday it fell another 1.5% during morning trade in Frankfurt. The company has lost 35% of its market value since last Monday.

A survey of 62 institutional investors by the investment banking advisory firm Evercore, showed 66% of them would not invest in VW for 6 months or until it clarified what costs, fines, and legal proceedings it faced.

The effects are also spilling over into the local economy around VW's headquarters in Wolfsburg. The city is expecting a fall in business tax revenue from VW and the mayor has announced a budget freeze and hiring ban on public sector workers.

The scandal was revealed after the US Environmental Protection Agency found that some VW diesel cars were fitted with devices that could detect when the engine was being tested, and could change the car's performance to improve results.

The German company has apologised for breaching consumers' trust, and on Friday announced that Matthias Mueller was replacing Martin Winterkorn as chief executive. Mr Mueller promised a "relentless" investigation to uncover what went wrong.

He said the group was "facing the severest test in its history."

German prosecutors announced on Monday that it was conducting a criminal investigation of Volkswagen's former chief executive.

Volkswagen Close to Diesel Fix as Sales of Rigged Cars Halted

Elisabeth Behrmann

September 29, 2015 — 8:06 AM EDT

A brand new Volkswagen Passat and a Golf 7 car are stored in a tower at the Volkswagen Autostadt complex near the Volkswagen factory in Wolfsburg, Germany.

Sales halted in Spain, Switzerland, Italy and the Netherlands

- Volkswagen to inform customers soon of plans for repairs

Volkswagen AG is close to announcing a fix to emissions systems that cheated on pollution tests, as sales of vehicles with the rigged diesel engines get halted in a growing number of European countries.

Cars with the affected diesel engines are being pulled from markets including Spain, Switzerland, Italy, the Netherlands and Belgium, while prosecutors in Sweden consider opening an investigation on potential corruption. For vehicles already sold, Volkswagen is looking to inform customers soon about the steps it will take to repair the vehicles.

"It's going to depress their market share for a while, maybe even up to one to two years," said Richard Gane, an automotive specialist at supply-chain consultancy Vendigital Ltd. "This is going to run and run."

Almost two weeks after it publicly admitted to cheating on diesel emissions tests in the U.S., Volkswagen has yet to provide a comprehensive breakdown of the car models and markets affected. Information has emerged piecemeal in the scandal over a type of diesel engine installed in as many as 11 million vehicles worldwide. The number includes about 5 million VW brand cars, 2.1 million Audi models, 1.2 million from the Skoda unit and 700,000 from the Spanish Seat nameplate.

German Deadline

To reach out to customers, Volkswagen is looking into setting up websites in various countries so drivers can check on actions locally. The company has already set up a site in the U.S., where the scandal started.

The German government has set an Oct. 7 deadline for Volkswagen to say how it'll bring some 2.8 million diesels in its home market up to standard, threatening to pull the cars off the road if the carmaker fails to do so.

As Volkswagen seeks to recover, the executive committee of its supervisory board, made up of union officials as well as shareholder representatives from the Porsche family and Lower Saxony, is meeting Wednesday to discuss the latest results from the investigation, a person familiar with the situation said.

Volkswagen Chief Executive Officer Matthias Mueller, who was appointed on Friday, said a project team devised a plan over the weekend and the company will start informing customers in the coming days that the emissions of their vehicles will need to be improved. The fix will be presented to regulators for approval in October.

'Long Road'

"We have a long road and a lot of work ahead of us," Mueller said in a speech to Volkswagen's management late Monday, confirming that the company hired law firmJones Day to assist with its internal investigation. "To this end, thoroughness is more important than speed."

Still, pressure is building on the company to come up with a solution. Swedish prosecutors at the National Anti-Corruption Unit are evaluating whether they have jurisdiction to start their own probe, said Alf Johansson, a chief prosecutor at the unit. In the Netherlands, the government is exploring regionwide recall of the vehicles.

"We would like you to consider the possibilities of a European recall," Dutch State Secretary Wilma Mansveld said in a Sept. 25 letter to the European Commission. "This has to ensure that all faulty software is removed from the market and replaced by proper software that allows proper emission reduction."

Bloomberg:

http://www.bloomberg.com/politics/articles/2015-09-29/california-teachers-pension-scolds-volkswagen-on-emissions-dupe

California Teachers' Pension Scolds Volkswagen on Emissions Dupe

Alison Vekshin Margaret CollinsTim Jones

September 29, 2015 — 5:00 AM EDT

California's $184 billion pension fund for school teachers chided Volkswagen AG for rigging some diesel engines to cheat on U.S. emission tests and said it is evaluating its exposure to losses from the scandal.

The California State Teachers' Retirement System, the second biggest U.S public pension, held 37,580 Volkswagen shares valued at $4.85 million as of Sept. 25 and 284,856 of the company's preferred shares worth $34.2 million.

The Wolfsburg, Germany-based company admitted Sept. 18 that it programmed some of its cars' diesel engines to meet emissions standards only when undergoing official tests while letting them exceed legal pollutant limits on the road. Volkswagen's market value has plunged 27 billion euros ($30.3 billion) since the announcement.

"As owners we actively monitor our holdings and expect our portfolio companies to govern themselves responsibly."

- Michael Sicilia, Calstrs spokesman

"Calstrs is clearly disappointed that a company in our portfolio has managed to simultaneously damage both its shareholder value and the environment that we're pledging to protect," said Michael Sicilia, a Calstrs spokesman. "As owners we actively monitor our holdings and expect our portfolio companies to govern themselves responsibly."

About 11 million vehicles around the world were fitted with the defeat devices. The company has set aside 6.5 billion euros to cover damages including fixes, potential regulatory fines and lawsuits.

Not only is California home to the two biggest public pension funds, it has more of the cars on its roads than any other state and has the toughest carbon emission standards in the U.S.

Following the admission that the company cheated in order to try and gain U.S. market share, Chief Executive Officer Martin Winterkorn stepped down and the U.S. Federal Bureau of Investigation has opened a criminal probe. U.S. states also are looking into the company's actions.

Volkswagen is facing more than 80 federal court lawsuits by consumers alleging the company committed fraud by cheating on emissions tests, inducing them to pay more for their vehicles. Those lawsuits were filed as class actions representing all consumers in the U.S. or in individual states who leased or bought the vehicles.

A Michigan pension fund for police and firefighters alleges in a lawsuit that holders of VW's American depositary receipts lost hundreds of millions of dollars.

The $286 billion California Public Employees' Retirement System said it has about $165 million invested in Volkswagen. The fund, the biggest in the U.S., is "examining the situation and

continue to monitor," said spokesman Joe DeAnda.

New York state's pension fund -- which was worth $184.5 billion as of March 31 -- has 22,927 ordinary shares of Volkswagen valued at about $5 million, according to Matt Sweeney, a spokesman for state Comptroller Thomas DiNapoli, the fund's sole trustee. It has another 159,979 shares of Volkswagen's non-voting preferred shares worth $33.3 million, Sweeney said by e-mail.

The $50 billion Alaska Permanent Fund Corporation held 15,009 shares of Volkswagen stock as of June 30, valued at $3.47 million. "It doesn't exactly move the needle, does it?" said Laura Achee, the fund's director of communications.

The Teacher Retirement System of Texas declined to comment on its holdings but said that any investment in Volkswagen would be a drop in the bucket of its $132 billion assets, according to communications director Howard Goldman. At the $26 billion Employees Retirement System of Texas, which provides retirement benefits for state employees, retirees and their dependents, VW holdings are similarly negligible.

"We have some in equities and in fixed income, but very small," said spokeswoman Mary Jane Wardlow in an e-mail.

Volkswagen shares are also held in the pension plans of private companies including General Motors Co. and International Business Machines Corp., according to their latest filings with the Labor Department.

GM doesn't comment on individual holdings in its pension plans, spokesman Pat Morrissey said in an e-mail. The company reported shares in Volkswagen valued at about $1 million in its latest filing with the Labor Department as of Sept. 30, 2014. That's a small portion of the plan's about $80 billion.

CBS News:

http://www.cbsnews.com/news/volkswagen-faces-daunting-challenges-in-fixing-emissions-cheating/

VW faces daunting challenges in fixing emissions cheating

DETROIT - Volkswagen faces daunting challenges in fixing software that enables cheating on diesel engine emissions tests, a task that's becoming more urgent because of growing anger from customers.

The company has set aside $7.3 billion to pay for the scandal. But experts say it's likely to cost much more as VW tries to comply with U.S. clean air regulations while appeasing diesel owners who paid extra for the cars, thinking they could help the environment without sacrificing performance.

"We understand that owners of the cars affected by the emissions compliance issues are upset," VW said on a consumer website launched Sunday. The company asked for patience and said it would address the issue as fast as it can. A spokeswoman wouldn't comment further.

But experts said VW will have to strike a careful balance to appease government regulators, make customers happy and avoid emptying the company cash box. A cheap remedy of software fixes likely would hurt performance and gas mileage, further antagonizing customers. A more expensive fix that adds a treatment system wouldn't hurt performance, but it would cost thousands per car and by one analyst's estimate, could total more than $20 billion including vehicles in the U.S. and Europe.

That's in addition to a potential $18 billion fine in the U.S. and the cost of numerous class-action lawsuits alleging that VW's cheating reduced the value of its customers' cars.

The scandal broke on Sept. 18, when the U.S. Environmental Protection Agency and the California Air Resources Board accused VW of installing secret software on 2-liter four-cylinder diesel engines that turned on pollution controls for lab tests and shut them off during real-world driving. As a result, 482,000 Jettas, Beetles, Golfs and Passats from the 2009 to 2015 model years belched out 10 to 40 times as much ozone-causing nitrogen oxide as U.S. law allows.

A few days later, VW admitted the same "defeat device" that switched the pollution controls on and off was on 11 million cars worldwide. Germany says 2.8 million cars there are affected.

Software in the main engine control computer figured out when the cars were being tested on a treadmill-like device called a dynamometer that the EPA used for verification and turned the controls on.

With the pollution controls on, the cars are less efficient and won't accelerate as fast, the two main reasons why people bought the VW diesels, said Matt DeLorenzo, managing editor and a diesel expert for Kelley Blue Book. VW could change the software and leave the controls on to satisfy the EPA and California regulators. But that would anger customers and likely would force VW to compensate them for the reduced mileage, just as Hyundai did when it got caught with inflated fuel economy estimates, DeLorenzo said.

"If it's really sluggish and doesn't get out of its own way, that's a bigger issue (to customers) than fuel economy," DeLorenzo said. "People notice that big of a change in performance."

The other option is to add a diesel exhaust treatment system that's used by other manufacturers and even by VW on larger diesel engines. The treatment involves adding a tank of a chemical called urea, which enables the cars to separate nitrogen oxide into harmless nitrogen and oxygen. That would cost $2,000 or more per car, DeLorenzo said.

Engineers would have to find room for a tank to store the blue urea fluid, which has to be refilled about every 7,500 miles, DeLorenzo said. And VW probably would have to compensate customers for years of urea cost, which is about $13 for 2.5 gallons.

VW probably tried to avoid urea systems in the beginning because their cost would have driven Jetta and Golf prices above competitors, especially gas-electric hybrids, DeLorenzo said. Now, adding it after the fact will cost even more, he said.

The scandal has forced Volkswagen to tell U.S. dealers not to sell cars with the suspect diesel engines. VW said on Sunday that it's working to get government approval to sell 2016 models with updated engines "which we believe do not have any of the issues the government has identified in other vehicles."

The 2015 and 2016 models have a new version of the 2-liter diesel engine that probably runs cleaner and could need just a software change to comply, DeLorenzo said.

But on older models from 2009 to 2014, the fix may be more difficult. Mike Jackson, CEO of AutoNation, the largest dealership chain in the U.S., said he was told by VW that it will take hardware and software changes to fix the older models. The EPA says it may take VW a year to develop a fix.

Before the 2009 model year, U.S. diesel emissions standards weren't as strict, so those cars likely passed the tests without a defeat device, DeLorenzo said.

Whenever the fix comes, it's possible that owners might not get it done if it hurts their cars' mileage and performance, and the EPA can't force people to take their cars in for repairs. The agency only has authority over automakers, not car owners.

The EPA says some states require proof that emissions recalls have been fixed before license plates are renewed. And the possibility of failing emissions inspections in states that require them apparently won't be an issue because of the cheating software. "The defeat device was

specifically designed to ensure that vehicles would pass inspection," the agency says on its website.

In wake of the scandal, the automaker's stock dropped about 30 percent this past week alone, CBS News correspondent Kris Van Cleave reported.

Volkswagen introduced is new CEO on Friday. Matthias Mueller, the former head of Porsche, will try to restore VW's reputation.

The Guardian:

http://www.theguardian.com/business/2015/sep/26/volkswagen-scandal-emissions-tests-john-german-research

Meet John German: the man who helped expose Volkswagen's emissions scandal

Automative engineer's research connected the dots to how the automaker manipulated diesel emissions tests – but that was never the intention

Rupert Neate in New York

John German has barely had time to catch his breath all week between appearances on TV news channel and radio phone-in shows. He's an unlikely media star, not a pop singer or reality TV contestant, but a grey-haired automotive engineer thrust into the global spotlight after he and his colleagues were credited with helping uncover one of the biggest ever corporate scandals.

"We really didn't expect to find anything," German said of his research that found Volkswagen had installed sophisticated software designed to cheat strict emission tests across the world. His simple test – checking the car's emissions on real roads rather than in lab test conditions – led to the resignation of VW's chief executive after the German company was forced to admit it installed "defeat devices" in 11m cars. The scandal has wiped more than €24bn ($26.8bn) off VW's market value.

Many questions remain but one thing is clear to German: "It was not an accident," he said. "A lot of work has gone into this."

When German finally found a moment of peace this week he called his wife in Ann Arbor, Michigan. "She said: 'You know you've made it now, you can retire and be very happy'," German told the Guardian as he prepared to board a plane back to Michigan after a week in the spotlight in Washington DC. "No, no, no, I can't afford to yet," German told his disappointed wife.

He may have helped uncover one of the world's biggest corporate scandals, but German earns a modest salary as US co-lead of the International Council on Clean Transportation (ICCT) a small nonprofit organisation dedicated to helping to reduce vehicle emissions and has an annual budget of just $12m.

"It has been totally overwhelming," German said of the global interest in his research this week. "I've been doing nothing else [but responding to the media and politicians] for 12 hours a day since Friday," when US regulators announced their findings against VW based on German's research] "We're a small organisation that primarily deals with information on diesel filters, so this is unprecedented and overwhelming.

"As an organisation that is trying to reduce emissions and improve efficiency it is always gratifying to see results from our work, but we never dreamed we would have this kind of impact."

German explained that the idea to carry out the test, which he described as "very ordinary", came from Peter Mock, a colleague in Europe, who noticed discrepancies in the emissions of the diesel VW Passat and VW Jetta. He said they decided to carry out on-the-road tests in the US as the emissions regulations are much stricter than in the EU. They expected the cars to pass and they could use this as proof to show Europeans that it was possible to run diesels with cleaner emissions.

German, who has a degree in physics from the University of Michigan and said he "got over halfway through an MBA before he came to his senses", sought out the assistance of the West Virginia University's Center for Alternative Fuels, Engines and Emissions. The WVU provided a portable emission measurement system that could be put in the car's boot (trunk) with an attached probe placed in the exhaust pipe.

Then German sourced a Passat, Jetta and a BMW X5 (which also showed emissions discrepancies in Europe) and "had a drive around". "The VWs were massively exceeding their official emissions readings in normal driving conditions, which was completely inexplicable and totally surprised us," German said.

Thinking it must be a technical error, the tests were expanded and the cars were driven more than 1,200 miles from San Diego to Seattle – almost the entire length of the west coast of the US.

The VWs nitrogen oxide emissions – which creates smog and has been linked to increased asthma attacks and other respiratory illnesses – still exceeded the US standards by up to 35 times. The BMW X5 was within the regulated range.

Arvind Thiruvengadam, a research assistant professor at WVU, who conducted the tests said: "We were doubting ourselves and our procedures and making sure to double check that we were not doing anything wrong. We did so much testing we couldn't possibly doing the same mistake again and again.

"We were like 'OK, we're going to write a lot of journal papers, and we'll be happy if three people read these journal papers,'" he told National Public Radio last week. "That's our happiness at that point."

German published the research in May 2014 and handed it over to the Environment Protection Agency (EPA). "There was an expectation that they would find out what was causing the higher-than-expected emissions," he said. "We did send a courtesy copy to VW to say 'vehicles B and C are your vehicles and you might like to know', we had no response."

There was no response from the EPA either, but keen-eyed German noticed an EPA press release in which VW agreed to recall almost 500,000 vehicles in December 2014 to reinstall software, which it said would solve the higher-than-expected emissions.

However, a couple of months later the California Air Resources Board (Carb) carried out spot checks and discovered that the "defeat device" software – used to dramatically reduces nitrogen oxide (NOx) emissions only when the cars are undergoing strict emission tests – was still present.

"That is actually the single most inexplicable thing about this whole business," German said. "VW had a chance to fix the problem, and they continued to try and cheat and do what they had done. That's just amazing."

"Only then did VW admit it had designed and installed a defeat device in these vehicles in the form of a sophisticated software algorithm that detected when a vehicle was undergoing emissions testing," the EPA said in a statement last week.

German said it was unclear how the defeat device software worked, but the software could work by detecting periods when the steering column wasn't turning but the wheels were which would indicate the car was on dynamo-meters for testing, or could also test for the precise uniform temperature that the tests are carried out at.

"The kind of software it takes to first detect when you're driving on the official test would be very hard to develop. And then you would need duplicate software to tell the car to have two different emission controls."

UK, France and Germany lobbied for flawed car emissions tests, documents reveal

He said it was impossible to know how far up the food chain at VW the fraudulent activity went, but said: "It would have had to be quite a few people involved. It certainly won't have just been one individual."

German said VW could have continued in the deceit for the foreseeable future if no one had thought to test the cars emissions on real roads. He said there is no way to know if other car companies may also have been using similar methods to trick official emission tests, but welcomed UK, German and US regulators moves to retest cars emissions on real roads.

German, who drives a 1997 Honda Accord station wagon that he says has pretty good emissions for a manual transmission, said he hopes his work will act as a wake-up call and scare the whole industry into making certain that their vehicles comply with all emissions regulations. "Companies should realise they might get away with stuff for a little while, but it will catch up with them."

He refused to enter into discussion about what sort of action should be taken against VW, which is facing a fine of up to $16bn in the US alone and a possible criminal investigation. "That's really up to others, I'm just an engineer from Michigan it's really beyond my field of reach."

Consumerist:

http://consumerist.com/2015/09/28/report-volkswagen-knew-of-defeat-devices-eight-years-before-epa-action/

Report: Volkswagen Knew Of "Defeat Devices" Eight Years Before EPA Action

By Ashlee Kieler September 28, 2015

An internal review spurred by the emissions scandal that has engulfed Volkswagen over the past week found that the carmaker knew that so-called "defeat devices," used to trick emissions tests, were used in more than 11 million VW and 2.1 million Audi diesel vehicles for several years before the Environmental Protection Agency issued a violation notice to the manufacturer ordering it to recall some 500,000 million sedans.

The Associated Press, citing two German publications, reported Monday that VW's internal investigation has so far found at least two incidents in which VW was made aware that the use of

defeat devices were against the law.

The Frankfurter Allgemeine Sonntagszeitung, a German publication, reported on Sunday that VW's internal investigation shows one of the company's own technicians was aware of the software.

Back in 2011, an engineer reportedly expressed concern that using the device was illegal, but was ignored.

The same investigation turned up a letter, dated 2007, from parts supplier Bosch that warned the car company not to use the software during regular operations of vehicles.

According to Bild am Sonntag, sources uncovered the internal communications between Bosch and VW, with the parts supplier insisting that the software was for test purposes and that using it in regular operation would be against the law.

Bosch, one of the largest car parts suppliers in the world, admitted last week that it supplied many of the key components for the defeat devices as a way to evade emissions standards for certain pollutants with a range of serious health effects.

According to the EPA's order [PDF], the "sophisticated software algorithm" in the vehicles is programmed to detect when the car is undergoing official emissions testing, and to only turn on full emissions control systems during that testing.

However, the effectiveness of these vehicles' pollution emissions control devices is greatly reduced during all normal driving situations.

Volkswagen declined to address the new reports, saying it doesn't comment on "rumors and speculation."

"Volkswagen is working with all its strength to conduct a thorough and merciless investigation of this matter," a spokesperson tells the AP.

In addition to new revelations that VW was aware that the defeat devices were illegal, CNBC reports that the company's now former CEO Martin Winterkorn is under criminal investigation by German prosecutors related to fraud.

Winterkorn stepped down last week, noting that he took full responsibility for irregularities in nearly 11 million diesel vehicles found to contain "defeat devices," the former CEO is at the center of the latest investigation into the manufacturer.

Mothers Jones:

http://www.motherjones.com/kevin-drum/2015/09/vw-tries-blame-engine-emissions-fraud-low-level-engineers-and-technicians

VW Tries to Blame Engine Emissions Fraud on Low-Level "Engineers and Technicians"

—By Kevin Drum

I guess it was just a few bad apples. That's a relief:

Volkswagen has blamed its emissions scandal on a "small group" of people and has suspended a number of staff as Matthias Müller was unveiled as its new chief executive.

....Berthold Huber, the acting head of VW's supervisory board, called the crisis a "moral and policy disaster"...."The test manipulations are a moral and political disaster for Volkswagen. The unlawful behaviour of engineers and technicians involved in engine development shocked

Volkswagen just as much as it shocked the public."

This is ridiculous. What incentive do low-level engineers and technicians have to do this on their own? Hell, they couldn't even take on a project like this unless their managers OKed the time to do it, and their managers wouldn't do it unless they were being pressed by higher-ups. Anybody who's ever worked at a big corporation knows this perfectly well. And according to Bloomberg, that's exactly what happened:

Volkswagen AG executives in Germany controlled the key aspects of emissions tests whose results the carmaker now admits were faked, according to three people familiar with the company's U.S. operations.

....Their accounts show the chain of command and those involved in the deception stretched to Volkswagen headquarters.... Ulrich Hackenberg.... Wolfgang Hatz are among those who will leave the company in the wake of Winterkorn's resignation two days ago, two people familiar with the matter said. The two previously ran units at the heart of the affair — Hackenberg, a Winterkorn confidant, was responsible for VW brand development from 2007 to 2013, while Hatz ran the group's motor development from 2007 to 2011.

Will it go even higher? Stay tuned. However, I'll call BS on UBS, which apparently thinks this scandal "could signal the eventual end of the combustion engine." Please. There's no difficulty "amassing accurate data" on engine emissions, as one of their analysts suggests. VW amassed very precise data. They just chose to hide it by means of a calculated, premeditated, multi-year fraud. Anyone who hasn't done the same should be in fine shape.

Legal woes mounting for Volkswagen as criminal cases loom

Volkswagen admitted that 11 million of its diesel vehicles sold worldwide contained software specifically designed to help cheat emissions tests.

By Michael Biesecker and Eric Tucker ASSOCIATED PRESS SEPTEMBER 28, 2015

WASHINGTON — Who knew about the deception, when did they know it, and who directed it?

Those are among the questions that state and federal investigators want answered as they plunge into the emissions scandal at Volkswagen, which has cost the chief executive his job, caused stock prices to plummet, and could result in billions of dollars in fines.

Legal experts say the German automaker is likely to face significant legal problems, including potential criminal charges, arising from its admission that 11 million of its diesel vehicles sold worldwide contained software specifically designed to help cheat emissions tests.

The Environmental Protection Agency has accused VW of installing sophisticated stealth software that enabled ''clean diesel'' versions of its Passat, Jetta, Golf, and Beetle models to detect when they were being tested and emit less-polluting exhaust than in real-world driving conditions. The agency says the ''defeat devices'' allowed those models to belch up to 40 times the allowed amounts of harmful fumes in order to improve driving performance.

The Justice Department says it's ''working closely'' with EPA investigators.

''If there is sufficient evidence to show that Volkswagen intentionally programmed its vehicles to override the emission control devices, the company and any individuals involved could face criminal charges under the Clean Air Act, and for conspiracy, fraud, and false statements,'' said David M. Uhlmann, a former chief of the Justice Department's Environmental Crimes Section

who is now a law professor at the University of Michigan. He called criminal charges ''almost certain.''

But Uhlmann cautioned that hauling the executives involved into a US courtroom could be challenging, because much of the conduct at issue probably occurred overseas. While the United States has an extradition treaty with Germany, European regulators also are investigating and could claim first dibs on prosecuting company officials.

'[Volkswagen is] facing a tsunami of possible state and federal enforce-ment actions.'

William Carter, former federal prosecutor who specialized in environmental crimes

It's not the first time that Volkswagen has been accused of cheating on emissions testing by the EPA. In July 1973, the agency found that VW had installed temperature-sensitive devices that turned off emissions controls on about 25,000 Fastback, Squareback, and bus models. The company agreed to remove the devices and eventually settled with the Justice Department, paying a $120,000 penalty.

Chief executive Martin Winterkorn resigned on Wednesday, and Volkswagen announced it would set aside $7.3 billion to cover the cost of the scandal, but even that may not be enough.

The company has apologized, but has not yet detailed who was responsible for the defeat devices.

German media reported Sunday that Volkswagen had received warnings years ago about the use of illegal tricks to defeat emissions tests. Bild am Sonntag said VW's internal investigation has found a 2007 letter from parts supplier Bosch warning Volkswagen not to use the software during regular operation. Frankfurter Allgemeine Sonntagszeitung said a Volkswagen technician raised concerns about illegal practices in connection with emissions levels in 2011.

A Volkswagen spokesman declined to comment on the reports.

The Clean Air Act allows for fines of up to $37,500 for each of the 482,000 suspect VWs sold in the United States, potentially totaling more than $18 billion. Attorneys general for nearly 30 states and the District of Columbia have announced a coordinated investigation and said they are issuing subpoenas for company records.

There's also a high likelihood of class-action lawsuits by angry VW owners.

''They're facing a tsunami of possible state and federal enforcement actions, and a potential large number of violations — including administrative, civil, and criminal,'' said William Carter, a former federal prosecutor in Los Angeles who specialized in environmental crimes and served as general counsel of the California Environmental Protection Agency.

Investigators will almost certainly look for any false statements made to the EPA and for signs that VW has tried to conceal wrongdoing or obstruct regulators. Fraud charges could be considered if evidence emerges that company executives used the Internet or the mail system to carry out the deception. And money laundering allegations will be explored if investigators suspect that VW sent illicit proceeds overseas.

''If a software package such as this were intentionally designed to defeat the emissions testing, there may well be e-mail traffic, meetings, records that would establish that intent,'' said Gregory Linsin, a former environmental crimes prosecutor at the Justice Department.

But Linsin said he expected the Justice Department also to take into account the multiple investigations likely to take place worldwide, and to not punish the automaker in a way that jeopardizes its ability to stay in business.

The problems at VW come as the Justice Department faces growing pressure to prosecute individual executives and employees for corporate misdeeds. The last two major criminal investigations against auto companies — Toyota and General Motors — yielded massive fines over car safety problems but have resulted in no prosecutions of executives. Those outcomes dismayed consumer watchdog groups and grieving victims' relatives, who demanded better accountability for failure to disclose vehicle defects.

A memo this month by Deputy Attorney General Sally Yates sought to reaffirm the Justice Department's commitment to prosecuting employees and executives, directing among other policy mandates that corporations pushing for credit for cooperating with the government must first turn over evidence against individuals.

''Volkswagen has a fundamental choice to make,'' said Uhlmann, the former prosecutor. ''That is whether it intends to cooperate and seek leniency, or whether it wants to fight the charges. Every indication over the last several days from Volkswagen is that it intends to cooperate.''

Asked whether that meant he expected company executives to voluntarily come to the United States to stand trial, he laughed.

''Absolutely not,'' he said.

Sell, sue or stay put: considerations for Volkswagen owners

Tom Krisher and Dee-Ann Durbin

Updated: 27 September 2015 11:10 PM

DETROIT — If you're driving a diesel-powered four-cylinder Volkswagen, you're stuck with a fun-to-drive machine that's belching unhealthy pollutants from its tailpipe.

Until the company figures out how to fix its bogus emissions controls, there isn't much you can do about your dirty diesel.

Following disclosures that Volkswagen developed software for its 2-liter diesel engine that could better control pollutants during testing than in real-world driving, there's a lot up in the air for owners of Jettas, Golfs, Passats and Beetles and Audi's A3.

Here are some things to consider if you're thinking of suing, selling or are unsure of what to do next.

The problem

VW's software turned on pollution controls for government tests, which are done on a treadmill device called a dynamometer. When the software deduced that the cars were back on the street, the controls went off and the cars polluted too much. About 500,000 of the cars were sold in the U.S.

VW hasn't said how it will fix the problem.

Owners worry the repairs will cut fuel economy and performance — the reasons they bought the "clean" diesels in the first place.

"I really hope they fix this thing," said Zandy Hartig, an actress in Los Angeles who owns a diesel 2013 Jetta SportWagen. "I assume since they did it on purpose they can undo it."

The EPA has told VW to fix the cars so they comply with pollution regulations, but there's no word from the company on how or when that will be done. The EPA said it could take a year.

"We understand that owners of the cars affected by the emissions compliance issues are upset," VW said on a consumer website launched Sunday. The company asked for patience and said it would address the issue as fast as it can. A spokeswoman wouldn't comment further.

A recall fix may be coming soon for 2015 and 2016 models, neither of which can be sold until repairs are made. Mike Jackson, CEO of AutoNation, the country's largest auto dealership chain, said that he was told by VW officials that a software change will bring the last two model years into compliance.

But it's a mystery how the company will fix models from 2009 through 2014, including whether software and equipment changes will be needed, he said.

Did my car lose value?

Worried about their cars losing value, some owners might rush to put the car up for sale.

Eric Ibara, senior analyst for Kelley Blue Book, is encouraging owners to hang on to their VWs, at least until the company comes up with a fix.

Ibara said the impact on VW's resale values may not be known for two or three weeks. The price that dealers agree to pay for vehicles being auctioned this week will be the first indication.

VW diesels traditionally have higher resale values than gasoline counterparts, but the scandal might erode that premium, Ibara said, especially if the fix cuts mileage or impacts their sporty performance.

If repairs are made, history shows there might not be a lasting impact. General Motors' residual values weren't affected by ignition switch recalls, and Toyota's car values returned to normal within a year of an unintended acceleration crisis.

Some owners are hoping for rebates, while a consumer group called on VW to buy back the diesels.

Legal action?

Joining a lawsuit against VW is one option for owners, although it is likely to take years to get any relief.

Several U.S. lawsuits have been filed, some alleging the cars' values will fall because of the scheme.

Consumers could have some success in the courtroom. In 2012, for example, Toyota agreed to pay more than $1 billion to resolve hundreds of lawsuits filed by owners who said their vehicles lost value after the company's unintended acceleration problems.

Also, politicians are calling on the Federal Trade Commission to investigate, because VW often advertised the cleanliness of the vehicles. The FTC, which monitors advertising claims, can seek remedies for all of the car owners.

Don Marron, 58, a banker from Allentown, Pa., wants Volkswagen to take back his 2012 SportWagen and apply the credit toward a new car. He'd also consider a repair that didn't compromise performance or fuel economy.

"I'm going to wait and see what they do, but I'm not going to do nothing," he said. "It's just dumb that they did this. How could they think that it wasn't going to be discovered? What arrogance, what bad judgment."

http://www.wsj.com/articles/auto-parts-makers-hit-by-vw-scandal-1443395198

Auto-Parts Makers Hit by VW Scandal

Suppliers move to defend diesel technology, fearing shift toward alternatives

By JEFF BENNETT

Updated Sept. 27, 2015 7:50 p.m. ET

Auto-parts makers with big exposure to the diesel-car market are racing to salvage the technology's reputation in the wake of the Volkswagen AG emissions-cheating scandal.

Shares of the parts makers, which include Tenneco Inc., BorgWarner Inc., Delphi Automotive PLC and Continental AG, were pummeled last week following the Environmental Protection Agency's disclosure that VW cheated for years on emissions tests of its diesel-powered cars.

The parts industry's focus has shifted to defending the viability of diesel technology amid concerns that betrayed consumers or auto makers, which face tighter government scrutiny of diesel, will turn their attention to hybrids and electric-powered vehicles.

"You can't have an event like this without questions being raised, but that doesn't mean the technology doesn't work," said Terrence Hahn, chief executive of Honeywell International Inc.'s $3.8 billion Transportation Systems unit.

"We have seen proven results around clean-diesel technology, and we don't want what one auto maker has done to tarnish the industry or the technology," Mr. Hahn said.

Wall Street wasn't convinced, however. Shares of Honeywell, a major supplier of the turbochargers often used to make diesel-powered cars peppier, fell 10 cents Friday to $93.52, down about 5% from their close on Sept. 18. That was the day the EPA accused VW of installing illegal software that sharply reduces nitrogen-oxide emissions, but only when the cars are undergoing strict emission tests.

VW later acknowledged its use of the software and issued an apology.

The company promised to find a remedy to repair the 482,000 VW diesel cars in the U.S. as soon as possible. On Sunday, it launched the website vwdieselinfo.com to tell VW diesel owners about the company's plans to fix their vehicles.

Shares of Tenneco, which makes emissions systems and gets 8% of its revenue from VW, sank almost 8% last week, while those of BorgWarner, which generates 17% of its revenue from the auto maker, fell 6%, finishing the week at $40.

BorgWarner recently opened plants in Portugal and South Korea, partly to produce more components used in starting diesel engines.

Continental, a German supplier of engine components, also was under pressure. Its stock lost nearly 6% of its market value last week.

Closely held Robert Bosch GmbH, the German giant that supplied the components now at the center of the emissions probe, has said VW was responsible for how the parts were installed.

On Friday, the EPA indicated it would step up scrutiny of diesel vehicles by overhauling the way it oversees the industry's compliance with emissions standards.

The regulator sent a letter to auto makers saying that it will conduct tests of 2015 and 2016 vehicles under normal driving conditions, rather than accepting lab results, as it has done in the

past.

In the U.S., diesel engines are largely confined to heavier trucks, with diesel-powered cars representing just a small part of the passenger-car market. But diesel is dominant in Europe, accounting for more than 50% of the passenger-car market in 2015, according to Barclays.

Before the scandal broke, J.D. Power & Associates expected diesel to expand to 7% of the U.S. light-vehicle market by 2017 from 3% this year.

Barclays analyst Brian Johnson suggests those growth expectations need to change, both in the U.S. and Europe. And that will squeeze some parts makers.

"Whatever the specifics that emerge from a VW investigation, we believe strongly that the VW scandal will heighten the pressure on diesel in Europe," he said in a research note last week.

"The end result of the VW issues will be to accelerate a move away from diesel in the European mass market, pressuring suppliers leveraged to diesel," Mr. Johnson said.

Mike Jackson, chief executive of AutoNation Inc., the largest U.S. auto retailer, said it would tough to rebuild trust with potential diesel buyers in the U.S. "It is another black eye for diesel engines overall," he said.

Mr. Johnson of Barclays added that auto makers might need to accelerate development efforts of electric vehicles, hybrid and more-efficient gasoline engines.

That could help parts makers, since many of the same companies will have to supply those component. But their investments in diesel-powered cars could be lost if the industry shifts to those alternatives.

Telegraph (UK):

http://www.telegraph.co.uk/finance/newsbysector/industry/11895848/BREAKING-2.1-million-Audi-cars-fitted-with-VW-emissions-cheat-devices.html

VW scandal: German prosecutors probe Winterkorn as Volkswagen emissions-rigging crisis spreads to 2.1 million Audi cars and Skoda models

By Julia Bradshaw10:31AM BST 28 Sep 2015

Prosecutors in Germany have opened a criminal investigation into former Volkswagen chief executive Martin Winterkorn in the wake of the emissions-rigging scandal.

The probe is understood to concentrate on accusations of fraud after it was revealed that VW had fitted 'defeat' devices in millions of its diesel cars worldwide to cheat government emissions tests.

The investigation aims to establish who was responsible, according to the statement from prosecutors in Braunschweig, Germany, and will look at Mr Winterkorn's role in the worst crisis to hit VW in its 78-year history.

The prosecutors have also received a number of criminal complaints, including one from Volkswagen itself.

Winterkorn quit saying he was "not aware of any wrongdoing on my part"

Under the German system, anyone can file a criminal complaint with prosecutors, who then must examine the complaint and decide whether there is enough evidence to open a formal investigation and for charges to be brought.

It is essentially the equivalent of a police investigation in the UK.

Prosecutors say it is too early to determine if and when they may try and interview Mr Winterkorn himself.

"This is a very broad case and in other such investigations it has taken many months, sometimes years," a spokesman said.

Mr Winterkorn stepped down as CEO last week and was replaced by former Porsche boss Matthias Mueller after the emissions-rigging scandal wiped billions of pounds off the value of VW and tarnished its previously solid reputation for reliability and quality.

Mr Winterkorn has denied knowing about the pollution-cheating software, and issued a statement at the time of his resignation saying: "I am doing this in the interests of the company even though I am not aware of any wrongdoing on my part."

Dr Hans-Christoph Hirt, a director at fund manager Hermes, criticised VW's choice of corporate insiders to take charge of the company, saying the move "raises some real doubts whether the key shareholders have recognised the need for fundamental reform and a real new beginning".

He said: "Following intensive engagement with Volkswagen on corporate governance issues between 2006 and 2009, we have repeatedly raised concerns about aspects of Volkswagen's corporate governance.

"We plan to attend the Extraordinary General Meeting of Volkswagen on November 9 and on behalf of a group of investors will explain our concerns and suggest changes to the company's corporate governance and culture to other shareholders and the management and supervisory boards."

The news came as Audi announced that the device used in parent company Volkswagen's cars to manipulate emissions tests was also fitted in 2.1 million of its own luxury cars.

Of the 2.1 million autos, some 1.42 million diesel-powered Audi vehicles are registered in Western Europe, with 577,000 in Germany.

There are almost 13,000 cars containing the cheat software in the United States, a spokesman for Ingolstadt-based Audi said today.

The engine in question was built into 1.6-litre and 2-litre turbo diesel models in the A1, A3, A4, A6, TT, Q3 and Q5 ranges.

The cars involved have engines in the "euro 5" emissions category. Those with the newer "euro 6" engines aren't affected by the emissions scandal.

"We're working at full speed to find a technical solution," said Juergen de Graeve, a spokesman for Audi.

"Once we have that solution, we'll write to customers and we'll upgrade the cars so that they're within emissions regulations."

Skoda, which is also part of the VW family, has said that 1.2 million of its cars worldwide contain the software cheat, according to reports.

Volkswagen shares have fallen by more than 7pc so far today.

It has also emerged that VW has suspended the R&D chiefs of its core VW brand, luxury division Audi and sports-car maker Porsche, sources familiar with the matter told reporters.

The carmaker's supervisory board last Friday agreed to put a number of employees on leave until the details of affair were cleared up.

VW sparked global outrage last week when it admitted that 11 million of its diesel cars are fitted with special gadgets that activate pollution controls during tests but secretly turn them off when the car is on the road.

The deception has wiped billions off the value of the car giant and is set to land the German auto maker with substantial penalties and recall costs as governments and regulators around the world launch investigations - some of the criminal - into the scandal.

The nations carrying out probes include the UK, South Korea, India, Brazil, Australia, France, Italy, South Africa and Norway - whose economic crime unit has opened an investigation.

The US Justice Department has also launched a criminal probe.

Executives at VW have been accused of masterminding the emissions scandal from the company's headquarters in Wolfsburg.

The chain of command of those involved in the rigging deception stretched all the way back from the US to VW's home patch, it has been claimed, with executives in Germany controlling the key aspects of tests which the firm now admits were manipulated.

It was said that the cars that missed US emissions targets were reported to managers in Wolfsburg.

Testers at a California site evaluated vehicles and results were sent back to Germany before

being passed to the US Environmental Protection Agency.

If any car failed to meet emissions targets, a team of engineers from Volkswagen headquarters or Audi's base in Ingolstadt was flown in.

UK Prime Minister David Cameron has condemned Volkswagen over its rigging of emissions tests.

"If companies are breaking the rules and fiddling their figures, that is unacceptable," Mr Cameron said as he flew to New York for a visit to the United Nations. "Emissions standards matter and they have to be properly policed and delivered."

Any move to restrict sales would be "all a matter for the Transport Department," he said.

German authorities have also demanded the carmaker present a timetable for fixing affected vehicles.

The regulators have asked VW to come up with a plan by October 7 to show when its cars will meet emissions requirements.

The German government has also insisted that it did not know about the rigged diesel emissions tests at VW before the story broke.

"The transport minister found out about the allegations of manipulation the weekend before last," a spokesman said.

"We had no previous knowledge that this system was being used."

Volkswagen has set aside €6.5bn to cover damages including fixes for the vehicles, potential regulatory fines and lawsuits, but the cost of the fallout is expected to be much larger.

The FBI in Detroit is reportedly handling a US criminal investigation of the German company, while 27 state attorney generals have unleashed a joint investigation into the blighted car maker.

Thse 27 states are reportedly going to send subpoenas to the company - these are essentially writs compelling testimony or evidence to be produced or face a penalty.

Private law firms are also lining up to take on VW, with a class action suit already being filed by a Seattle law firm.

The automobile giant already faces at least 60 lawsuits filed in federal courts in the US by consumers alleging the company committed fraud by cheating on emissions tests, which means their cars might not be as efficient as they believed them to be.

Dutch investor group VEB, which represents shareholders, has issued a liability claim against Volkswagen for the losses incurred by investors in the wake of the emissions fraud.

The group said: "The liability in question concerns the incorrect, incomplete and misleading information provided by Volkswagen…this manipulation kept the Volkswagen share price artificially high.

"In doing so Volkswagen acted unlawfully; not only towards car owners but also its own shareholders."

Meanwhile, European environmental organisation, Transport & Environment, has said it has found some new models of Mercedes, Volkswagens, BMWs and other new cars consume much more petrol than lab tests claim, according to reports from PA.

The organisation said it had found no proof the cars are equipped with the same sort of "defeat devices" installed on diesel-powered Volkswagens, but called on European Union governments to broaden their probes into the scandal to cover petrol cars as well.

Both the EU and US have announced plans to crack down on the way car emissions are measured.

Currently, manufacturers test emissions in near-perfect lab settings, using smooth tyres unsuitable for roads, engine lubricants so expensive they're beyond the reach of most consumers and even clip off wing mirrors to achieve required emission results.

US regulators and the European Commission have both said they will introduce rules forcing manufacturers to test car emissions under real world road conditions.

The EU is expected to introduce new legislation in early 2106, although French ministers on Thursday called for this to be brought forward to before the end of the year.

New VW boss Matthias Mueller has pledged to win back the trust of customers.

"My most urgent task is to win back trust for the Volkswagen Group by leaving no stone unturned and with maximum transparency, as well as drawing the right conclusions from the current situation," he said on Friday.

Despite the turmoil at VW, the European Central Bank has not suspended the purchase of assets backed by VW loans, under its quantitative easing programme.

Contrary to reports over the weekend, the latest list of eligible collateral purchased by the ECB still includes securities issued by the carmaker.

Dispatch Times:

http://www.dispatchtimes.com/what-to-do-if-you-have-volkswagen-affected-by-the-emissions-scan/106617/

What to do if you have Volkswagen affected by the emissions scan

BY NEWSMEDIAON SEPTEMBER 28, 2015

Regulators will add more spot-checks to cars already on the road as part of a toughening of USA environmental oversight following Volkswagen's admission that it fitted as many as 11 million diesel cars worldwide with software that rigged pollution tests.

The software tells a auto when it is under an official test, triggering emissions control systems that do not seem to be operating under normal driving conditions.

Volkswagen appointed Matthias Mueller as its new chief executive officer, to help the German automaker recover from a scandal over its rigging of USA vehicle emissions tests.

"We are not going to tell them what these tests are; they do not need to know", said Christopher Grundler, director of the EPA's Office of Transportation and Air Quality.

EPA officials insisted on a call with reporters Friday that the previous testing procedures were sophisticated and sufficient to accurately detect the emissions from the diesel cars as long as a manufacturer is not deliberating trying to cheat the process.

The EPA move comes amid a widening scandal over Volkswagen's diesel vehicles, as the automaker has admitted it installed a cheat device to remove nitrous oxide from exhaust emissions during lab testing. Volkswagen CEO Martin Winterkorn issued an apology, stating that he was "deeply sorry that we have broken the trust of our customers and the public".

The EPA's findings regarding the scandal saw that 482,000 cars in the U.S. were involved including the brands made by VW such as the Audi A3 and the VW models Jetta, Beetle, Golf and Passat.

The US Department of Justice (DoJ) has said that the United States would be taking part in an investigation by the Environmental Protection Agency (EPA) into the vehicle company.

Why did successive governments not discourage the proliferation of diesel vehicles which now account for about half of new cars in Britain?

The Air Resources Board sent a letter to all vehicle manufacturers Friday notifying them of the change that will be effective immediately.

Private owners of the 2009-15 VW and Audi models equipped with the violating 2.0-liter diesel may continue driving the cars, and do not have to do anything until Volkswagen of America and the EPA agree on a timeline for a recall.

The Academic Paper That Broke the Volkswagen Scandal

Last year, a group of researchers at West Virginia University uncovered one of the biggest frauds in automotive history while working under a small $50,000 grant.

BOURREE LAM 1:23 PM ET

Every day since the story first broke a week ago, the ripples of Volkswagen's scandal have extended further and further. Initially, the Environmental Protection Agency ordered Volkswagen to recall nearly half a million vehicles after discovering illegal devices intended to cheat emissions testing. Then, Volkswagen announced the number of vehicles affected is closer to 11 million worldwide—and that the company has set side $7.2 billion to fix the problem. Volkswagen's CEO at the time, Martin Winterkorn, soon resigned.

The company's board is expected to pick Matthias Mueller, the chief executive of Porsche, to take over. There are reportedly nearly 30 class-action lawsuits pending from car owners in all 50 states, plus 5 provinces in Canada. All these furious drivers bought their cars believing that they were highly fuel-efficient—which appears to not be the case, affecting their resale values significantly.

But how did this whole thing begin? At a small lab in West Virgina, it turns out. In 2012, a group of researchers at West Virginia University won a $50,000 grant from the International Council on Clean Transportation to do performance testing on clean diesel cars. Arvind Thiruvengadam, a research assistant professor in mechanical and aerospace engineering, told NPR this week that the team was merely excited do the research—which involved driving the clean diesel cars outside the lab—and write a journal paper based on the data. They never expected that they would discover one of the biggest frauds in automotive history.

When Thiruvengadam and his colleagues tested Volkswagen's clean diesel cars, they found discrepancies up to 35 times the expected emissions levels. The researchers suspected cheating, but couldn't be sure. David Carder, another researcher on the West Virginia University team, told Reuters that the fallout at hand is surprising because this data was made public over a year and a half ago.

The stakes were upped when the Volkswagen cars in question were tested by the California Air Resources Board (CARB) in an investigation starting May of last year, and the CARB and EPA started discussions with Volkswagen on why there were such discrepancies. Volkswagen insisted

to EPA officials that the discrepancies were due to a technical issue rather than deliberate cheating. Only when the EPA threatened not to approve Volkswagen's 2016 clean diesel cars for sale in the U.S. did the company finally fess up.

Volkswagen will survive this scandal (even though its stock has plunged 30 percent, wiping out a quarter of its market value), but now the future of diesel cars are at stake and it's expected that the consumers who wanted clean diesel cars for their greenness will likely switch to hybrids, while those who care for performance might try to dodge the recall. Either way, Volkswagen will be held responsible for clean diesel's coming existential crisis.

Does EPA's Response To Volkswagen's Emissions Cheating Go Far Enough?

By Cole Stangler

Auto regulators are now on the offensive after being deceived by Volkswagen for years. They unveiled a response Friday to the company's stunning admission that it systematically cheated on emissions tests from 2009 to 2015. In a letter to automakers, the U.S. Environmental Protection Agency said it will bolster testing procedures to detect so-called defeat devices like the ones Volkswagen used to shut down pollution control systems outside of testing conditions.

Jesse Prentice-Dunn, a policy analyst at the Sierra Club, applauds the move. But he says "long-term" fixes are still needed. "The testing regime needs to be revamped."

Critics have long said as much. Under the current testing system, automakers in the United States conduct their own examinations and report the data to federal officials. The EPA, meanwhile, conducts spot checks, but its resources are stretched thin.

Dan Becker is the director of the safe climate campaign at the Center for Auto Safety. For companies to respect emissions standards, he says, officials need to remove the tests from private hands and transfer them to labs with federal supervision. "Right now, you've got the foxes in control of the chicken coop, and that's never going to be a good show."

In an ideal world, Becker says, automakers would simply follow the law. But in the last few decades, companies have shown a remarkable penchant for gaming the standards, and the current structure of the testing system makes it exceedingly easy to do so.

"If these companies were being honest, we wouldn't need an elaborate system to make sure they don't cheat," Becker said. "But they've proven that they do cheat." Not just Volkswagen -- but "virtually every major automaker," he asserted.

A History of Gaming The System

It started in the 1970s, just after the EPA was created and began to regulate auto emissions under the Clean Air Act. Volkswagen, in fact, was among the first to equip its cars with defeat devices to override emissions control systems. In 1973, it confessed to installing them on 25,000 cars. The following year, Chrysler was forced to recall more than 800,000 cars after it was found to have installed a similar device in radiators.

The 1990s saw a couple of major scandals. In 1995, General Motors settled with the Justice Department and the EPA for $45 million, acknowledging it installed a computer chip in 500,000 Cadillacs that tripled the amount of carbon monoxide output when the cars' heating and cooling systems were running. Three years later, Caterpillar, Mack Trucks and Volvo Trucks reached a similar settlement, worth $1 billion, for equipping trucks with defeat devices.

Kia and Hyundai followed suit more recently. Last November, the South Korean corporations copped to overstating fuel economy standards on 1.2 million cars from 2010 and 2012, settling with the Justice Department and the EPA for $300 million.

A representative for the Alliance of Automobile Manufacturers, a trade group that represents automakers operating in the United States, declined to comment.

What Is To Be Done?

The Sierra Club's Prentice-Dunn says one path to reform could simply be to increase the number of spot checks. Indeed, Christopher Grundler, director of the EPA's Office of Transportation and Air Quality, recently told the Associated Press that the agency may soon do this.

Grundler was less forthcoming about the EPA's plans to enhance detection of defeat devices -- the subject of Friday's letter to automakers. On a call with reporters, he wouldn't say what changes the agency is enacting to audit lab results submitted by car companies.

"They don't need to know," he said, of the automakers. "They only need to know that we will be keeping their cars a little bit longer, and we're going to driving them more."

Becker says more oversight is a good step, but regulators need to go further by eliminating their reliance on companies' test data altogether.

"This is an industry that has proven it's not trustworthy," said Becker. "The EPA shouldn't trust them when they say, 'our vehicles meet your standards, everything's just peachy keen.' The government needs to set up a better testing system and not rely on the auto companies' assertions."

He's not sure exactly how that would look -- whether it would be in-house or conducted at independent labs with federal supervision -- either way, he says, it would need to be firmly outside the control of companies. Taxpayers, in theory, could cover a portion of the cost, but companies should be forced to foot most of the bill.

Congressional Republicans, who have made frequent targets of the EPA, would likely oppose such a plan. Since 2010, the agency has seen its budget decline by a fifth, or about $2 billion. Earlier this month, 20 Republican members of Congress filed articles of impeachment against Gina McCarthy, head of the agency.

Luke Tonachel, director of clean vehicles and fuels at the Natural Resources Defense Council, says all this makes it harder for the agency to do its job. "If the EPA's resources are constantly under attack, it's only gonna be harder for them go out and catch the cheaters."

Former GM Vice Chair: "I almost feel sorry" for Volkswagen

by Chris Matthews

Bob Lutz says the competition wondered how VW could get low emissions cheaply

For six years, Volkswagen has been installing software in its cars to help them cheat on EPA emissions test. As former GM Vice Chair Bob Lutz told CNBC Friday, the rest of the industry was wondering just how the company was able to get clean emissions so cheaply.

Lutz said that he consistently pressed his engineers to figure out what his competitor was doing, ""They said, 'We can't answer that question," according to Lutz. "Honda asked the same

question. They couldn't figure it out either because with near identical engines and hardware from the same suppliers, they could not get themselves to pass."

Lutz also predicted that to fix the problem will be, "incredibly expensive" after factoring in government fines and consumer lawsuits for complaints like loss of value. He even went so far to say that he "almost" feels sorry for his former competitor.

Volkswagen Whistleblower: "We Gave EPA The Diesel Emissions Data In 2014"

By Mike Brown

The Volkswagen scandal has shaken the automotive world. It all started with two men: Peter Mock and John German. The pair worked with West Virginia University to try to show that clean emissions tech doesn't necessarily effect automotive performance. Instead, they discovered that the chosen cars were pumping 40 times more emissions into the air than they were supposed to. They submitted their findings to the California Air Resources Board and the federal Environmental Protection Agency.

This week, German, senior fellow at the International Council on Clean Transportation, suddenly became one of the key figures in a story about how the global car manufacturer had cheated on

EPA emissions tests. The shocking revelations have had widespread impact on the industry and started an international conversation on emissions testing. They also cost Volkswagen CEO Martin Winterkorn his job. Here, German speaks to International Business Times about how Volkswagen got away with it, the wider implications, and what happens next.

International Business Times: Now, as I understand it, Volkswagen was using a "defeat device" to measure the conditions of the car, but this wasn't actually a device. It was a piece of software, correct? What was that software measuring for?

John German: We don't know. You are correct it is software, it has to do with the computer looking for the conditions under which test procedure was conducted, and if it detects the conditions, the emission controls behave the way they were designed. But if it does not detect those conditions, it switches to a different control where it reduces the effect of the system. The specifics as to how they reduce effectiveness, though, we don't know. There's quite a number of ways they could detect how they could see that the car was being tested.

IBT: Who could have known about this?

German: One aspect that's really interesting is that we turned data and report over to CARB and the EPA back in May 2014 and they discussed the problems with Volkswagen. Then in December 2014, Volkswagen issued a field fix, and they reflashed the computers in the cars to install the field fix. A few months later they assessed, and found the defeat device was still in the field fix. That is incomprehensible to me, so the interpretation is that this was only a relatively small part of the company.

IBT: Is this something that's ever happened before?

German: There have been a number of other defeat device cases. The best-known case was in the late 1990s with heavy-duty engine manufacturers, ones for really big freight trucks. They did something similar; they were concerned with driving long distances. So they looked for a steady state highway speed for more than x mins, after which they would change calibrations, pushing the NOx up.

IBT: But I'm assuming before they didn't have as advanced computers and electronics. How did they control it before?

German: The systems were simpler. Before NOx after treatment, it was all in calibration. One example of this was what's known as exhaust gas recirculation. That was the first step of control. You could put in one of those to reduce NOx, but it would also increase fuel consumption, so you could switch it off.

IBT: When will we find out what Volkswagen was doing? Are we talking more in months or years?

German: We will only find out if CARB or EPA reveal it. It might be part of the settlement with Volkswagen, as part of the legal agreement. There is a good chance that the EPA will release the info, but we're probably talking more in months. At this stage, though, it's definitely in Volkswagen's interest to get it fixed and behind them as fast as possible.

IBT: Could we conduct tests to find out for ourselves how Volkswagen were doing this?

German: Maybe. It would be difficult. The kind of time and expertise it takes to reverse-engineer calibrations ... these computers are really powerful and complex, and it would take a large amount of time and expertise.

IBT: But we know the car was looking for certain conditions. What are these conditions they could have been measuring for?

German: There are several factors. On an official test the non-drive wheels don't spin, the front wheels do not turn. The test is run at a consistent ambient temperature. It's always run with a cold engine, and the test has a defined speed trace, i.e. the speed for each second. Volkswagen could have looked for any of those.

IBT: Thank you for your time, this has been very interesting. Is there anything else you wanted to say about this that you don't think we covered?

German: The main point is that governments need to do a better job of oversight and enforcement. Worldwide, in China, India, Brazil ... the primary lesson is that there needs to be better oversight and more data.

EPA works with Canadian regulators to retest VW vehicles

U.S. regulators warn they will revamp testing protocols after learning of VW cheat device

The U.S. Environmental Protection Agency is looking to revamp the way it tests emissions for all automobiles in the wake of the scandal over Volkswagen's manipulation of emissions data.

The EPA will also be working closely with Environment Canada, which has an "excellent laboratory," to co-ordinate widespread testing around the Volkswagen emissions, EPA officials said in a conference call on Friday.

Affected vehicles have yet to be recalled, but the EPA said it is looking for "recall solutions." Part of the problem is that there is no fix that won't negatively impact vehicle performance.

An estimated half million vehicles in the U.S. are affected, with Environment Canada estimating 100,000 VW diesels are in service in Canada.

The EPA said it is sending a letter to automakers outlining plans for more extensive testing of all vehicle models.

That echoes an initiative by European regulators, who plan to move in 2017 to a system of road testing for vehicle emissions standards.

Light commercial trucks

The EPA move comes amid a widening scandal over Volkswagen's diesel vehicles, as the automaker has admitted it installed a cheat device to remove nitrous oxide from exhaust emissions during lab testing.

On Friday, Germany's transport minister said that light commercial trucks made by Volkswagen appeared to have the same software geared toward cheating on U.S. emissions tests.

Transport Minister Alexander Dobrindt told lawmakers Friday that 2.8 million vehicles in Germany may be affected.

Meanwhile, Daimler AG, the maker of Mercedes cars, is rejecting claims by a German environmental group that it appears to have been involved in manipulation of emissions data.

The Deutsche Umwelthilfe group said Friday it had information that almost all German manufacturers of diesel cars exceed emissions limits and speculated that the cars were declared road-worthy by regulators because of cheat devices.

"We sharply deny the allegation that we manipulated our cars during emissions tests. We never did and do not now use a defeat device," Daimler said in a statement.

Questions over emissions testing

Volkswagen cars as far back as 2009 are equipped with the defeat software that is geared toward passing emissions standards.

The revelation has put the EPA, and testing agencies around the world, on the alert.

Chris Grundler, head of the EPA's office of transportation and air quality, was clearly on the defensive, saying the EPA had left it to European regulators to do more extensive tests of diesel as the fuel is in wider use there.

It wasn't the EPA that uncovered the high nitrous oxide emissions from VW diesel cars, but the International Council on Clean Transportation (ICCT), a nonprofit research organization based in Virginia.

"Do I wish we had uncovered it sooner? Absolutely," he said.

VW was able to fool the EPA because the agency only tested the cars on treadmill-like devices called dynamometers and didn't use portable test equipment on real roads. The software in the cars' engine-control computers checked the speed, steering wheel position, air pressure and other factors to determine when dynamometer tests were under way. It then turned on pollution controls that reduced the output of nitrogen oxide, an ingredient in harmful ozone, the EPA has said.

The agency does have on-road testing equipment, but it is used to monitor automaker gas mileage estimates and heavy-duty diesel trucks, which create more emissions.

"It's not a question of equipment or technology or capability. It's a question of where we deploy those resources," Grundler said.

Any new testing will include investigations that will uncover any software designed to fool emissions testers, Grundler said.

More extensive road testing is also on the way, he warned automakers, though he did not specify exactly which tests the EPA plans.

The scandal has also exposed holes in the European testing system, where tests are done in laboratory conditions on special pre-production models provided by the manufacturers. Norway, France and Italy announced moves today to investigate VWs sold in their countries.

Europe's tests have not been upgraded since 1996 and critics say its testing is less rigorous than North American testing.

The EU has proposed real-world testing from 2017, with new proposals to close loopholes and design testing to more closely resemble real-world road conditions.

ICCT testing of diesel cars hints at trouble for many automakers around diesel emissions, with poor results for Volvo, Renault and Hyundai as well as Volkswagen.

scandal/72794218/

EPA expands emissions tests in wake of VW scandal

By Greg Gardner

The EPA also will test diesel vehicles produced by other automakers.

The U.S. Environmental Protection Agency will introduce new tests to detect devices like the one Volkswagen used to cheat on its emission test to comply with the Clean Air Act, agency officials said today.

The German automaker said Matthias Mueller, currently the head of its Porsche unit, will become CEO, replacing Martin Winterkorn who resigned earlier this week because of the emissions cheating scandal.

The EPA apply the new regimen to diesel vehicles produced by other automakers. The agency is also asking owners to allow EPA researchers to test their diesel vehicles to learn more about how the German automaker disguised their violations, that could lead to a fine of up to $18 billion in the U.S. alone. More broadly Volkswagen has said 11 million vehicles worldwide used some type of software to game various countries' environmental standards.

"We're going to adapt new practices and more demanding tests to improve our enforcement," said Chris Grundler, director the EPA's office of transportation & air quality. "We are not going to tell manufacturers what these new tests are. They don't need to know."

In the U.S., the EPA found that 482,000 Volkswagen cars sold between the 2009 and 2015 model year used a defeat device when testing the vehicles.

They include:

Jetta (model years 2009-15)

Beetle (model years 2009-15)

Audi A3 (model years 2009-15)

Golf (model years 2009-15)

Passat (model years 2014-15)

Without the defeat devices, which were deactivated after Volkswagen met the emission requirements, the VW and Audi vehicles were emitting nitrogen oxides (NOx), a greenhouse gas, at levels up to 40 times the permissible standard.

Grundler and Janet McCabe, EPA acting assistant administrator for the office of air and radiation, asserted that neither their agency nor the California Air Resources Board, which can also penalize Volkswagen and Audi, don't allow any manufacturer to "self-certify," or conduct their tests without regulatory involvement.

EPA and CARB uncovered the defeat device software after independent analysis by researchers at West Virginia University, working with the International Council on Clean Transportation, a nongovernmental organization.

Grundler said EPA has the money and staff to expand its emission testing.

"We have the equipment. We have the people. We have 23 of these measurement systems and they are not cheap," he said.

Washington Post:

http://www.washingtonpost.com/business/economy/epa-to-begin-more-rigorous-testing-of-all-

diesel-cars-after-vw-scandal/2015/09/25/f20fa39a-6393-11e5-8e9e-dce8a2a2a679_story.html

EPA to begin more rigorous testing of all diesel cars after VW scandal

By Thad Moore

Federal regulators are launching more aggressive testing of diesel-engine cars across all manufacturers in the wake of the Volkwagen emissions-cheating scandal, the Environmental Protection Agency said Friday.

The EPA also says it will add additional tests designed to ferret out "defeat devices" like the software VW used to circumvent emissions tests.

The agency had been focused its diesel testing on big-rig trucks because they are more common than diesel cars and account for more pollution in the U.S., said Christopher Grundler, director of the EPA's Office of Transportation and Air Quality.

The EPA will begin testing cars Friday, Grundler said, and it will seek out test vehicles from rental car fleets and consumers. The agency doesn't know how long the testing would take, but Grundler said it is working with regulators in California and Canada to speed the process.

VW acknowledged that 11 million of its vehicles worldwide, including nearly 500,000 in the United States, were involved in a deception that allowed the vehicles to pass emissions tests while emitting nitrogen oxide at up to 40 times the federal standard. Its' CEO, Martin Winterkorn, stepped down this week and the company is under criminal investigation and faces billions in fines. VW also set aside more than $7 billion to fix the problems with its cars and begin to repair its reputation with customers.

Neither the EPA nor Volkswagen have said how long it will take to fix the nearly half-million cars in the U.S. with defeat devices. But it expects cars in the 2015 model year will be patched "relatively quickly," Grundler said.

Older versions of the Passat should be fixed soon after that, but other models will take longer because designing a solution "will require additional engineering development that will take longer," Grundler said.

EPA Beefing Up Emissions Tests in Wake of VW Scandal

The agency also says it plans to test gasoline and diesel vehicles that are on the road today.

By Alan Neuhauser

One week after Volkswagen copped to cheating on federal emissions tests of popular VW and Audi "clean-diesel" cars, the Environmental Protection Agency sent a letter to vehicle manufacturers Friday announcing it was toughening its emissions tests. The agency also will be launching audits of every current make and model of light-duty diesel passenger vehicle, reflecting concern that cheating might be widespread.

The expanded checks will include on-road testing to better emulate real-world driving conditions. Some critics had previously alleged that the tests were outdated and easily outsmarted. The new audits will also include gasoline vehicles, an EPA official said

In this photo taken Feb. 14, 2013, a Volkswagen logo is seen on the grill of a Volkswagen on display in Pittsburgh. The Environmental Protection Agency (EPA) says nearly 500,000 Volkswagen and Audi diesel cars built in the past seven year are intentionally violating clean air standards by using software that evades EPA emissions standards.

RELATED

Volkswagen Sees Billions Erased From Market Value After Rigging Claims

The agency also confirmed that affected VW and Audi vehicles – diesel Passats, Jettas, Beetles, Golfs, and A3s, together numbering around 500,000 cars in the U.S. – would be recalled as the German auto group devises solutions to make the cars compliant with U.S. air standards.

"These violations are very serious," Janet McCabe, acting assistant administrator for the EPA's Office of Air and Radiation, said during a call with reporters. "VW was concealing the acts from EPA, from the state of California, and from consumers."

The California Air Resources Board tests vehicle emissions and was among the groups that uncovered the cheating regimen.

Volkswagen Group CEO Martin Winterkorn resigned Wednesday amid the continuing fallout from the scandal, stating he was "shocked by the events of the past few days" and "stunned that misconduct on such a scale was possible in the Volkswagen Group."

VW and Audi may ultimately face a penalty of up to $18 billion, or $37,500 per vehicle in violation. By comparison, Hyundai and Kia were penalized $300 million last year for overstating vehicles' fuel economy and greenhouse gas emissions.

The Justice Department has also reportedly opened a criminal investigation of Volkswagen AG.

EPA officials intimated that they expected VW and Audi penalties – as well as the expanded audits – to reflect the flagrancy of the violations. The cars, from model years 2009 through 2015, contained "defeat devices" buried in the software governing their engine controls. These lines of code automatically reduced emissions of nitrous oxide, or NOx, during tests, then switched off the restrictions during normal driving.

The cars were found to emit as much as 40 times the legal limit of NOx, the EPA said, which causes smog and a range of health problems. With 11 million of the vehicles on the road worldwide, one "back-of-the-napkin" calculation by Vox's Brad Plumer found they churned out as much as 20 times the NOx of a typical power plant, contributing to anywhere from dozens to hundreds of premature deaths.

"The facts before us show us that this firm sadly developed a very sophisticated scheme to defeat this test using software very deep in the engine control," Christopher Grundler, director of the EPA's Office of Transportation and Air Quality, said during Friday's call.

The EPA is partnering with the California Air Resources Board and bringing about Environment Canada – that nation's version of the EPA – to carry out its audits of gas and diesel vehicles. The agency said it would test cars from private owners who volunteer, as well as vehicles from rental companies. Officials declined to speculate how long the testing would take or how much it would cost the agency, but did acknowledge that expected recalls of VW and Audi vehicles would take longer for older models.

"We expect the first generation of vehicles, all pre-2015 vehicles except for the Passat, will require additional engineering … that will take longer," Grundler said.

VW's four-cylinder diesel vehicles for 2016 also have not yet received required emissions certification from the EPA because officials aren't yet certain the vehicles will perform as required.

The EPA's testing procedures date to 1975 and were most recently updated in the "early 2000s," Grundler said, when they were expanded to reflect aggressive driving, high-speed driving, and driving in hot and cold weather.

In light of the VW and Audi practices, he added, "we are going to be adopting some new approaches and new tests as a continuous improvement of our oversight."

CNBC:

http://www.cnbc.com/2015/09/25/epa-expect-range-of-penalties-for-vw-amid-scandal.html

EPA: Expect range of penalties for VW amid scandal

Fred Imbert

The Environmental Protection Agency said Friday it will be cracking down on Volkswagen after the German automaker admitted it added software on its vehicles to deceive emissions tests.

The EPA said it will hit the company with a range of penalties as a result of the investigation, but added that it has not issued a recall since the discovery.

"We are upping our game," Chris Grundler, head of transportation and air quality at the Environmental Protection Agency, told reporters in a teleconference.

The automaker, one of the largest car companies in the world, could face fines of $37,500 per vehicle in the U.S., the EPA said last week. With around 482,000 of its diesel vehicles sold in the U.S. since 2008, this could mean a penalty of up to $18 billion.

Rain clouds are seen over a Volkswagen symbol at the main entrance gate at Volkswagen production plant on September 23, 2015 in Wolfsburg, Germany. Volkswagen CEO Martin Winterkorn and other members of the supervisory board are believed to be meeting inside the headquarters to discuss the Volkswagen Diesel emission scandal, which affects 11 million vehicles worldwide.

Europe's carmakers caught up in VW storm

The agency also said it has already begun new testing of all diesel-powered vehicles, and is

planning even more new tests.

The EPA said it will improve its ability to detect so-called defeat devices or software that can reduce emissions during testing. But it will not tell automakers specifically how it is improving the testing.

"They don't need to know," Grundler said.

It added that the vehicles are safe to drive. Nevertheless, it also said these events make it clear it needs to improve its oversight over automakers and that Canada's Department of the Environment would be an active partner in testing vehicles more quickly.

Volkswagen German-listed shares have fallen nearly 30 percent in the last week, according to FactSet.

VW cheating scandal prompts EPA to widen testing of diesel cars

By JERRY HIRSCH

Working with regulators in California and Canada, the Environmental Protection Agency launched a new testing program Friday to look at the emissions from every make and model of diesel passenger cars on U.S. roads.

The increased oversight is a response to the discovery earlier this month that Volkswagen was using sophisticated software to cheat on pollution tests on 482,000 diesel vehicles sold in the U.S.

The automaker, which faces a federal criminal investigation and other regulator sanctions, admitted cheating and said the software could be on as many as 11 million vehicles worldwide.

"Clearly this is a concern for air quality and public health," said Janet McCabe, acting assistant administrator of the EPA office of air and radiation. "The Volkswagen violations before us now show that we must continue to improve our oversight."

Both the California Air Resources Board and the Environment Canada will join in the testing.

"This will allow us to move more quickly to test more models," said Christopher Grundler, director of the EPA's office of transportation and air quality.

The agency sent a letter Friday to all automakers explaining that their vehicles will undergo extra scrutiny.

The EPA said it now will test or require testing on any vehicle in a setting that emulates normal driving specifically for investigating the presence of a so-called defeat device, the industry term for systems that hide a vehicle's true emissions.

This will be in addition to the five standard emissions tests all new vehicles undergo and may require additional time, the agency said.

The agency and its partners also will use portable devices to measure the real life emissions of vehicles as they are driven on open roads, Grundler said.

Environmental groups welcome testing expansion and said it will deter other automakers from evading emissions regulations.

"EPA is on the job," said Luke Tonachel, director of clean vehicles and fuels project at the Natural Resources Defense Council. "This expansion of testing will is another signal that cheating will not be tolerated."

There is no evidence at this point to suggest that any other companies are cheating.

After tips from researchers in Europe and the University of West Virginia, California and federal regulators discovered that VW had buried an algorithm in 100 million lines of computer code in its vehicle electronics that allows the cars to emit up to 40 times the legally allowed amount of nitrogen oxide.

The cars met environmental regulations when tested on a dynamometer -- a kind of treadmill for vehicles -- in a laboratory. But they spewed pollution when driven on roads.

VW's software senses the testing environment by analyzing a variety of data -- steering position, speed, duration of engine operation, barometric pressure and changes in the car's performance.

The affected cars are the 2009 to 2015 Volkswagen Jetta TDI, 2009 to 2014 Volkswagen Jetta SportWagen TDI, 2012 to 2015 Volkswagen Beetle TDI, 2013 to 2015 Volkswagen Beetle Convertible TDI, 2010 to 2015 Audi A3 TDI, 2010 to 2015 Volkswagen Golf TDI, 2012 to 2015 Volkswagen Passat TDI, 2015 Volkswagen Golf SportWagen TDI.

Additionally, Volkswagen suspended new and used sales of the all 2.0-liter TDI four-cylinder diesel engines, including 2015 Beetle, Jetta, Golf, Passat TDI, as well as the Audi A3 TDI. Sales of VW's 2016, 4-cylinder diesel models are held up as they await EPA certification.

Grundler said the EPA is working with Volkswagen to evaluate potential remedies for the diesel vehicles' emission systems. The 2015 models will be the first fixed, followed by the 2012-15 Passats.

Because the range of cars affected include three generations of diesel engines, the remedies for the other vehicles could take much longer to develop.

Other automakers said they are ready for more rigorous testing of their diesel vehicles.

"We are prepared for testing," said Annalisa Bluhm, a GM spokeswoman. "We are not changing our diesel strategy as a result of what is going on with Volkswagen."

The automaker sells diesel pickup trucks and a diesel version of the Cruze sedan.

Bluhm said GM is "committed to the robust emissions compliance of all our vehicles" and expects its employees to know the regulations and "act legally and ethically."

Only about 3% of all autos and light truck sales involve diesel power trains.

According to the Diesel Technology Forum, there are 39 diesel-powered passenger vehicles being sold in the U.S. Those are made by Audi, BMW, Chevrolet, Jaguar, Jeep, Land Rover, Mercedes-Benz, Porsche, Ram and Volkswagen.

Get our weekly business news briefing >>

That number will grow, the forum said, by 15 more vehicles within the next year. Among the new entries will be light trucks from GMC, Chevrolet and Nissan.

Meanwhile, other German automakers issued statements saying that they have not gamed emission testing for their diesel offerings.

BMW said it observes "the legal requirements in each country.... Our exhaust treatment systems are active whether rolling on the test bench or driving on the road."

Mercedes-Benz said that it has never used defeat devices to evade testing, in response to allegations by a German environmental group that other automakers' diesels also exceed smog-forming nitrogen oxide emissions. The company said it sticks to all laws and rules and isn't aware of any measurements showing that its vehicles fail to keep to legal requirements.

Mercedes said it supports efforts to develop new testing methods to measure emissions based on real driving conditions.

-

The VW cheating scandal prompted the resignation of the automaker's chief executive, Martin Winterkorn. The company is expected to name a new CEO later Friday or in the coming days.

-

EPA warns other carmakers it will test for defeat devices

Chris Bryant in Frankfurt and Barney Jopson in Washington

The US environmental regulator put all vehicle manufacturers "on notice" on Friday that it will intensify its emissions testing on diesel-powered vehicles to discover whether "defeat devices" were being used more widely.

Janet McCabe, acting assistant administrator of the Environmental Protection Agency, told reporters: "We are stepping up our testing activities in response to VW's alleged violation."

The new testing regime will start immediately and Christopher Grundler, director of the EPA's office of transportation and air quality, said that for manufacturers it meant "we'll be keeping their vehicles a little bit longer and driving them more".

The EPA's announcement came as Volkswagen's board gathered to appoint a new chief executive to lead the carmaker, with Matthias Müller, head of Porsche, widely viewed as the favourite candidate.

The supervisory board meeting at VW's Wolfsburg headquarters follows Martin Winterkorn's resignation after eight years at the helm of the group.

Mr Müller is close to the Porsche and Piech families, who together control a majority of VW's voting shares, knows Volkswagen inside out and has a reputation for speaking his mind. The company declined to comment.

The board is also expected to decide on Friday which managers must leave the company over the scandal, with attention focusing on high-level engineers and designers.

VW has been reeling since the EPA revealed last Friday that the group had rigged its diesel cars to pass emissions tests, potentially laying itself open to criminal charges and substantial fines.

The EPA said that VW had installed defeat device software that turned off emissions controls during regular driving and turned them on during an emissions test. The software meant cars emitted up to 40 times the amount of nitrogen oxides that US environmental standards allow.

The EPA said 482,000 vehicles sold in the US since 2008 were affected, but VW later raised that figure to 11m worldwide. It said it would take a €6.5bn charge to cover the costs of the crisis.

A senior official at the EPA told the Financial Times that Volkswagen had orchestrated an unprecedented effort to beat the EPA's rigorous testing regime. "The level of deceit the company went through to game the system was enormous," the official said.

The EPA operated a cutting-edge testing regime to police compliance with clean air regulations, the official said, and it took an "elaborate, aggressive, ongoing, co-ordinated effort" to beat it. "We've seen uses of defeat devices, but nothing to this scale," the official added.

http://www.forbes.com/sites/neilwinton/2015/09/25/vw-struggles-to-agree-new-ceo-but-heres-some-advice-for-the-eventual-incumbent/

VW Struggles To Agree New CEO, But Here's Some Advice For The Eventual Incumbent

Neil Winton ,CONTRIBUTOR

A meeting in Wolfsburg, Germany, of Volkswagen executives to appoint a new CEO was dragging on into the evening, suggesting a lack of agreement on who should replace Martin Winterkon.

Winterkorn resigned this week in the wake of the scandal in which VW duped the EPA with false diesel data. VW's shares dived on stock markets, and the company's 20-member

supervisory board is apparently torn between appointing the media favourite Porsche CEO Matthias Mueller or VW brand chief Herbert Diess to replace Winterkorn.

Max Warburton, analyst with Bernstein Research, said Diess was his first choice.

"He's the best candidate if VW wants to show everyone – internally and externally – that the regime has changed," Warburton said.

Diess was recently hired from BMW so is not tainted by any of the VW scandals.VWLogo.jpg

"Diess would also be the best choice for shareholders who would like other changes after the EPA scandal has been dealt with. Our second vote goes to Hans Dieter Poetsch. He would be a good option in the short-term as VW needs an eloquent, unflappable face to put in front of U.S. Congress and media," Warburton said.

Poetsch, currently VW's finance chief, was nominated earlier this month as the replacement for Ferdinand Piech as Chairman of the board. Poetsch faces a shareholder vote in November to confirm his appointment.

Whoever gets the new CEO job should do the following, Warburton said.

Offer to buy back and scrap every 2.0 diesel sold in the U.S. – all 482,000 of them – cost $6 billion.

Announce that VW will henceforth abandon all efforts to sell diesel engines in the U.S., but will embrace gasoline and plug-in hybrids.

Send the new CEO to the U.S. Monday to meet government officials, the EPA and media.

Announce the immediate suspension of the 100 engineers most closely linked with the engine and software development.

Announce the cessation of all motorsport activities immediately, turning all the funding over the electric, plug-in hybrid and environmental research in a new research facility located in the U.S. employing U.S engineers.

EPA to automakers: We'll test everyone for VW problems

By Chris Isidore and Ahiza Garcia @CNNMoney

Federal regulators are putting U.S. automakers on notice.

The EPA said Friday it will test emissions at every automaker to make sure no other company is trying to dodge pollution regulations like Volkswagen did.

The agency will send a letter to all manufacturers to notify them that it's stepping up its emissions policing.

The EPA said it will test every model of diesel car, SUV and pickup that's now on the road in the U.S. The testing won't include large vehicles such as semi-tractors and buses, which also use diesel.

It added that the new testing procedures will be more vigorous to prevent automakers from cheating, and will more closely approximate the emissions from a vehicle in real-world driving conditions.

Last week, the EPA found that Volkswagen had falsified pollution tests on 482,000 VW and Audi diesel cars in the U.S.

Those models include the VW Jetta, the Passat from 2014-2015, the Beetle and the Golf from 2009 through 2015, and the Audi A3, model years 2009-2015. Audi is owned by Volkswagen (VLKAY) Group.

Volkswagen manipulated software so its cars would seem cleaner when they were being tested. But when they were on the road, the cars pumped out nearly 40 times the legal level of nitrogen oxide. Volkswagen has since admitted it cheated.

EPA officials insisted on a call with reporters Friday that the previous testing procedures were sophisticated and sufficient to accurately detect the emissions from the diesel cars as long as a manufacturer is not deliberating trying to cheat the process.

Since the EPA plans to test older cars that are no longer available from the manufacturers, the agency said it will borrow cars from individuals as well as businesses, such are rental car companies, which own the vehicles it wants to test.

Volkswagen's directors are meeting Friday to name a new CEO after Martin Winterkorn stepped down earlier this week.

Winterkorn said he was unaware of the emissions cheating and apologized for the possible data manipulation in roughly 11 million cars worldwide.

VW has had to set aside €6.5 billion ($7.3 billion) to deal with the issue, but the final total could far exceed that. The automaker is also facing criminal probes from U.S. state attorneys generals and possibly the federal government. The EPA could impose a civil penalty of $37,500 per violation, which would come to $18 billion.

Volkswagen's share price has plunged 50% in the wake of the scandal.

EPA to Begin Retesting All Light Diesel Cars on the Road for Defeat Devices

BY ZOË SCHLANGER

The search for more "defeat devices" installed in cars and meant to cheat emissions tests has begun. The U.S. Environmental Protection Agency announced on Friday it would begin systematically re-testing all models of light diesel vehicles currently on the road in the U.S. The goal is to weed out any other potential defeat devices following the discovery that Volkswagen designed and installed software in their cars that for years tricked the EPA's testing system.

"Today we are putting vehicle manufacturers on notice" that there will be additional testing to look for defeat devices, Christopher Grundler, director of EPA's Office of Transportation & Air Quality, said on a call with reporters Friday. "We aren't going to tell them what these tests are, they don't need to know. They only need to know we will be keeping their cars a little bit longer, and driving them a little bit more."

EPA maintains that it has the necessary expertise and equipment to detect defeat devices. However, the regulator did not catch Volkswagen's alleged fraud on the U.S. portion of the 11 million cars globally that contained the defeat device. The cars range from model years 2009 to 2015. According to EPA, the cars 'knew' when they were being tested for emissions, and were

able to temporarily present much lower emissions than they did while on the road.

"As you know, the company, very deeply, within 100 million lines of software code, had a very specific algorithm to defeat the test," Grundler said. "They developed a very sophisticated scheme to defeat the test. It was a deliberate attempt to have two calibrations on the vehicle."

Each VW car was able to emit up to 40 times the allowed amount of NOx. EPA still has not calculated the additional amount of NOx the cars contributed to the atmosphere, but Janet McCabe, EPA's acting assistant director, said the agency "need[s] to address this." One estimate puts the number at between 250,000 to 1 million extra metric tons of NOx pollution per year, according to The Guardian.

NOx emissions have been found to contribute to respiratory illness and heart disease as well as early death.

Volkswagen Deception Spurs EPA To Start "Defeat Device" Tests Of All Cars

The Environmental Protection Agency will start auditing all cars for "defeat devices" designed to cheat on emissions tests. The decision was spurred by Volkswagen diesel cars violating clean air laws in this fashion.

Dan Vergano

The U.S. Environmental Protection Agency told all major auto companies on Friday that it would now audit cars for emissions test "defeat devices," following revelations that Volkswagen diesel cars cheated on pollution standards.

The environmental agency announced last week that software in Volkswagen diesel cars – perhaps 11 million vehicles worldwide – was designed to turn off exhaust cleaning controls in engines except when the vehicle underwent emissions tests. With the controls off, the vehicle's exhaust contained up to 40 times more pollutants than allowed by law.

"Today we are putting vehicle makers on notice," EPA's Christopher Grundler said during a news conference. Unlike past emissions test, the details of how the agency, along with Canada's environmental agency, will test vehicles for emissions cheating would not be provided to car makers, he said. That will prevent them from writing software allowing cars to recognize when they are being tested and turn on emissions controls.

In the past, the agency had focused on heavy diesel trucks for such tests because of their significant emissions and history of defeat devices, Grundler said. But now all cars will face added inspection for emissions cheating.

Volkswagen's chief, Martin Winterkorn, resigned in light of the revelations on Wednesday. And claims that BMW cars might have similar emissions questions affected the company's stock on Thursday, leading to a 9.7% drop.

The nonprofit International Council on Clean Transportation (ICCT), which had helped alert EPA to the Volkswagen emissions cheating, said in a statement last week that "defeat devices" are a worldwide problem in cars. European studies, "repeatedly found large and growing gaps between real world emissions and the regulatory certification levels."

"This is a global problem that will require a coordinated global solution," said ICCT's Drew Kodjak.

E.P.A. to Bolster Testing Because of Volkswagen Scandal

By THE NEW YORK TIMES SEPT. 25, 2015

Government regulators said Friday that they planned to step up the testing requirements of cars in the wake of the Volkswagen scandal.

The Environmental Protection Agency, which disclosed last week that it had learned that Volkswagen diesel cars had equipment to evade smog-testing standards, said it had sent a letter to manufacturers of gasoline and diesel cars saying that regulators would be looking for so-called defeat devices in all vehicles.

The agency said Volkswagen had used a device programmed to fool emissions testers into thinking that the car was emitting much less pollution than it was during regular driving.

"Manufacturers should expect that this additional testing may add time to the confirmatory test process," the E.P.A. wrote in its brief letter. The agency said that the new procedures would start immediately and that the California Environmental Protection Agency and Canada's environmental regulators were involved with the stricter requirements.

"We are not going to tell them what these tests are, and they don't need to know," Chris Grundler, director of the agency's office of transportation and air quality, said during a conference call with reporters.

U.S. EPA Toughens Emissions Oversight After VW Cheating

Jeff Plungis

September 25, 2015 — 8:42 AM EDT Updated on September 25, 2015 — 10:41 AM EDT

U.S. environmental regulators will add more spot-checks to cars already on the road following Volkswagen AG's admission that it fitted as many as 11 million diesel cars worldwide with software that rigged pollution tests.

"We are upping our game," said Christopher Grundler, director of the Environmental Protection Agency's Office of Transportation and Air Quality.

The U.S. Justice Department is conducting a criminal investigation of Volkswagen, and the company said it's cooperating with regulators. The admission has marred the reputation of the world's largest automaker and sent its shares to the lowest levels in years. Volkswagen's board is expected to name a successor Friday to former Chief Executive Officer Martin Winterkorn, who resigned this week.

The EPA is sending a letter Friday to automakers informing them that emissions monitoring is being enhanced. Grundler wouldn't say what changes the agency will make to the testing.

"They don't need to know," Grundler, speaking to reporters on a conference call, said of the automakers. "They need to know that we will be keeping their cars a little bit longer."

Grundler earlier told the Associated Press that the agency may add on-road testing. It already has on-road testing ability but it's only been used to check carmaker gas mileage estimates and diesel trucks, two situations in which they had uncovered emissions cheating in the past.

Past Cheating

The scandal now engulfing VW, which has admitted to outfitting cars with software designed to give false readings on emission tests, is unique both for the number of vehicles involved, and the digital complexity. But it's not the first emissions-cheating case, even for the Wolfsburg, Germany-based company.

In 1973, the EPA accused the automaker of installing defeat devices in cars it wanted to sell in the 1974 model year. VW then admitted it had sold 1973 model year cars with the devices, which consisted of temperature-sensing switches that cut out pollution controls at low temperatures.

General Motors Co. agreed in 1995 to pay $45 million after being accused of circumventing pollution controls on 470,000 Cadillac luxury sedans. The cars' 4.9-liter V-8 engines were tuned to turn off pollution controls when the air conditioning ran, the EPA said at the time.

The current VW case resembles a 1998 case involving seven manufacturers of heavy-duty truck engines: Caterpillar Inc., Cummins Inc., Detroit Diesel Corp., Mack Trucks Inc., Navistar International Transportation Corp., Renault Vehicules Industriels, S.A. and Volvo Truck Corp.

The companies agreed to spend more than $1 billion, including $83.4 million in penalties, to settle the case -- the biggest civil fine to that point for violating an environmental law.

EPA steps up emissions testing after Volkswagen scandal

By Timothy Cama - 09/25/15 11:22 AM EDT

The Environmental Protection Agency (EPA) is stepping up its emissions testing for diesel cars in an attempt to root out companies that cheat the tests.

The agency, working with officials in California's air pollution agency and Canada, plans to test every model of diesel car on the road to see if other automakers programmed their cars to skirt the tests like Volkswagen Group did.

"We're putting vehicle manufacturers on notice that our testing is now going to include additional evaluation and tests designed to look for potential defeat devices," Chris Grundler, director of the EPA's transportation office, told reporters Friday.

"We aren't going to tell them what these tests are. They don't need to know," he said. "They only need to know we will be keeping their vehicles a little bit longer and we're going to be driving them a little bit more."

The new procedure comes a week after the EPA announced that Volkswagen had programmed many of its diesel cars sold since 2009 to figure out when they were undergoing EPA tests and change their pollution output to comply with the tests.

In real-world driving, the cars emit up to 40 times more nitrogen oxides than allowed under the Clean Air Act.

Officials with the different agencies hope that their tests can find any emissions problems that were not revealed in the testing that all new cars undergo, which is very standardized and does not usually involve on-road driving.

"We must continue to improve and adapt our oversight, and we will," said Janet McCabe, acting head of the EPA's air pollution office.

The emissions issue, to which Volkswagen has admitted, has quickly evolved into an international scandal, with government officials in Europe, Germany, the United Kingdom, France and elsewhere taking action.

Domestically, the Justice Department is conducting a criminal investigation, and a House committee will soon hold a hearing on the scandal.

Volkswagen's chief executive officer resigned this week, and the head of its United States operations is expected to resign as well.

The EPA initially identified less than 500,000 cars with Volkswagen and Audi branding affected. But the company later said the problem extended to 11 million cars worldwide, although the issue only applies to United States emissions standards.

The EPA has 23 devices for testing on-road driving emissions, but Grundler said those have usually been dedicated to heavy-duty truck use.

Grundler and McCabe repeatedly declined to outline the new test procedures, saying they do not want automakers to try to defeat them.

"The smart engineers at EPA, California Air Resources Board and Environment Canada have come up with clever ways to do this," Grundler said.

The announcement does not change the standard testing that applies to new vehicles. Instead, the EPA is using its authority to test cars currently in operation, including those from rental car fleets and individual consumers.

The new tests started Friday, Grundler said, declining to say how long it would take to test all diesel car models.

EPA to change diesel tests to thwart Volkswagen-like cheating

By Tom Krisher and Matthew Daly - Associated Press - Friday, September 25, 2015

DETROIT (AP) — The U.S. Environmental Protection Agency plans sweeping changes to the way it tests for diesel emissions after getting duped by clandestine software in Volkswagen cars for seven years.

Chris Grundler, head of the EPA's office of transportation and air quality, indicated the agency would add on-road testing to its regimen. VW's sophisticated software allowed its cars to pass tests in the lab and then spew pollution into the atmosphere while on the highway.

The revelations meant unwanted scrutiny for the EPA. Its testing procedures have been criticized for being predictable and outdated, making it relatively easy for VW to cheat. What's more, the EPA did not initially uncover the problem; researchers at West Virginia University did, using on-road testing.

Grundler says the changes are designed to detect software and other methods automakers might use to rig a test.

The EPA and the California Air Resources Board have engineers who are "developing clever ways in which these things can be detected," Grundler says.

He also notes that testing of diesel engines, which make up only 1 percent of the vehicles on U.S. roads, wasn't the top priority for the EPA. The agency did have on-road testing equipment — but it was assigned to monitor automaker gas mileage estimates and heavy-duty diesel trucks, where cheating had been uncovered in the past.

Grundler, who has been with the EPA for more than three decades, says the lack of on-road testing for diesels "might change in the future." An announcement of the changes could come on Friday.

VW has admitted to installing software on Volkswagen and Audi cars with four-cylinder diesel engines that switches on pollution controls when they are being tested. When the software, called a "defeat device," determines that the cars are back on real roads, the controls are turned off. The EPA says about 500,000 U.S. cars including the Jetta, Golf, Beetle, Passat and Audi A3 have the cheating software, and VW says a total of 11 million cars have it worldwide.

VW was able to fool the EPA because the agency only tested the cars on treadmill-like devices called dynamometers and didn't use portable test equipment on real roads. The software in the cars' engine-control computers checked the speed, steering wheel position, air pressure and other factors to determine when dynamometer tests were under way. It then turned on pollution controls that reduced the output of nitrogen oxide, an ingredient in harmful ozone, the EPA has said.

VW started the scheme with the 2009 model year, and may not have been caught without testing performed at West Virginia University on behalf of the International Council on Clean Transportation, a nonprofit group that advises governments on regulations. EPA and California regulators confronted VW with those findings to VW in May 2014. The automaker eventually did a recall late last year, without much improvement, the EPA says.

Only when the EPA and CARB refused to approve VW's 2016 diesel models for sale did the company admit what it had done.

The EPA announced the violations a week ago and said VW could face billions in fines. The agency said the cars are safe to drive but VW will have to pay to recall and fix them. The agency also is going to test diesels from other manufacturers to make sure they don't have similar devices.

Sen. Bill Nelson of Florida is frustrated that regulatory agencies such as the EPA are failing to protect the public. "Seven years is way too long a time that the EPA has been asleep at the switch," he says.

He says the VW case has similarities to those involving General Motors ' defective ignition switches and Takata Corp.'s exploding air bag inflators, where it also took years before those problems were disclosed to consumers.

"When there is this kind of deception, we've got to get these agencies to be able to cut through it and catch it," Nelson says.

It's not the first time the EPA has had to change testing to make sure automakers are playing by the rules. Earlier this year the agency updated gas mileage tests after some automakers were caught with inflated window sticker estimates.

Grundler disputes the notion that EPA would never have caught VW without the outside help. European regulators were looking into VW's on-road diesel emissions as far back as 2012, and since diesels make up half the cars there, the EPA decided to let Europe take the lead, he says.

"I don't think it's fair to say that this would never have been uncovered," he says. "Do I wish we had uncovered it sooner? Absolutely."

USA Today:

EPA to road-test cars after Volkswagen emissions scandal

Nathan Bomey, USA TODAY 10:40 a.m. EDT September 25, 2015

The change comes after Volkswagen fooled regulators into believing that its 4-cylinder diesel cars were compliant with emissions rules.

The Environmental Protection Agency told automakers on Friday that it will begin road tests of all new and used vehicle models to examine emissions claims following the exposure of Volkswagen's regulation cheating scandal.

The agency sent a letter to manufacturers notifying them that it will no longer rely exclusively on laboratory testing to validate emissions performance.

EPA also plans to begin testing all diesel models already on the road in the U.S. to check for similar violations.

"EPA may test or require testing on any vehicle at a designated location, using driving cycles and conditions that may reasonably be expected to be encountered in normal operation and use, for the purposes of investigating a potential defeat device," EPA told automakers in the letter.

The agency warned that the new process could mean it will take longer for automakers to secure certification required to sell new vehicles in the U.S.

"We aren't going to tell them what these tests are," said Christopher Grundler, director of the EPA Office of Transportation and Air Quality, in a conference call with reporters. "They don't need to know."

The change comes after Volkswagen fooled regulators into believing that its 4-cylinder diesel cars were compliant with emissions rules by installing sophisticated software to manipulate lab

tests.

In reality, 11 million Volkswagen cars worldwide are emitting nitrogen oxides — which can exacerbate respiratory conditions such as asthma — at rates of up to 40 times acceptable U.S. standards.

The scandal has severely damaged Volkswagen's reputation, led to the resignation of the automaker's CEO and called into question the future of diesel cars. Several criminal investigations and numerous lawsuits have also followed.

The automaker set aside more than $7 billion to pay for fixes and fines. The episode is expected to trigger a massive recall.

The Volkswagen scandal has sparked a huge change in car emissions testing

by Benjamin Snyder @WriterSnyder SEPTEMBER 25, 2015, 10:39 AM EDT

Critics have wanted this move for years.

The U.S. Environmental Protection Agency will being testing vehicles' ability to meet emissions standards under real-world driving situations, it announced Friday. The agency formerly conducted random testing of vehicles in a way that critics have argued failed to simulate actual driving.

The change comes less than a week after German automaker Volkswagen admitted that 11 million of its diesel vehicles worldwide were loaded with software designed to trick the emissions testing process. About half a million of those vehicles were sold in the U.S.

EPA may test or require testing on any vehicle at a designated location, using driving cycles and conditions that may reasonably be expected to be encountered in normal operation and use, for the purposes of investigating a potential defeat device," reads a letter the EPA sent to automakers Friday, using an industry term for the illicit software found on Volkswagen's cars.

EPA officials said on a call with reporters Friday that the agency is "actively" testing diesel cars to ensure they meet emissions standards following the Volkswagen's revelations. Environmental agencies in the State of California and Canada are spearheading efforts to ensure there's a "broader and more robust presence" of testing, officials added.

The EPA also said it's working with Volkswagen to determine how to modify the affected vehicles already sold in the American market.

Volkswagen's stock price has tanked amid the scandal, which forced Volkswagen AG CEO Martin Winterkorn to resign Wednesday.

EPA to Overhaul Air-Emissions Testing in Wake of Volkswagen Cheating Revelation

By AMY HARDER

Sept. 25, 2015 9:31 a.m. ET

WASHINGTON—The U.S. Environmental Protection Agency is overhauling the way it polices auto-maker compliance with air-emissions standards after Volkswagen cheated on its testing for seven years, an agency official said Friday.

The EPA is sending a letter to auto manufacturers to explain that it may test or require testing of vehicles in an environment that would resemble normal driving conditions, the official said.

The EPA's current protocol doesn't test under real-word driving conditions, and requires auto makers instead to submit design certificates for compliance. The EPA has conducted random testing, but those are done in a controlled environment. Volkswagen had installed software designed to evade those tests.

Since at least 2008, Volkswagen has been using software, dubbed defeat devices, in several light-duty diesel models around the world—nearly a half-million cars in the U.S. and as many as 11 million world-wide—that disabled air-emissions controls under normal driving conditions.

The EPA's announcement Friday caps a tumultuous week for Volkswagen, whose CEO resigned following the revelations, and for the U.S. government, which scrambled to respond to the German auto maker's cheating.

The Justice Department is pursuing a criminal investigation.

"We have to be concerned about whether or not there are other defeat devices out there that we have not been able to detect," EPA Administrator Gina McCarthy said at an event hosted by The Wall Street Journal this week. "This was particularly difficult for us to detect. We got there."

It wasn't immediately clear Friday how comprehensive the new testing in normal driving conditions would be. Some experts have been calling on the agency to conduct such testing.

"The most important change that could take place is if EPA started incorporating real-world testing throughout their compliance process," said Drew Kodjak, executive director of the International Council on Clean Transportation, a nonprofit research organization. The organization, alongside West Virginia University researchers, uncovered the testing anomalies in two Volkswagen model cars in 2014.

"The agency certainly has the authority to do this type of thing, but typically doesn't do them because, frankly, they're quite expensive," Mr. Kodjak said on Thursday.

In 2014, Mr. Kodjak's group and the university researchers conducted emissions testing, including under normal-driving conditions, that found two Volkswagen cars—a 2012 Jetta and 2013 Passat—had significantly higher nitrogen oxide emissions during normal driving conditions than what was certified with the EPA. Another car the researchers tested, a diesel-powered BMW, didn't have higher nitrogen oxide emissions.

EPA to change diesel tests to prevent VW-like cheating

by Chris Matthews @crobmatthews SEPTEMBER 25, 2015, 7:50 AM EDT

Diesel 'wasn't the top priority for the EPA.'

The U.S. Environmental Protection Agency is planning wholesale reform of its procedure for testing diesel engines, following revelations that Volkswagen VLKPY -5.72% installed software in its cars that allowed it to fool regulators into thinking the vehicles were cleaner than they actually were, according to the Associated Press.

Chris Grundler, head of the EPA's office of transportation and air quality, told the news service that his agency would begin testing cars on the road in addition to the tests performed with cars on treadmills.

Grundler told the AP that cars with diesel engines, which make up only 1% of the vehicles on U.S. roads, "wasn't the top priority for the EPA."

"The agency did have on-road testing equipment — but it was assigned to monitor automaker gas mileage estimates and heavy-duty diesel trucks, where cheating had been uncovered in the past," the report said.

The EPA's testing procedures have been criticized for being predictable and outdated, the AP said, potentially making it easier forVW to cheat. And it was researchers at West Virginia University—not the EPA—that uncovered the problem using on-road testing, the AP added. An announcement of the changes could come on Friday.

Financial Times:

http://www.ft.com/intl/cms/s/0/d4feb2e2-628e-11e5-9846-de406ccb37f2.html#axzz3mgG3bZd2

Volkswagen board gathers to appoint replacement for Winterkorn

Chris Bryant in Frankfurt and Barney Jopson in Washington

Volkswagen's board are gathering to appoint a new chief executive to lead the troubled carmaker

out of the worst scandal in its history, with Matthias Müller, head of Porsche, as the favourite candidate.

The supervisory board meeting at VW's Wolfsburg headquarters — which may take several hours — follows Martin Winterkorn's resignation after eight years at the helm of the group.

People close to VW indicated that Mr Müller is the frontrunner in the succession race.

He is close to the Porsche and Piech families, who together control a majority of VW's voting shares, knows Volkswagen inside out and has a reputation for speaking his mind. The company declined to comment.

The board is also expected to decide on Friday which managers must leave the company over the scandal, with attention focusing on high-level engineers and designers.

VW has been reeling since the US Environmental Protection Agency revealed last Friday that the group had rigged its diesel cars to pass emissions tests, potentially laying itself open to criminal charges and substantial fines.

The EPA said that VW had installed "defeat device" software that activated technology designed to reduce emissions from the vehicles only when it detected that they were being tested. The emissions then returned to much higher levels during regular driving.

The EPA said 482,000 vehicles sold in the US since 2008 were affected, but VW later raised that figure to 11m worldwide. It said it would take a €6.5bn charge to cover the costs of the crisis.

A senior official at the EPA told the Financial Times that Volkswagen had orchestrated an unprecedented effort to beat the EPA's rigorous testing regime. "The level of deceit the company went through to game the system was enormous," the official said.

The EPA operated a cutting-edge testing regime to police compliance with clean air regulations, the official said, and it took an "elaborate, aggressive, ongoing, co-ordinated effort" to beat it.

"We've seen uses of defeat devices, but nothing to this scale," the official said.

INSIGHT-After year of stonewalling, VW stunned US regulators with confession

WASHINGTON/DETROIT SEPT 24 | BY TIMOTHY GARDNER, PAUL LIENERT AND DAVID MORGAN

The confession of cheating that's embroiled Volkswagen AG in one of the biggest scandals in auto industry history came on a cool California morning, on the sidelines of an academic conference focused on green transportation.

After more than a year of stonewalling investigators, Volkswagen stunned two senior officials with the U.S. Environmental Protective Agency and California's environmental watchdog by admitting the automaker hacked its own cars to deceive U.S. regulators about how much their diesel engines pollute.

That disclosure on Aug. 21, confirmed by two people with knowledge of the exchange, shows Volkswagen buckled to pressure from environmental regulators almost a month earlier than the scandal was made public. The admission to regulators came after a year during which VW officials insisted to regulators that tests on its diesel cars showing a spike in pollution levels on

the road were in error.

U.S. officials exposed the deception on Sept. 18, triggering Volkswagen's admission that it had installed software in its cars to detect when they were being tested and alter settings to conceal the true emissions of 11 million cars sold worldwide. The delay between VW's confession and the U.S. exposure of the scandal occurred as regulators prepared their response to the disclosure.

As a result, Volkswagen, the world's largest automaker by sales, faces EPA fines that could reach $18 billion, class action and other lawsuits that could add billions of dollars more in liability and a U.S. criminal investigation. VW's leadership is in turmoil after chairman Martin Winterkorn was forced to resign and sources said other executives including the head of U.S operations were soon to follow.

Now, the story of how investigators unraveled systemic cheating in the face of consistent denials from the company may have implications for the sanctions VW will face and for an auto industry certain to face more scrutiny about its environmental claims. The company's lack of cooperation could figure into punitive action by the government.

At first, regulators were surprised that Volkswagen would make its confession at the conference, held in Pacific Grove, California. Minutes before Christopher Grundler, director of the EPA's transportation and air quality office, was to deliver a 9 a.m. speech to the conference, a Volkswagen representative told him about the deception. At the same meeting, representatives of the California Air Resources Board, a state agency that had been pushing VW hard, were also given a verbal notice of the deception, people with knowledge of the events said.

Volkswagen declined to comment on the sequence of events described to Reuters. It isn't clear who the VW representative was who delivered the news of the deception to Grundler and the CARB. Stuart Johnson, head of VW's engineering and environmental office in the United States, was registered to attend the Aug. 21 conference, which was organized by the University of California, Davis. Johnson, who still works for VW in Auburn Hills, Michigan, did not respond immediately to a request for comment.

Norbert Krause, who was head of VW's U.S. environmental office until 2009 and who retired from VW in 2011, said nobody at Volkswagen of America was involved in the process of

engineering the diesel cars.

"I don't know anything about the modification of the software," Krause said when reached by telephone in Germany. "The software was okay when we certified the vehicle and we made our durability runs. Everything was fine."

DECEPTION ACKNOWLEDGED

A formal acknowledgement of the deception came on Sept. 3, when the EPA and California officials held a conference call with Volkswagen executives in Germany and the U.S. During the call, the automaker went over written details provided to the participants explaining how software used in its diesel cars was able to manipulate emissions tests in the United States.

That admission came after the EPA threatened to withhold approval for the company's 2016 Volkswagen and Audi diesel models, according to a letter sent by the EPA to Johnson and VW's attorney. The letter detailed some of the timetable of the EPA's actions.

So ended 15 months of back-and-forth between Volkswagen and U.S. and California regulators who had come to suspect that the diesel engines were producing higher nitrogen oxide emissions during normal driving conditions than what was certified by the EPA and California, people involved said. Nitrogen oxide emissions have been linked to smog and acid rain.

Volkswagen had heavily marketed what it called "clean diesel" engines starting in 2008 with the 2009-model Jetta TDI. It appeared to have found a sweet spot between high-performance and fuel-efficiency with a zippy, fun-to-drive car that topped 40 miles per gallon in highway driving. Named "Green Car of the Year" at the Los Angeles auto show in 2008, the Jetta TDI was seen as a breakthrough in a country where diesel passenger cars occupy a tiny niche compared with Europe, where they are about half of the market.

GRANDFATHER'S DIESEL

"It's not your grandfather's diesel," Krause said in a September 2008 presentation to U.S. regulators, according to a video of the remarks.

Krause and other VW officials promised a diesel that would meet pollution laws in all states, including California where diesel engines had long been associated with smog and cancer-causing soot.

By that point, VW and other automakers had lobbied for almost a decade for regulators to give diesel another chance. In 2000, VW and other companies with an interest in promoting diesel, including Mazda, formed the Diesel Technology Forum to lobby for increased use in the United States as a way to reduce reliance on imported oil. In 2005, an energy bill signed by President George W. Bush offered tax credits for diesel buyers. That gave the first wave of diesel Jetta buyers an income tax credit of $1,300 each.

In 2009, after the new Jetta went on sale, VW dealers initially sold out, including in California where regulations had effectively shut the market to diesels earlier in the decade.

Around the same time, in Europe, regulators were skeptical. A European Commission study concluded in 2013 that European car makers were exploiting test loopholes. Separate findings by the EC's Joint Research Centre showed a discrepancy between test results and real world performance in European diesel engines.

California began its inquiry after EC regulators sought to obtain American data on the on-road emissions performance of diesel engines, said Stanley Young, CARB's communications director. The Europeans had a working theory that diesels should run more cleanly in the United States, where regulations are stricter, than in Europe.

To produce that data, they commissioned the U.S.-based nonprofit International Council on Clean Transportation in February 2013, which hired researchers at a West Virginia University lab.

The WVU researchers placed emission-monitoring equipment on a rented 2012 Jetta and a 2013 Passat. Over seven weeks in spring 2013, they drove the cars around Los Angeles and up the West Coast to Seattle, comparing them to a BMW X5 sport-utility with a diesel engine, said Daniel Carder, who led the WVU team. While the BMW's emission results came in under what the vehicles produced in laboratory tests, those of the Jetta were 15 to 35 times higher than the legal limit and the Passat 10 to 20 times higher.

Soon after, the same rental cars tested by WVU were monitored in CARB's El Monte, California, test facility east of Los Angeles. There were no irregular emissions.

Over the next 12 months, the West Virginia University researchers analyzed the data. They presented their findings at a March 31, 2014, conference in San Diego partly sponsored by California regulators and the EPA.

EXECUTIVES ON ALERT

"That data put our executives on alert that there was clearly a problem for the U.S. and California," said Young, the CARB official.

At meetings between California officials and Volkswagen that began in the summer of 2014, engineers from the German carmaker tried to "discredit the findings" by challenging the data and methodology of the study, Young said. "They were recalcitrant," he said. "It was a range of issues. Every time it was something different."

Among other things, VW said that "our calibration was off" and that the discrepancies had to do with "the conditions under which the test was done," Young said.

On Dec. 2, Volkswagen shared the results of its own tests, blaming its increased emissions on "various technical issues and unexpected in-use conditions," according to the EPA. Then Volkswagen agreed to recall vehicles to fix their engine-control software.

Engineers at CARB kept testing and found the proposed software fix did not significantly reduce emissions. A break came when they looked at diagnostic data stored in the cars' own computer system.

"We discovered some very strange anomalies," Young said. "For instance, the car was running more cleanly when it was cold than when it was warm, which is the opposite of what every other car does - because once you warm a car up that's when it begins to deliver its best pollution controls. This was not the case. So clearly something else was going on. Over time we assembled enough proof and questions that they could no longer provide any reasonable explanation for what was going on."

On July 8, CARB shared its results with VW, but there was no change in Volkswagen's position. Some officials privately questioned whether Volkswagen was deliberately violating the federal Clean Air Act by installing defeat devices -- software programmed to switch engines to a cleaner mode during official emissions testing, according to a person involved in the process.

During normal driving, the software then shuts off, enabling cars to emit as much as 40 times the legal limit of pollutants.

In early August, Oliver Schmidt, who followed Krause and preceded Johnson in VW's U.S. engineering and environmental office, attended a conference in Traverse City, Michigan and told regulators Volkswagen stood by its conclusions that the problem was technical, said people involved said. Schmidt declined to speak to Reuters.

"I'm just amazed," said Alan Lloyd, who headed CARB from 1999 to 2004 and helped open California's market to diesels. "Why someone would think they could cheat in this way and get away with it is beyond me."

Will Volkswagen Scandal Tarnish 'Made in Germany' Image?

By DAVID RISING, ASSOCIATED PRESS

BERLIN — Sep 24, 2015, 4:54 PM ET

The "Made in Germany" label has stood for precision and reliability for decades, but since Volkswagen admitted to cheating on U.S. car emissions tests, many are questioning whether the automaker's problems could taint the rest of the country.

It's the second serious blow to a major German company's reputation in six months, following the tragic crash of a Germanwings jet that killed 150 people. Parent company Lufthansa has faced questions over why it failed to identify the psychological issues suffered by the pilot who intentionally flew the plane into a French mountain.

Will such crises tarnish the hard-won, valuable reputations for quality of other German brands, such as BMW, Daimler or Bosch?

Experts say VW's problems could hurt the economy in the short term due to the company's sheer size, but that long-term damage to the country is unlikely.

That doesn't mean others won't try to capitalize. Companies will try to grab market share. And across Europe, people in countries that have been lectured by Germany for years about the virtues of financial honesty could be feeling smug.

"Not only does this make Germany look bad, I think that Germany has been very good at moralizing to the rest of Europe about the financial crisis and other things," said Michael Hewson, chief market analyst for CMC Markets in London.

"Germans have a word for it — 'schadenfreude' — and Germany's getting a big dose of it now," he said, referring to the German word for taking pleasure at the misfortune of others.

Indeed, Internet memes of VWs covered in clouds of smog were already making the rounds, and media commentators were quick to pounce on the issue.

"In Europe, there is a strong dose of schadenfreude ... after the Germans, and primarily Chancellor Angela Merkel, have for years been giving lectures others," wrote Thilo Schaefer for Spain's La Marea news magazine.

Still, in Lufthansa's case, the airline has not appeared to suffer any serious damage following the March crash.

Volkswagen's case could prove more costly for the company, though by how much is still unclear. CEO Martin Winterkorn resigned Wednesday and the company is expected to name a replacement Friday.

The EPA accused VW of installing the so-called "defeat device" in 482,000 cars sold in the U.S. VW later acknowledged that similar software exists in 11 million diesel cars worldwide and set aside 6.5 billion euros ($7.3 billion) to cover the costs of the scandal.

It still faces possible criminal investigations and maybe as much as $18 billion in U.S. fines. The final cost could also depend on a host of class action lawsuits being filed by consumers who feel duped.

This is by no means the first time in recent years that a major German company's reputation for probity has taken a huge knock — though perhaps the first time that the damage has stemmed directly from a product that was popular with consumers.

Volkswagen itself was at the center of an unappetizing scandal less than a decade ago — before Winterkorn took over — that resulted in criminal convictions for the company's then-personnel chief and employee council chief, among others. That case centered on allegations that VW's influential employee representatives received illegal privileges, including lavish foreign trips involving prostitutes paid for by the company. The probe started after Volkswagen alerted prosecutors to possible wrongdoing.

Industrial conglomerate Siemens AG acknowledged dubious payments of up to 1.3 billion euros in a bribery case that came to light in 2007 and prompted the departure of the company's then-CEO and board chairman.

The company's biggest bank, Deutsche Bank, has also struggled to put behind it lawsuits and legal issues that in some cases date back years.

In April, Deutsche Bank agreed to pay $2.5 billion to authorities in the U.S. and Britain to settle allegations its traders rigged important market interest-rate benchmarks used to determine rates on a variety of debt.

Hartmut Dziemballa, who conducts image research for Germany's GfK institute with a focus on the automotive and airline sectors, said past scandals have not had lingering effects and that he didn't expect the Volkswagen scandal would significantly affect other German manufacturers — even car companies.

"The quality and the German engineering is still there, and people know that," he said.

Still, if a scandal with any brand has the potential to smear the whole "Made in Germany" label, it's Volkswagen, which is deeply interconnected with the country's people and politics.

Germany is the world's third largest exporter, vehicles are its largest export, and Volkswagen is its largest automaker. It employs over half a million people globally.

It's the largest single employer in its home state of Lower Saxony, which owns 20 percent of the company and whose governor and economy minister sit on its board of directors. VW's former personnel director Peter Hartz was also an adviser of former Chancellor Gerhard Schroeder, and today's welfare system is still called "Hartz IV" after his reforms.

Carsten Brzeski, an analyst with ING in Frankfurt, said while "the reputational damage is currently impossible to assess," because of its size even if the main impact of the scandal is limited to Volkswagen it could have serious economic effects on the German economy overall.

"While the German economy defied Greece, the euro crisis and the Chinese slowdown, it could now be facing the biggest downside risk in a long while," he said in a research note.

Analysts say there is the possibility that the fallout from the scandal might affect other car companies, whether through the need for tougher regulation or a shift away from the diesel engines at the center of the U.S. scandal.

Vice Chancellor Sigmar Gabriel told reporters at the auto show in Frankfurt after the news broke that the VW scandal would mean nothing to the "Made in Germany" label — before adding "I hope."

Dealers, owners frustrated over VW scandal

Associated Press 3:21 p.m. EDT September 24, 2015

LOS ANGELES — Bob Rand bought his Volkswagen Passat last year for its clean emissions and high gas mileage. He liked the car so much he convinced his son and a friend to buy one, too.

Now, as Volkswagen comes clean about rigging diesel emissions to pass U.S. tests, Rand is desperately trying to sell the fully loaded model with white leather seats for $10,000 below what he paid. His sole bite has been from a man who offered $7,500 on speculation that he could resell it in Mexico.

"Volkswagen was somebody that you could rely on for cutting-edge products and quality and all those things and now you find out that they're not above lying just flat out," said Rand, who plans to join a class-action lawsuit against VW. "That's probably about as bad a thing as a company can do is lie to your face when you're buying a $35,000 car."

Rand's anger at the world's top-selling car company was echoed Wednesday by private dealers, auto wholesalers and owners across the U.S. as fallout from the smog test trickery mounted.

The EPA first disclosed Friday that stealth software makes VW's 2009-2015 model cars powered by 2.0-liter diesel engines run cleaner during emissions tests than in actual driving. On Wednesday, Volkswagen CEO Martin Winterkorn resigned and took responsibility for the "irregularities" found by U.S. inspectors — a scandal that has wiped out billions in the company's market value and raised the possibility of criminal investigations and billions more in fines.

The revelations left dealers sitting on hundreds of diesel cars they could not sell. Many also dealt with a flood of angry calls, emails and tweets from Volkswagen owners who felt betrayed because they believed they had bought a car that polluted less without sacrificing the good gas mileage and performance that comes with a diesel engine.

"I think their feet should be held to the fire. I think apologies don't mean anything when something is so premeditated," said Joe DeCarolis, of Cary, North Carolina, who owns a 2012 TDI Jetta Sport Wagon — a car he bought after careful comparison shopping for its clean emissions and good gas mileage.

Jon Vitale of Fowlerville, Michigan, listed his 2012 Volkswagen Passat for sale on the Internet last month, barely getting any interested callers.

But after finding out about the scandal, he's thinking the news might actually make it easier to sell his car.

"I don't know if the news will help me or hurt me," said Vitale, who bought the car used two years ago for its gas mileage. "I didn't get much interest before the news came out. If someone wants it, maybe they'll pay more because there's a stop sale on the new models."

Dealers can't give customers good answers because Volkswagen hasn't said a whole lot, said AutoNation CEO Mike Jackson, the leader of the largest auto dealership chain in the U.S.

AutoNation's six Volkswagen and eight Audi dealerships in the U.S. are telling customers that the cars are safe to drive and promising to call them as soon as they know more about repairs. "That's not adequate," Jackson said. "We need answers by next week."

A lot of people within VW had to know about the software that turned emissions controls on during government tests and off for regular driving, especially because the scheme went on for multiple years, Jackson said.

"This tells me that it's not a bad apple. It's not a rogue employee. It's deliberate deception," Jackson said. "It's a systemic failure. This took a lot of meetings. This took a lot of engineers. This took a lot of software programmers to put in place and keep in place."

Meanwhile, concern was growing at private dealerships about what to do with inventory that's now gathering dust.

At Volkswagen of Oakland, California, nearly two dozen new diesel cars have no chance of being sold in the short-term, while 25 2016 model vehicles are being held up at the Port of San Diego because they can't pass emissions standards, sales manager Chris Murphy said. Customers have been calling and emailing to demand the dealership buy their cars back or offer refunds.

"We can't afford to buy all those cars back. We're just one dealer," he said, adding that diesel models make up about 30 percent of the business. "This is definitely going to impact our business. We're trying to focus on positive, not negative things because there's nothing we can do."

Williams Volkswagen in Lansing declined to comment on how the company's actions affected its sales. It's the only Volkswagen dealer in the region.

Vitale thinks used models may become more valuable to some people who aren't as environmentally conscious, particularly because Michigan doesn't require emissions testing.

"I got a call a few days ago and the guy asked me about the news, and despite all that, he still wanted it," said Vitale, who is selling the car because he no longer needs it. "It's not illegal to drive in Michigan because there's no emissions testing here."

Volkswagen has taken steps to help out the dealership, Murphy said. That includes guaranteeing reimbursement for sales objectives for two quarters whether or not the goals are met and waiving the interest the local franchise normally pays on unsold cars on their sales floor, he said.

"They're making all the right steps. … I'm just waiting for everything to get uncovered to see how deep this really goes. I'm not mad at anyone except the people higher up who made these decisions," Murphy said.

Lash Volkswagen of White Plains, N.Y., has been scrambling to accommodate affected Volkswagen owners by giving them loaner cars and picking up or dropping off their cars when it's time for repair, said Tom Backer, general manager of the dealership in New York's Westchester County.

Dealers, he said, were told that there will be both software and hardware changes to fix the problem. They're already on 2016 models and are awaiting approval from the Environmental Protection Agency, Backer said. Older models will get the same fixes, he said.

But not every Volkswagen dealer is fielding calls from angry customers.

Bill Haggerty, a sales manager at a VW dealership in the Chicago suburb of Oak Lawn, Illinois, said he hasn't heard concerns from customers so far. Diesels make up less than 20 percent of his business and draw the most interest from customers looking for better gas mileage, he said.

"We have 200 Volkswagens in stock; three of them are Jetta diesels," he said. "So, it's not like every Volkswagen out there has got a diesel motor in it. They sell an awful lot of cars with good gas mileage and great safety records."

Volkswagen Diesel Scandal: Is The EPA Partly To Blame?

By Cole Stangler @colestangler c.stangler@ibtimes.com on September 24 2015 2:10 PM EDT

Are emissions tests too easy? A Volkswagen car is pictured at a technical and testing center in Zenica, Bosnia and Herzegovina, Sept. 23, 2015. Reuters/Dado Ruvic

Since Volkswagen admitted this week to cheating on pollution tests for years, there has been a flood of outrage. Overwhelmingly, it is directed at the most obvious culprit: the German automaker, which admitted to equipping 11 million of its diesel cars worldwide with software specifically designed to reduce emissions during tests. But some critics argue Volkswagen is not the only one to blame. Are the regulators at fault, too?

"Automakers have been able to exploit lax testing systems in the U.S. and Europe," declared a Bloomberg editorial this week. "Regulators owe it to both car buyers and the environment to make these systems more rigorous."

In the United States, critics say, the Environmental Protection Agency isn't as strong a watchdog as it should be. The editorial board at Bloomberg says the EPA gives automakers like Volkswagen too much latitude in determining testing conditions. The agency doesn't have engineers on hand at the labs that actually conduct the exams, doesn't vary its testing routines enough and should have done more to detect the sneaky software gambit that will likely lead to the recall of some 500,000 cars in the U.S.

The EPA did not respond to requests for comment.

Volkswagen's deception may be particularly widespread and therefore more egregious. But it's not the first company to cheat American emissions standards. Hyundai and Kia acknowledged they overstated fuel economy standards on 1.2 million cars from 2010 to 2012. Last November, the companies agreed to a combined $300 million settlement with the Justice Department and the EPA for doing so.

Still, Tyson Slocum, director of the energy program at consumer advocacy group Public Citizen, said it's unfair "to claim the EPA is responsible for a very sophisticated deception."

Emissions tests in the United States consist of the following: Automakers put their cars on rollers at various testing sites and run them through a set of federally approved maneuvers. Volkswagen duped the system by writing code into its diesel cars' software that automatically switched them

into a sort of “low-emissions mode” during these moves.

Even with a beefed-up team of monitors on hand at testing sites, Slocum said, Volkswagen’s trick “would have been very hard to catch." "Stopping a determined criminal is tough," he said, and “at the end of the day, you’ve got to hold the primary entity accountable.”

At the same time, Slocum said, those complaining about the agency’s oversight methods or regulatory capabilities should turn to federal legislators.

“Congress is to blame for the EPA’s light touch,” he said. He scoffed at the “Chicken Little” attacks from federal lawmakers and industry alike that frequently deride the agency as a jobs killer. Since 2010, the agency has seen its budget decline by 20 percent, or about $2 billion. (Earlier this month, before the emissions scandal broke, 20 members of Congress filed articles of impeachment against Gina McCarthy, head of the EPA.)

Europe’s testing system, on the other hand, is widely seen as more hands-off than the United States'. Automakers there comply with the New European Driving Cycle, a test that got its last major revision in the 1990s. It takes less time to complete than its American counterpart and doesn’t properly simulate real-world conditions, critics contend, and therefore is easier to game. A recent report from the U.K. Committee on Climate Change found the gap between official and real-world emissions of new passenger cars rose from 10 to 35 percent between 2002 and 2014.

Officials from the European Environment Agency did not respond to requests for comment.

Bill Becker is the executive director of the National Association of Clean Air Agencies, a group that represents state and local pollution control agencies. He said “the EPA certainly has a role but they don’t deserve a severe whipping about what happened.”

Those concerned with preventing similar conspiracies in the future should look toward the judicial system, which has the ability to set a strong deterrent effect, he said. Penalties wield far more influence over automaker behavior than any changes to emissions testing procedures.

"The solution here is for the courts and the Justice Department to impose as severe a penalty as possible," he said, "to penalize so harshly that no other employer would ever consider this again."

Germany: VW cars with suspect software in Europe too

By Geir Moulson | AP September 24 at 12:19 PM

BERLIN — The software at the center of Volkswagen's emissions scandal in the U.S. was built into the automaker's cars in Europe as well, Germany said Thursday, though it isn't yet clear if it helped cheat tests as it did in the U.S.

A day after longtime CEO Martin Winterkorn resigned over the scandal, a member of Volkswagen's supervisory board said he expects more executives to step down. The company's supervisory board meets Friday and could announce new resignations then as well as a new CEO.

The U.S. Environmental Protection Agency disclosed Friday that stealth software makes VW's

2009-2015 model cars powered by 2.0-liter diesel engines run cleaner during emissions tests than in actual driving.

The EPA accused VW of installing the so-called "defeat device" in 482,000 cars sold in the United States. VW later acknowledged that similar software exists in 11 million diesel cars worldwide and set aside 6.5 billion euros ($7.2 billion) to cover the costs of the scandal.

The company has told officials that the vehicles in question included VW cars with 1.6-liter and 2-liter diesel engines in Europe, German Transport Minister Alexander Dobrindt said Thursday.

"We don't yet have figures for how many of these 11 million cars that are apparently affected are in Europe," Dobrindt said. "That will be cleared up in the next few days."

Authorities will continue working with Volkswagen to determine what cars exactly are involved.

It isn't yet clear to what extent the scandal affects other brands in the Volkswagen Group, which has 12 brands in all — including Seat, Audi, Skoda and Porsche. It was also not clear whether the software would have led to VW cheating on emissions tests outside the U.S. as well.

Dobrindt this week set up a commission of inquiry to look into the scandal. The motor transport authority is conducting static and road tests on Volkswagen models and spot tests on cars made by other manufacturers, German and foreign.

In neighboring France, Environment Minister Segolene Royal on Thursday announced random tests of about 100 French cars to ensure that their engines meet pollution standards in the wake of Volkswagen's emissions scandal.

And the European Union's executive Commission called on national authorities "to look into the implications for vehicles sold in Europe and ensure that EU pollutant emission standards are scrupulously respected."

Olaf Lies, economy and transport minister of VW's home state Lower Saxony, which holds a 20 percent stake in the company, said the investigation into the scandal was only just starting.

"There must be people responsible for allowing the manipulation of emission levels to happen," he told rbb-Inforadio.

Winterkorn said Wednesday he took responsibility for the "irregularities" found by U.S. inspectors in VW's diesel engines, but insisted he had personally done nothing wrong.

VW is filing a criminal complaint with German prosecutors, seeking to identify those responsible for any illegal actions in connection with the scandal.

Other auto companies have seen their shares drop, too, though there have been no allegations they cheated emissions tests.

On Thursday, shares in BMW dropped 5.2 percent to close at 75.68 euros after Germany's Auto Bild magazine reported that road tests by the International Council on Clean Transportation showed the BMW X3 xdrive model exceeding European emissions limits by more than 11 times. It did not say what the cause for the alleged problem was.

BMW said in a statement that it was not familiar with the test and would ask the ICCT for clarification. It said that "the BMW Group does not manipulate or rig any emissions tests."

Exclusive - VW recall letters in April warned of an emissions glitch

SAN FRANCISCO | BY ALEXANDRIA SAGE

In April of 2015, Volkswagen of America, Inc.(VOWG_p.DE) sent letters to California owners of diesel-powered Audis and Volkswagens informing them of an "emissions service action" affecting the vehicles.

Owners were told they would need to take their cars to a dealer for new software to ensure tailpipe emissions were "optimised and operating efficiently."

The company didn't explain that it was taking the action in hopes of satisfying government regulators, who were growing increasingly sceptical about the reason for discrepancies between laboratory emissions test results and real world pollution from Volkswagen's diesel cars.

Officials at the California Air Resources Board and the EPA agreed in December of 2014 to allow a voluntary recall of the company's diesel cars to fix what Volkswagen insisted was a technical – and easily solved - glitch. The recall was rolled out nationally over a period of months.

On Wednesday, California Air Resources Board spokesman Dave Clegern confirmed that the letters were part of that recall. "This is one of the fixes they presented to us as a potential solution. It didn't work," he said.

Volkswagen, which had no obligation at the time it initiated the recall to disclose the discussions that had led to it, declined to comment on the letter.

The controversy came to public attention last week after Volkswagen acknowledged it had deliberately deceived officials about how much its diesel cars polluted.

The recall letter instructed owners of certain 2010-2014 Volkswagen vehicles with 2-liter diesel engines to contact dealers for a software update in order to fix an issue with the malfunction indicator light illuminating.

“If the [light] illuminates for any reason, your vehicle will not pass an IM emissions inspection in some regions,” the letter warned, noting that California required the update before it would renew vehicle registrations.

"The vehicle's engine management software has been improved to assure your vehicle's tailpipe emissions are optimised and operating efficiently," read the letter, which said an earlier software update increased the likelihood of the light illuminating.

It is customary for carmakers to perform updates to their cars through dealerships to fix or update software.

Volkswagen has said that 11 million of its cars around the world could be affected in the scandal that broke last week. The German company has set aside 6.5 billion euros ($7.3 billion) in its third-quarter accounts to help cover the costs of any fallout.

The U.S. Justice Department has launched a criminal probe and at least 25 proposed class actions on behalf of consumers have already been filed in seven states.

VW’s Customers Feel Confusion, Remorse

Auto owners worry how emissions scandal will affect vehicles' performance, resale value and compliance with clean-air standards

By CHRISTINA ROGERS in Detroit and ERIC SYLVERS in Milan

Deborah Scott went shopping for a new car in 2010 and came back home with a diesel station wagon made by Volkswagen AG. Fuel efficiency, low emissions and a peppy engine won her heart.

Now, she finds herself suffering from a case of buyer's remorse. "I feel very confused," said the 61-year-old retired nurse practitioner from Chattanooga, Tenn.

Less than a week ago, the Environmental Protection Agency said the German maker of her car lied about its diesel-emissions performance and is demanding a fix on nearly 500,000 affected vehicles on U.S. roads. That leaves owners, such as Ms. Scott, wondering how that will affect performance, resale value and compliance with clean-air standards.

"I feel like I'm eventually not going to have the car that I initially agreed to buy," said Eric Schoenecker, a Minnesota owner of a 2013 diesel Jetta. A recent visit to Craigslist.com indicated resale value on cars like his have fallen 20% since the emissions scandal emerged. The EPA says affected Volkswagens emit nitrogen oxides at up to 40 times the standard.

Volkswagen's emissions headache has gone global, with the auto maker now saying 10.5 million additional vehicles could be affected outside the U.S. On Wednesday, the company's chief executive resigned amid a sharp decline in market value and many investigations initiated in various countries.

Buyers, however, are primarily interested in answers that aren't immediately forthcoming.

"All we've received so far are talking points from VW emphasizing that we tell customers this is not a safety issue," Mike Jackson, chief executive of No. 1 car dealer chain AutoNation Inc.,

said. “They tell us they will get back to us on how they will bring cars into compliance.”

Volkswagen representatives said the company is investigating the matter and will be in touch with dealers and buyers as soon as possible.

Dealers say traffic in Volkswagen showrooms is drying up in the U.S., deepening the pressure the auto maker has experienced in recent years as market share has fallen. “As this story matures, we expect it to have more of an impact on sales,” said one dealer, choosing to remain anonymous.

Volkswagen has 650 dealers in the U.S., and sold 238,000 vehicles through August—a 2.8% decline from the same period in 2014 and far below other major auto makers selling cars in America. About 20% of those deliveries are diesel.

At some point, those dealers will need to employ a fix, according to EPA guidelines. Volkswagen, setting aside $7 billion for the crisis, will have to pay for repairs. Meanwhile, cars are likely to pass emissions standards because they are fitted with a device that enables cheating on emissions tests, the EPA said.

Anna Stefanopoulou, a mechanical-engineering professor and engine expert at the University of Michigan, said a permanent fix could be as simple as downloading new software for the car. Or, Volkswagen could be looking at a cost of $2,000 a vehicle if new hardware needs to be installed.

Fuel economy, rated at more than 40 miles a gallon for some diesel models sold by VW, will take a hit. Consumption could rise 5% to 7% at high speeds or other driving conditions because components needed to clean emissions can dent engine performance.

Some doubt the solution will be simple.

“A software fix in the U.S. seems very unlikely because the emissions are so much higher than is

allowed," Paolo Martino, a Frost & Sullivan consultant, said. Any adjustment would probably so radically "change the performance of the cars that consumers would no longer want to own them.

Wired:

http://www.wired.com/2015/09/vw-going-pay-smog-scandal-much/

Eric Niiler

VOLKSWAGEN ISN'T GOING to get away with this. You don't (allegedly!) fake emissions data for a few million cars and just walk away. But what the German automaker's punishment will be, and how much it's going to hurt—those are still open questions.

The final decision will be up to lawyers at the US Environmental Protection Agency and Department of Justice. That latter agency has opened a criminal probe into the company's (alleged!) emissions software tampering shenanigans. But based on precedent and the outlines of what Volkswagen actually seems to have done, we can make a few predictions.

If US officials absolutely throw the book at VW, EPA rules stipulate a maximum fine of $37,000 per affected car. At 482,000 cars on American roads, that comes to $18 billion. But according to attorneys who work on these kind of cases, that number is way too high for what'll actually happen. The biggest fine of this kind to date was $1.2 billion, a criminal penalty that Toyota paid in 2014 for concealing information about faulty ignition switches that triggered sudden accelerations.

But that was for a mechanical breakdown. For a closer analogy we could look back to 1998, when seven truck manufacturers including Caterpillar and Mack together paid $1 billion for installing defeat devices—sounds familiar—in tractor trailer and pickup trucks. A year before, Ford paid a relatively paltry $7.8 million to settle allegations the company violated the Clean Air Act by yes, installing defeat devices—this time in Econoline vans. But the company also paid $2.5 million in emissions offsets and $1 million to study new technology that fought emissions.

So it's possible VW might have to pony up for regulatory violations as well as smog offsets for what they actually emitted.

As a matter of process, regulators will want a fine that's big enough to work not only as punishment for VW but as a deterrent to anyone else who might think about trying something similar. It can't just be the cost of doing business. "There aren't a lot of examples of this kind of conduct," said one private attorney who has handled pollution settlements between major companies and the government. "There are a fair number for failure to disclose, or even covering it up. But to actually plan a violation? That's pretty extraordinary. This will be the highest penalty EPA ever assesses."

Yeah, but how high? To figure that out, EPA lawyers have a lot to consider. Specifically, EPA will want to know what kind of economic benefit VW got from rigging emissions controls. The company claimed greater engine power, performance, and gas mileage, and charged more for the engine than a gasoline engine in a comparable vehicle. VW also got a marketing benefit, donning a green mantle by touting its "clean diesel" technology.

On the other hand, EPA regulators will also factor in what VW does to fix the problem. The company said Tuesday it was setting aside more than $7 billion for repairs. EPA might build that consideration into its calculations and lower the fine accordingly.

That's all on the civil, regulatory side. DOJ's criminal probe could lead to prosecutions of the executives in Germany who approved the so-called "defeat device." Like the bumper sticker says, a fine is a tax for doing wrong. Prison time, though? That's a whole other kind of serious.

But if you believe Gilbert and Sullivan and think the punishment should fit the crime, than what was this (alleged!) crime's actual shape? Yes, VW diesel-powered Jettas, Passats, Golfs, and Beetles (and an Audi) polluted more during real-world driving than their annual smog tests said they would. But how much more? Tests performed by the International Council on Clean Transportation in 2013 revealed that the VW cars emitted anywhere from 5 to 35 times more nitrogen oxide pollution than allowed by law. So with the help of some air pollution experts, let's do a little back-of-the-envelope figuring. Making it easy on ourselves, we'll use a midpoint of a 20X increase in emissions. Assuming 482,000 cars in the United States with, oh, say, a 120,000-mile lifetime of a diesel engine, VW's US fleet produced 46,657 more tons of harmful, smog-forming NOx pollution than anyone knew.

Now, cars in California alone emitted 161,000 tons of NOx in 2011, according to EPA. (California has a lot of cars.) But still—that's a lot more smog than anyone planned for.

How many deaths did Volkswagen's pollution scandal cause?

A back-of-the-envelope estimate.

Updated by Brad Plumer on September 24, 2015, 8:58 a.m. ET @bradplumer brad@vox.com

This week, Volkswagen admitted that it had secretly rigged as many as 11 million diesel cars worldwide so that their pollution controls only worked when they were being tested by regulators. The rest of the time, while the cars were actually being driven, they emitted smog-forming nitrogen oxides at 15 to 35 times higher than the US legal limit.

So how much extra pollution is Volkswagen's deception responsible for? And, since we know air pollution is already harmful, how many additional deaths might those extra emissions cause? What follows is a very rough, back-of-the-envelope estimate based on what we know so far. (Spoiler: the premature death numbers range from single digits to hundreds per year. Like I said, rough.)

1) How much extra pollution do Volkswagen's cars cause? By my calculations, Volkswagen's 482,000 deceitful US cars are currently adding between 5,800 to 14,200 additional tons of nitrogen oxide pollution (NOx) to the atmosphere per year, assuming the cars are driven the US average.*

Extrapolating that out to 11 million cars around the world, and assuming the rest of the cars are

driven the European average, we get somewhere between 86,800 and 212,500 additional tons of NOx emissions per year.**

Now, there are lots of assumptions and simplifications embedded in those estimates, particularly around how many miles VW's cars are actually driven. But that's ... potentially a large amount of extra NOx pollution. At the high end globally, it's 20 times what a typical coal plant without emission controls puts out in a year.

2) How many deaths might that extra pollution cause? We know NOx pollution is harmful — current emissions from all the world's cars, trucks, factories, and power plants already cause various health ailments and contribute to thousands of deaths each year. What we're interested in is the additional toll caused by Volkswagen's illegal pollution.

This is a bit trickier to calculate. Certain types of nitrogen oxides are harmful both both because they can irritate the lungs and because they can help form damaging particulate pollution and smog. Higher smog levels have been linked to respiratory illnesses, increased asthma attacks, and even premature deaths (especially among the sick or elderly). The complicated part is that the exact levels of smog formation can vary from place to place, depending on sunlight, temperature, local winds, and other factors. What's more, the exact harm can depend on where the pollution occurs, how dense the area is, and so on.

Still, we can get ballpark figures using data from the Environmental Protection Agency, which calculates that every ton of NOx from vehicles in the United States leads to somewhere between 0.00085 and 0.0019 premature deaths. (Note that this only includes impacts from particulate formation, not smog effects, which are harder to quantify. See p. 40 of this report.)

Using these figures, the estimated extra pollution from Volkswagen's US cars can be expected to lead to an additional 5 to 27 premature deaths per year. If we extrapolated worldwide to all 11 million vehicles, that would come to somewhere between 74 and 404 premature deaths each year.***

Again, this is a back-of-the-envelope exercise, not a peer-reviewed scientific analysis. Criticisms and refinements are welcome. But the broader point is that air pollution can cause genuine harm, up to and including killing people. The United States and Europe have been trying to limit that

health damage over the last 50 years by putting pollution limits in place. And, by evading those limits, Volkswagen's actions had real consequences.

(As counterpoint, Volkswagen's cheating might have been mildly helpful for global warming efforts. The company appears to have rigged the cars so that they would get slightly better fuel economy. And NOx emissions can have an indirect cooling effect. That said, this effect is likely to be smaller in the grand scheme of things. And this really isn't the way to go about solving climate change...)

Footnotes and updates:

* Here's how I estimate US pollution: the current Tier2-Bin5 lifetime standard for NOx emissions in the United States is 0.07 grams per mile driven. Testing by the ICCT has said Volkswagen's 482,000 clean diesel cars in the United States were emitting NOx at 15 to 35 times that standard, depending on how they were driven. And the average US car is driven 11,244 miles in a year. So multiply those numbers together, subtract out the "legal" pollution, convert to tons, and you get your range of additional pollution caused by VW's cars.

(Note that this estimate is for the current year. VW's cars were obviously sold in stages, so the pollution impact is smaller the further you go back in time.)

** For the global figures, I'm assuming the pollution controls in the remaining 10.5 million Volkswagen diesel cars with a Type EA 189 engine worked the same way and produced similar levels of additional pollution. I've updated this section by also assuming the rest of the cars were driven the European average of around 7,170 miles per year (since most of them were likely in Europe). That lowered the global pollution estimates from an earlier version.

*** This global estimate of health impacts might well be low, since a simple extrapolation from US data isn't ideal. The World Health Organization's research suggests that NOx pollution can have even higher mortality effects in some parts of Europe (due to higher population density), but we'd really have to know where the rest of Volkswagen's 11 million problematic diesel cars are being driven to get any more precise.

Volkswagen and the EPA's Dirty Little Secret

87 SEPT 23, 2015 3:50 PM EDT

By Editorial Board

Cheating reflects badly, first and foremost, on the cheater -- and so it is with Volkswagen, whose shocking manipulation of U.S. emissions tests continues to exact a price in market value, legal costs and reputation. At the same time, it's not unreasonable to ask how the cheating happened in the first place, and that question implicates more than just Volkswagen.

For years, automakers have been able to exploit lax testing systems in the U.S. and Europe. Regulators owe it to both car buyers and the environment to make these systems more rigorous.

As things work now in the U.S., carmakers test their own vehicles and send the results to the Environmental Protection Agency, whose engineers review them and, usually, apply a rubber stamp. The EPA allows manufacturers broad latitude in determining test conditions, an invitation to hanky-panky. The agency does some independent, random testing -- but on just 10 percent to 15 percent of new models. Only in rare cases does it test cars that have actually been driven off the lot.

The problems with this regime were obvious even before VW's shenanigans. In 2013, Consumer Reports found that 55 percent of hybrids and 28 percent of turbocharged cars fell short of their EPA fuel-efficiency ratings. Last year, the Justice Department reached a $350 million settlement with Hyundai and Kia for overstating gas mileage. Ford, Mercedes, Mini and other manufacturers have restated their official mileage ratings in the last three years, usually under threat of consumer lawsuits.

Europe, where automakers also test their own vehicles, has its own issues. Just before the VW scandal broke, a European environmental advocacy group released test results showing major discrepancies between lab and real-world emissions in cars made by BMW, Mercedes and Opel. The European Commission has announced that all passenger cars will be undergo "real world" emissions testing starting in 2017.

Any system will inevitably rely on self-reporting to some extent. Government regulators simply don't have the money or personnel to test every new vehicle. But they can enact safeguards on a system that is all too easy for carmakers to game.

First, the EPA should have some of its engineers on hand at the industry labs to oversee compliance. Carmakers have a bevy of little tricks that can increase efficiency -- low-resistance tires, removing side mirrors and taping over cracks between panels -- and while the EPA has done better than the Europeans at closing loopholes, vigilance must be maintained. The agency should also vary the testing routines periodically so that carmakers won't know in advance exactly what they are in for. (The current regime's predictability may well have been a big part of VW's successful deception.) The EPA should consider following the EU's lead with on-the-road studies, for gas mileage as well as pollutants.

Also, the so-called defeat device VW used to game the emissions test was actually a pretty simple software tweak. It shouldn't be too hard for the EPA to invest in some computer forensic capabilities to track what's going on in our increasingly computerized vehicles.

Just as important, there need to be greater consequences for cheating. Any company caught in violation should lose its self-monitoring rights for a number of years. It should have to dig into its own pockets for trials by neutral third parties, such as parts manufacturers, which have the necessary equipment.

What Volkswagen did appears to be in a category all its own, and it deserves special condemnation. But other carmakers game the system, and regulators tolerate it. That is the dirty little secret of emissions and efficiency testing, and the EPA needs to clean it up.

Financial Times:

http://www.ft.com/intl/cms/s/0/bbd61c58-62d7-11e5-9846-de406ccb37f2.html#axzz3mgG3bZd2

EPA surprised by scale of Volkswagen's deceit

Barney Jopson in Washington and Andy Sharman in London

The US regulator that exposed Volkswagen for cheating on emissions tests has been taken aback by revelations that the German carmaker's deception extended to millions of vehicles far beyond American shores.

"It's clear that the company went above and beyond in its efforts to game the system and deceive consumers. The agency has a very robust emissions testing programme. So this deceit was significant," according to a senior Environmental Protection Agency official close to the investigation.

The EPA announced on Friday that VW had admitted installing "defeat device" software on 482,000 cars in the US.

But VW then shocked the regulator and the markets — sparking a two-day 37 per cent fall in its share price — by revealing that up to 11m vehicles worldwide could be affected.

"It's been surprising to see the scale of the deceit in terms of the number of vehicles impacted," the official said.

On Thursday the German government said VW executives had admitted to manipulating emissions tests on diesel-powered vehicles in Europe as well as the US.

The EPA official told the Financial Times the US regulator had been "engaged" with the German government over the matter even as it continued its own investigation.

"You'll continue to see news coming out of the agency on this" relating to VW, the official added.

The regulator is also "considering what our options are" regarding other auto manufacturers.

Several companies have come forward to say they have not engaged in similar cheating, the official said, and the EPA will continue working to ensure that is the case.

The EPA's concern about VW behaviour relates not just to the installation of defeat devices but to more than a year of dialogue between the regulator and the carmaker, another EPA official said. During that period VW repeatedly sought to attribute the difference between its cars' test results in the lab and on the road to a "technical glitch".

In May 2014, the EPA and a California state regulator were alerted to emissions discrepancies with a 2012 Jetta and a 2013 Passat by researchers at West Virginia University, which had analysed the results with the International Council on Clean Transportation, a non-profit research group.

Laboratory tests showed the VW cars complied with Clean Air Act rules, but when tested on the road the Passat's emissions were five to 20 times the official test result and the Jetta's emissions were 15 to 35 times the lab reading.

The German carmaker is engulfed in the worst scandal in its 78-year history over findings it manipulated diesel emissions test data in the US and Europe to make its vehicles appear less polluting

Following the West Virginia study, VW continued to assert that the increased emissions from the vehicles could be attributed to "various technical issues and unexpected in-use conditions", according to an EPA letter to VW about the violations last week.

VW tried — and failed — to fix the apparent problem with a voluntary recall last December affecting half a million vehicles in the US.

Only when the EPA told VW that it would not certify its 2016 models as emissions compliant did VW admit to the regulator on September 3 that it had used the defeat device.

The EPA carried out additional inquiries over the following 10 days to two weeks before deciding that it would send the company the official "Notice of Violation" released last Friday, the senior official said.

Volkswagen boss quits over diesel emissions scandal

BERLIN | BY ANDREAS CREMER

Volkswagen (VOWG_p.DE) Chief Executive Martin Winterkorn resigned on Wednesday, succumbing to pressure for change at the German carmaker, which is reeling from the admission that it deceived U.S. regulators about how much its diesel cars pollute.

"Volkswagen needs a fresh start - also in terms of personnel. I am clearing the way for this fresh start with my resignation," Winterkorn said, following a marathon meeting with the executive committee of the VW board.

The world's biggest carmaker by sales has admitted to U.S. regulators that it programmed its cars to detect when they were being tested and alter the running of their diesel engines to conceal their true emissions.

Volkswagen did not name a successor, but said proposals on management appointments would be made to a full board meeting on Friday.

Porsche chief Matthias Mueller, Audi chief Rupert Stadler and the head of the VW brand, Herbert Diess, are seen as the front-runners to replace Winterkorn, three people familiar with the matter said. Mueller is seen as the favourite among the three due to his years of experience within the group, two of the people said.

Mueller, a former head product strategist, is also a management board member of Porsche SE (PSHG_p.DE), and so close to the Piech-Porsche family that controls Volkswagen.

Winterkorn, who during his eight years in charge oversaw a doubling in Volkswagen's sales and an almost tripling in profit, said he was shocked that misconduct on such a massive scale had been possible at the company.

The carmaker was under huge pressure to take decisive action, with its shares down more than 30 percent in value since the crisis broke.

German Chancellor Angela Merkel had urged Volkswagen to move "as quickly as possible" to restore confidence in a company held up for generations as a paragon of German engineering prowess.

The U.S. Environmental Protection Agency (EPA) said on Friday Volkswagen could face penalties of up to $18 billion.

Since then the crisis has snowballed, with the U.S. Justice Department launching a criminal inquiry, according to a source familiar with the matter. European and Asian countries as well as Canada have also said they are investigating the matter.

Senior members of Volkswagen's board said in a statement they expected more heads to roll as

an internal investigation seeks to identify who was responsible for the wrongdoing.

German Economy Minister Sigmar Gabriel said Winterkorn was taking responsibility for decisions made when he was at the helm of Audi, rather than Volkswagen.

The VW Emission Bug

Why would the company install a 'defeat device' on its U.S. cars?

Sept. 23, 2015 6:38 p.m. ET

Volkswagen AG's reputation and share price have taken major hits after the Environmental Protection Agency and California Air Resources Board (CARB) last week accused the German auto maker of gaming vehicle-emission rules. VW deserves a keelhauling if the charges are true. But regulators and VW first should produce the motive and method for the alleged malfeasance.

On Friday the EPA in conjunction with CARB charged VW with installing "defeat devices" that disable nitrogen oxide emission controls in five of its clean-burning diesel models. EPA has threatened up to $18 billion in fines for the nearly half million cars VW sold in the U.S. between 2009 and 2015 that contain the device. The Justice Department is investigating.

VW's stock has since plummeted nearly a third. On Sunday CEO Martin Winterkorn promised to cooperate with regulators "to clearly, openly, and completely establish all of the facts of this case," including an external investigation. Volkswagen's U.S. chief Michael Horn apologized and said the company had been "dishonest."

On Tuesday VW said 11 million diesel cars world-wide were equipped with the device and it would set aside $7.3 billion, more than half of its annual profits, to cover penalties and recall costs. On Wednesday Mr. Winterkorn resigned. The slow-rolling revelations raise more questions.

To wit: Who decided to install the bugs, and what was their motivation? Did VW executives approve or know? Do the devices serve a purpose other than evading U.S. emission regulations? The public knows little outside the government narrative provided by EPA and CARB letters to VW last Friday.

The government investigation was prompted by a 2014 research project between West Virginia University and environmental nonprofit International Council on Clean Transportation, which found that NOx emissions from VW's 2012 Jetta and 2013 Passat soared in real world driving conditions and exceeded Clean Air Act regulations by five to 35 times.

After CARB confirmed the disparity between on-road and lab testing, VW in December 2014 recalled a half million cars to make software fixes. In May CARB reran its on-road test and determined that VW's adjustments didn't significantly reduce NOx emissions. CARB says it then met several times with VW, which suggested potential technical justifications for the discrepancy.

However, after the agencies threatened to withhold government certification for its 2016 diesel models, VW on Sept. 3 said the vehicles contained a "defeat device" to disable NOx emission-controls under normal driving conditions.

According to EPA, a software switch senses whether the car "is being tested or not based on various inputs including position of steering wheel, vehicle speed, the duration of the engine's operation and barometric pressure" and these "inputs precisely track the parameters of the federal test procedure." Under normal driving conditions, the switch activates a separate engine calibration.

In other words, the cars are electronically programmed to produce compliant emissions results only during government testing. On highways and streets, they spew 10 to 40 times as much as allowed under U.S. law.

Defeat devices aren't new or a diabolical German invention. As EPA notes, mechanisms that deactivate emissions controls may serve a legal purpose if they protect vehicles against damage. But manufacturers are then required to disclose to regulators their presence in certification applications, which VW didn't.

Two decades ago GM had to cough up $45 million for installing defeat devices in nearly half a million cars that overrode carbon monoxide controls. In 1998 seven U.S. manufacturers of heavy-duty diesel engines, including Caterpillar and Volvo Truck, settled federal charges of implanting devices that disabled NOx controls for $1 billion.

What regulators don't ever explain is that these defeat devices serve a functional purpose, which is usually to increase performance and fuel efficiency. They want to pretend that emissions regulations are a clean, free ride. Until now, VW—which advertised its environmental friendly and powerful engines—was in on the charade.

Auto experts have posited that VW's defeat device was intended to boost fuel economy and torque, which are two big draws of modern diesel cars. VW's 2015 Passat gets 44 miles per gallon on highways. Trouble is, engines that are designed to burn more efficiently—and therefore emit less carbon—release more NOx. They also have less oomph. EPA and CARB should fess up to this trade-off, and the wrongdoing involved ought to be precisely identified.

The immediate upshot is that VW will have to recall the lemons to bring them in compliance with government rules. Any fix will likely cost several thousand dollars per vehicle, reduce performance and increase carbon emissions. Will drivers even want the government's clean bill of health?

VW deserves to pay for any intentional wrongdoing, but the rest of the industry and the country need to know whether this is the great deception that EPA alleges or the kind of well-known regulatory trade-off that is being harshly punished for the first time.

This Small Study Helped Expose Volkswagen's Deception

Victor Luckerson @VLuck 11:15 AM ET

Their findings have been public for months

Before the Environmental Protection Agency was threatening Volkswagen with up to $18 billion in fines for cheating on emissions tests, a small research team in West Virginia already knew something was wrong with the automakers' vehicles.

A five-person engineering team at West Virginia University led by Daniel Carder first discovered discrepancies in the emissions rates for VW vehicles way back in 2013. The findings were made public about a year and a half ago, according to Reuters. "We actually presented this data in a public forum and were actually questioned by Volkswagen," Carder said.

Carder and his team initially though their testing was faulty because the results of their road tests were so out of whack with EPA standards. The findings were later corroborated by the EPA and the California Air Resources Board, leading to Volkswagen's admission that it installed illegal software in 11 million of its diesel cars to cheat on emissions tests. Volkswagen AG CEO Martin Winterkorn stepped down Wednesday; a replacement has not yet been named.

Carder said seeing his findings confirmed and watching Volkswagen become embroiled in controversy was not especially exciting for him. "Obviously, we don't want to see something spewing emissions and polluting the environment," he told Reuters. "But we really have no horse in the race, as they say."

Detroit News:

http://www.detroitnews.com/story/business/autos/foreign/2015/09/24/vw-caught/72715074/

How VW got caught cheating emissions tests

David Shepardson, Detroit News Washington Bureau 12:14 a.m. EDT September 24, 2015

Washington — Volkswagen's monumental crisis over emissions-test cheating — which forced the resignation of its longtime CEO on Wednesday and threatens to cost the German automaker at least $7.3 billion — began with a routine test led by researchers in West Virginia two years ago.

Without that chance finding, VW might never have been caught using a bit of hidden software that allows pollution-control systems on 2.0-liter diesel cars to work normally when being tested for harmful emissions coming out of the tailpipe — but shuts those systems off during regular driving. That allowed 11 million cars worldwide to produce up to 40 times the allowable smog-forming pollution allowed in the United States.

"We're a tiny, non-governmental organization," Drew Kodjak, executive director of the International Council for Clean Transportation, said in an interview Wednesday. "It was really happenstance that this was ultimately uncovered."

In 2013, his organization commissioned a study of VW diesels by West Virginia University after questions were raised about European diesel emissions standards and whether European vehicles were emitting too much nitrogen oxides linked to smog. Testers looked at three diesel cars for the U.S. market: a 2012 VW Jetta, a 2013 VW Passat and a BMW X5.

The group expected the cars they tested would perform better than those in Europe, because U.S. regulations are tougher. They were surprised the two Volkswagens had significantly higher-than-expected emissions, while the BMW performed well. They were so certain they had done something wrong that they tested the cars two more times with similar results.

The researchers made their findings public in May 2014 in a report that got little attention. But it caught the notice of the Environmental Protection Agency and California Air Resources Board, which opened investigations.

The Detroit News has learned that, in response to tests by the EPA and CARB, the automaker actually issued two separate recalls labeled as service campaigns for certain cars: one in December 2014, another in March. Software patches were VW's remedy, and the automaker assured the EPA and CARB that they fixed the problem. Out of 390,000 cars identified by VW at the time, about 196,000 were reflashed with new software.

CARB began testing VW's remedy in May. The California agency had developed a special dynamometer that showed the emission controls in the Volkswagens were not working properly. The software patch, in fact, did not cut exhaust emissions.

At the time, government officials never suspected VW was intentionally cheating. They kept looking for other potential problems. All summer long, VW kept offering "explanation after explanation," a person involved in the talks said Wednesday. "They did not add up."

Even through early August, government officials believed the automaker was acting in good faith. They thought other issues like a bad "dosing sensor" or a test problem could have accounted for the results.

In early August, EPA and CARB officials met with VW at an annual automotive conference in Traverse City to talk about the problem. By that time, California and EPA were withholding certification allowing 2016 diesel models to be sold until they were sure the recall fix would address the problem. VW said it had everything fixed.

Finally, at a conference in California on Aug. 20, an official from VW could not answer technical questions and admitted it had been intentionally cheating through so-called "defeat devices."

After months of work and testing, government officials were shocked at VW's admission of fraud.

The deception was sophisticated: Electronic control modules told the emissions controls to only work during emissions testing — something the computer could determine by the steering wheel position and other factors. That turned out to be a big clue for government investigators.

In a typical car, a dashboard indicator is supposed to light up if it's emitting more than allowable emissions. The Detroit News has learned the VW diesels were programmed not to activate those onboard diagnostics required of all cars since 1996 under the Clean Air Act.

On Friday, the EPA and CARB announced Volkswagen had admitted to installing defeat devices on 482,000 2009-15 Volkswagen Jetta, Passat, Sportwagen, Beetle and Audi A3 cars with 2.0-liter engines sold in the U.S. That included the 390,000 cars initially identified by the automaker, plus another 92,000. The cheat caused the cars to emit 10-40 times the allowable pollution.

By Tuesday, the automaker disclosed that 11 million diesel cars worldwide may have evaded clean-air rules. It could face U.S. fines of up to $18 billion — $37,500 per vehicle — as well as criminal prosecution.

People are shocked at the fraud, Kodjak said, "because of the deliberate nature, and the fact that this came from one of the greenest countries that's known for being extremely law-abiding."

Analysts speculated there are only three advantages to such a device: VW may have wanted to get higher fuel economy for the cars, better performance or avoid more expensive emissions controls like those on larger diesel VWs.

Industry, government and researchers say the automaker could have avoided criminal investigations and massive worldwide lawsuits linked to the admission that they cheated on emissions tests if their software fix had actually worked.

"Why didn't it work? That is literally one of my biggest questions is why didn't it work," Kodjak said. If it had, investigators may never have learned about VW's intentional fraud. "California told you they were going to check. If they had just fixed it then ... the only answer I can surmise is it is not easy."

Government officials expect VW will have to come up with three separate fixes since there are three generations of diesel engines that use different systems to prevent the release of smog-causing nitrogen oxides. It is not yet known whether a new software patch will suffice, or if new pollution-control equipment must be installed.

Boston Globe:

https://www.bostonglobe.com/business/2015/09/23/how-many-volkswagen-vehicles-massachusetts-are-affected-recall-lot/nxliz8S0LU9v5aEPyXbNmJ/story.html

How many Volkswagen vehicles in Mass. are affected by the recall? A lot

By Callum Borchers GLOBE STAFF SEPTEMBER 23, 2015

The tally is in on the number of diesel-engine Volkswagens in Massachusetts that will be subject to recall: 11,674.

According to the Registry of Motor Vehicles, that's how many cars fit the makes, models and years identified by the US Environmental Protection Agency as having a so-called "defeat device" that made them appear cleaner in emissions tests than they actually were on the road.

The EPA determined the vehicles — marketed as "clean" diesel cars — spew as much as 40 times what federal pollution limits allow.

Volkswagen chief executive Martin Winterkorn resigned Wednesday but claimed he did not know about the company's effort to cheat emissions tests, saying he was "stunned that misconduct on such a scale was possible in the Volkswagen Group."

Combining the EPA's description of affected vehicles with RMV statistics, the following list shows how many diesel cars of each type have been recalled in Massachusetts:

- Jetta model years 2009 to 2015: 3,562

- Jetta Sportwagen model years 2009-2014: 3,926

- Beetle model years 2012 to 2015: 81

- Beetle Convertible model years 2012 to 2015: 95

- Golf model years 2010 to 2015: 1,489

- Golf Sportwagen model year 2015: 159

- Passat model years 2012 to 2015: 1,998

- Audi A3 model years 2010 to 2015: 364

The EPA said roughly 482,000 cars nationwide are affected by the recall, and Volkswagen said the worldwide total exceeds 11 million.

The Tennessean:

http://www.tennessean.com/story/news/politics/2015/09/22/tn-senate-leader-requests-hearing-on-volkswagen-issues/72625196/

TN Senate leader requests hearing on VW cheating issues

Dave Boucher

A leader in the Tennessee Senate is asking a fellow lawmaker to call a hearing to look at how cheating revelations regarding Volkswagen may affect the state.

Senate Speaker Pro Tem Bo Watson, R-Hixson, notes the German automaker's significant investment in Tennessee as a reason he wants Senate Finance, Ways and Means Committee Chairman Randy McNally, R-Oak Ridge, to schedule a hearing.

"While all of the relevant facts may remain unreported at this time, I am very concerned as to the financial impact these violations could present to the state of Tennessee," Watson writes.

"As the chairman is aware, Tennesseans have made a significant investment in Volkswagen and any action that threatens the stability and sustainability of the investment should be reviewed by the finance committee, without delay," he continued later in the letter.

Tennessee provided Volkswagen with $165 million in grants in connection to its massive facility in Chattanooga, where more than 3,200 people are employed. Volkswagen received more than $577 million in incentives to build the plant in Chattanooga in 2008, The Associated Press reported. The AP also noted another state and local package worth up to $300 million was offered last year to persuade VW to expand the Chattanooga plant to build a new SUV in Tennessee as opposed to elsewhere.

Volkswagen CEO Martin Winkerton apologized Tuesday in the wake of accusations from the U.S. Environmental Protection Agency that the company had intentionally installed software that allowed its cars to cheat in emissions tests. The company said the emissions software affected 11 million cars worldwide.

On Tuesday it was reported the company has set aside more than $7 billion in anticipation of fines. USA TODAY reported recently that the car company could face $18 billion in fines from the federal government.

Volkswagen sets aside $7.3B over emissions scandal

On Monday Gov. Bill Haslam said he was concerned when he heard the revelations. He said he'd only spoken briefly with representatives from the EPA and Volkswagen.

"Volkswagen is somebody that is a major partner for us in the state of Tennessee, both in terms of investment and the jobs created. We're obviously very interested in their continued growth, but they're going to have to address this issue," Haslam told reporters Monday.

Lt. Gov. Ron Ramsey, R-Blountville, told the Chattanooga Times Free Press that the revelations are "depressing, hard to believe. On and on. We've made a huge investment."

Watson asked McNally to call the public meeting to discuss potential impact on Tennessee as soon as possible.

Volkswagen Sets Aside $7.2 Billion to Pay for Emissions Cheating Scandal

by PAUL A. EISENSTEIN

Volkswagen said Tuesday it is setting aside more than $7.2 billion to cover the anticipated cost of resolving its diesel emissions cheating scandal, a figure that could be eclipsed by potential penalties and lawsuits facing the German automaker in the U.S.

The issue, meanwhile, now is spreading to other markets, with VW confirming it used the same illicit software - dubbed a "defeat device" by U.S. regulators - on 11 million diesel vehicles sold worldwide. That has triggered calls for new investigations in markets from South Korea to the European Union.

The money that VW is setting aside, 6.5 billion euros, is part of the company's efforts to "win back the trust of our customers," VW said in a statement Tuesday.

Meanwhile, it noted that it is "working intensely" to find a technical solution to removing the software without reducing the performance of affected VW products. A total of 488,000 VW and

Audi brand vehicles equipped with four-cylinder engines were recalled Friday, while the automaker ordered dealers to stop selling products equipped with those diesels.

Concerns about the mounting costs and potential impact to VW's reputation have led to a panic among the company's investors. On Monday, the value of VW shares plunged by 17 percent, and the sell-off was continuing midday Tuesday on the German exchange.

The crisis could lead to a shake-up in management at Volkswagen AG, industry analysts have warned.

The U.S. Environmental Protection Administration announced Friday that the automaker had surreptitiously equipped its diesel vehicles with software designed to recognize when those products were being tested on a dynamometer, essentially an automotive treadmill. In such a situation, the full complement of emissions controls systems would operate at their maximum, bringing the vehicles into compliance with U.S. - and even tougher California - emissions standards.

But once the testing would be completed, according to the EPA, the vehicles would revert to a different mode, effectively allowing emissions levels to increase by as much as 40 times.

In its new statement, VW gave more details, admitting that "discrepancies" related to vehicles with Type EA 189 engines and involved some 11 million vehicles worldwide.

"A noticeable deviation between bench test results and actual road use was established solely for this type of engine," the VW statement said. "Volkswagen is working intensely to eliminate these deviations through technical measures."

While the maker acknowledged the computer control systems on 11 million vehicles contain the code, it also claimed that the "majority of these engines the software does not have any effect."

The U.S. has the world's toughest diesel emissions standards, largely focusing on levels of micro-fine particulates and smog-causing oxides of nitrogen. In Europe, where the emphasis is on global warming gases like CO2, diesels handily meet test standards because they are so energy efficient.

Even so, there are mounting calls in Europe for a full investigation of the VW diesel test scandal, and CEO Martin Winterkorn has told Germany's transit ministry the company will fully cooperate with its investigation. Officials in South Korea also have called for an investigation.

Meanwhile, the U.S. Justice Department has reportedly taken the preliminary steps to open a criminal investigation.

Whether the $7.3 billion set aside is enough to cover VW's costs from the scandal remains to be seen. According to EPA rules, VW could be fined up to $37,500 for each vehicle not in compliance with emissions regulations, or a total of around $18 billion. California regulators could issue their own fines.

Several law firms also have taken initial steps of their own to bring class action lawsuits against Volkswagen on behalf of owners.

But perhaps the biggest question concerns the impact the scandal will have on VW's image and sales. The maker overtook Toyota to become the world's best-selling automaker during the first half of 2015. But it has been struggling to build momentum in the critical American market where about a quarter of its sales are diesel-powered vehicles. For now, VW has halted the sale of those models until it can come up with a fix for the faulty software.

Volkswagen probed by states over pollution cheating

Christie Smythe, Bloomberg News

Several states have begun an investigation into Volkswagen's admission that it equipped cars with technology to cheat federal air pollution tests, joining federal investigators and a growing list of countries probing the German automaker.

Wolfsburg, Germany-based Volkswagen said on Sept. 18 that it used "defeat device" software to beat emissions tests in labs. The diesel vehicles spewed as much as 40 times the legal limit of pollutants when they were on the road, the Environmental Protection Agency alleges. Volkswagen said it's cooperating with U.S. officials.

The matter may cost Volkswagen $18 billion in penalties from the EPA, based on a maximum $37,500 violation for each of nearly a half-million diesel versions of the VW Jetta, Golf, Beetle and Passat and the Audi A3.

Matt Mittenthal, a spokesman for New York Attorney General Eric Schneiderman, said in an e-mail today that he could confirm New York is part of the multistate group but was unable to say what other states were part of the probe.

The U.S. Justice Department has also begun a criminal probe, according to officials who spoke on a condition of anonymity.

The German government opened its own probe on Tuesday. Environment Canada also started an investigation, promising unspecified "enforcement action" if the car maker cheated in that country.

NY Times:

http://www.nytimes.com/2015/09/23/business/dealbook/volkswagen-debacle-on-financial-par-with-bp-oil-spill.html

Volkswagen Debacle on Financial Par With BP Oil Spill

SEPT. 22, 2015

By ANTONY CURRIE and OLAF STORBECK

— Volkswagen's cheating on clean air rules in the United States has driven investors into a deep funk.

The German carmaker's market capitalization shrank 16.6 billion euros, or $18.6 billion, in just over a day, after it was caught falsifying emissions on certain cars sold in the United States. The eventual cost could be higher. Although other carmakers have paid less for misdeeds, the better analogy might be oil: BP's 2010 Deepwater Horizon fiasco.

Rival carmakers got off relatively lightly for recent transgressions in the United States with more disastrous immediate consequences. General Motors paid $900 million to settle a lawsuit over faulty ignition switches linked to 124 deaths. Toyota paid $1.2 billion last year for malfunctioning accelerators tied to fewer fatalities.

No deaths can be directly pinpointed to Volkswagen blocking accurate checks on emissions – though the software installed in some vehicles hid levels of harmful nitrogen oxide up to 40 times above permitted levels.

The environmental twist perhaps makes BP's disastrous Gulf of Mexico oil spill a better comparison. Initial total cost estimates by analysts were as low as $3.5 billion. The final bill under the Clean Water Act was $5.5 billion, less than half the maximum fine. But BP's other costs, including damages, ballooned. All in, BP ended up setting aside almost $55 billion in fines, compensation and cleanup costs.

The Clean Air Act allows the Environmental Protection Agency to charge up to $37,500 a vehicle for any breaches. With 482,000 affected cars, that's $18 billion. The E.P.A. could be kinder than that, but Volkswagen, run by Martin Winterkorn, cheated government tests for six years, dissembled when confronted and meanwhile lauded Volkswagen's status as an environmentally sustainable carmaker.

Volkswagen can pay $18 billion, over time, and retain its credit rating. It has €21 billion in net cash, with more coming from planned divestitures.

That, though, doesn't factor in other costs, including recalls, refits, vehicle buybacks and class-action lawsuits – or the possibility that Volkswagen's emissions shenanigans were more pervasive. Diesel cars account for more than half its sales in Europe, its largest market, though with more lenient nitrogen oxide standards. If the scandal undermines the business case for Volkswagen's diesel engines, a €16.6 billion drop in value will look like a country jaunt.

Washington Post:

http://www.washingtonpost.com/news/wonkblog/wp/2015/09/22/anatomy-of-volkswagons-deception-the-recall-that-never-fixed-any-cars/

Anatomy of Volkswagen's deception: The recall that never fixed any cars.

By Peter Whoriskey and Joby Warrick September 22 at 12:20 PM

Volkswagen's decision to equip 11 million vehicles with devices to cheat emissions tests worldwide has sent the company into an acute corporate crisis in recent days. But on December 2, 2014, the company assured U.S. and California regulators that their engineers had a straightforward solution.

Volkswagen told officials then that a software change would remedy the overflow of pollution emitted by their diesel cars, according to state and federal letters to the company. At the time, Volkswagen proposed a "voluntary recall" of about 500,000 vehicles. State and federal officials approved the plan.

That fix was either a technical failure or, some officials said, another ruse.

By May of this year, California tests showed that "the recall calibration did reduce emissions to some degree but NOx emissions were still significantly higher than expected."

The extent of the recall, which is discussed in letters between government and company officials, is unknown. Company officials wouldn't say this week how many recall notification letters Volkswagen issued to consumers, and how many consumers brought their cars in for the purported fix.

But the incident is one of the highlights in what federal and state officials have likened to a cat-and-mouse game between regulators and one of the world's largest automakers.

"They basically ran out of excuses," said Stanley Young, spokesperson for the California Air Resources Board. "They would say the tests weren't at the right temperature, or some other issue. We had them in [to our offices] several times."

EPA administrator Gina McCarthy said on Tuesday that the agency would step up efforts to look for cheating by other manufacturers, though she suggested that Volkswagen was an "outlier" in the extent of its cheating to defeat emissions standards.

"We are not going to sit down around and worry about whether or not there are other devices. We're going to find it," she said. "So right now we're upping our game in terms of going out and doing the work to take a look at what we need to do with other vehicles."

The company's dire diesel troubles have erupted over just a few days, but they were a long time in gestation.

The regulations that shaped the design of the diesel engines were put in place more than 15 years ago, when the EPA finalized rules that raised the emission standards for diesel cars.

After a years-long grace period, the tough standards were phased in between 2004 and 2007. At the time, the government acknowledged that meeting the standards for NOx, or nitrogen oxide, as well as soot, would be difficult.

"Manufacturers have expressed concerns that diesel-fueled vehicles would have difficulty meeting NOx and particulate matter levels like those contained in today's rule," EPA officials wrote in issuing the new standards. "Clearly, these standards will be challenging."

For a time, Volkswagen and other automakers stepped back from the U.S. diesel car market. It was a time to retool. Experts said the challenge of making a diesel engine clean enough for the U.S. standards - without compromising how the engine works - is very difficult.

"NOx is more of a challenge for diesel engines than it is for gasoline engines," said John Storey, distinguished research and development staff member at Oak Ridge National Laboratory. "The strategies companies use to clean them up all have an impact on performance, fuel economy and maintenance."

The engineering hurdles in controlling diesel emissions are high enough, some experts said, that they may provide an incentive for companies to skirt the rules.

"I can't say I'm surprised," John M. DeCicco, Ph.D. Research Professor at the University of Michigan Energy Institute, of the recent revelations. "The temptation to game the system with a defeat device is definitely high because of the technical challenges."

In 2008, Volkswagen came back with a diesel version of the Jetta. The company touted it as an example of the "clean diesel." It won raves, including "Green Car of the Year" at the Los Angeles Auto Show.

"After a three-year break that seemed interminable to fans, Volkswagen's back in the U.S. diesel-car market with a clean-burning diesel in its popular Jetta compact sedan," USA Today told readers.

But what seemed like a breakthrough seems now, in the light of recent revelations, like a massive cheat.

The company's two-liter diesel engines in the U.S. had been equipped with a "defeat device" that allowed the cars to pass federal emissions tests despite emitting more than 10 times the permitted amounts of NOx when it is on the road. Those emissions help produce smog on hot summer days, triggering a variety of health problems, particularly for asthmatics and other people with breathing difficulties.

As has been widely reported, the emission problems were detected in a May 2014 report by the

International Council on Clean Transportation and West Virginia University.

The results were presented to the company and several months later, in December 2014, the company told California regulators that they had a fix. They would "recalibrate" the software that runs the engine.

"Based on this meeting, VW initiated a voluntary recall...This recall was claimed to have fixed among other things, the increased real world driving NOx issue," according to a recent letter from the California Air Resources Board to the company.

By May of this year, California officials had run road tests on cars altered as under the recall. Despite the fix, the car showed higher than expected NOx emissions. California engineers also created a special dynamometer test, apparently to address company concerns that the previous testing was unfair.

California Air Resources Board "has determined that the previous recall did not address the high on-road NOx emissions, and also resulted in the vehicle failing certification standards," it told the company earlier this month.

McCarthy, speaking to reporters in Washington, acknowledged that the Volkswagen software ruse was "particularly difficult for us to detect. We haven't found similar types before but we'll take a look and make sure we're attacking it successfully," she said.

McCarthy defended the EPA's regulatory standards as reasonable, and said most other car manufacturers appear to have found a way to comply.

"This is about a NOX emission standard that was put in place a few decades ago. The industry knew what was happening. We feel pretty confident the industry has been innovating to be able to meet this standard," she said. "So we don't think that this problem with the standards at all."

McCarthy said she was gratified by Volkswagen's aggressive response in acknowledging its mistakes, even as she criticized the company for its years of deliberate deception.

"I think it will be very difficult for Volkswagen at this going to be looked at as anything other than a real outlier," she said.

How VW's 'defeat device' cheated on EPA emissions tests

Clive Cookson, Science Editor

The "defeat device" that Volkswagen used to cheat on US emissions testing sounds as if a secret little black box was hidden deep in the diesel engine just waiting to switch anti-pollution controls on during government inspections.

During normal driving, these controls are relaxed, which improves performance and reduces engine wear.

"The test cycles are very formal and well established, so priming a vehicle to sense when it is

being tested is potentially quite straightforward," said Professor Alastair Lewis, an air pollution expert at York University in the UK. "For example are only its drive wheels turning, is the acceleration unnaturally smooth, or constant speeds too precise for a human driver?"

Modern "clean diesel" engines aim to reduce pollution in a series of computer-controlled steps. For example, the computer may adjust the ratio of air to fuel in the combustion chamber, change the operating temperature or alter the rate at which exhaust gases flow through catalytic converters and filters.

Another refinement is to inject a chemical called urea into the exhaust stream. It then reacts with polluting nitrogen oxides (NOx) and converts them into harmless nitrogen and water.

"A huge amount of complex electronics controls it all," said Roger Kemp, professor of engineering at Lancaster University. "The code in the software gives thousands of different usage patterns corresponding to different combinations of inputs.

"There is a trade-off between pollution control and engine performance," Prof Kemp added. For example running at a hotter temperature may cut emissions but reduce engine life.

Bosch, the German car parts company, supplies components to VW, including fuel injection and exhaust treatment systems that reduce emissions. But people familiar with the cars said VW writes the software that deploys the equipment.

According to the EPA's notice of violation, the software ran the engine with "dyno calibration" settings designed to minimise pollution when it detected testing in progress (dyno refers to dynamometer equipment at the test centre). For the rest of the time it ran on "road calibration" which puts less emphasis on reducing emissions.

Even when the software switches to road running, a modern diesel engine is much less polluting than its filthy predecessors, Prof Kemp pointed out. Its filters and combustion chamber are particularly effective at cutting emissions of the tiny soot particles that used to belch out of ill-tuned engines (and still do in parts of the developing world).

The EPA allegations focus on NOx, reactive gases that are one of the main sources of urban smog and lung-irritating ozone pollution. The violation came to light when researchers at West Virginia University tracked emissions from VW diesel cars on the road and found that NOx soared to levels 10 to 40 times higher than the EPA permits.

Many air pollution experts have long believed that other manufacturers operate their own versions of VW's defeat devices.

"Virtually all new vehicles in recent years appear to emit substantially more NOx in the real-world than they do when tested in labs, irrespective of manufacturer," said Prof Lewis. "VW appear to have been caught red-handed, but it would seem highly likely that others have also played dubious games to pass emissions tests."

Ian Colbeck, professor of aerosol science at the University of Essex, commented: "It has been observed for some time that real world driving conditions do not deliver the emission reductions shown in the laboratory. The European Commission will require real world tests in 2017."

Volkswagen emission scandal widens: 11 million cars affected

Nathan Bomey

Investors crush Volkswagen shares as company sets aside $7.3 billion to address software that manipulates emissions tests.

Volkswagen's emissions scandal ballooned Tuesday as the automaker said it affects 11 million vehicles worldwide and will require the company to set aside 6.5 billion euro ($7.3 billion).

The startling admission instantly makes the crisis one of the most expensive automotive scandals in recent memory.

The crisis also threatens to upend the company on its rapid path to becoming the world's largest automaker. Volkswagen had seized the title from Toyota for the first six months of 2015.

"This could damage the Volkswagen brand globally for years to come," said former automotive marketing executive Peter De Lorenzo, blogger at Autoextremist.com, in an interview. "Trust and belief in the brand has been broken."

Volkswagen CEO Martin Winterkorn pledged to regain the public's trust and rectify the company's mistakes, amid speculation that he could lose his job over the crisis. Winterkorn's contract, coincidentally, is up for renewal at the automaker's board meeting Friday.

In a video statement Tuesday he said he's "endlessly sorry" for the situation but pledged to stay on the job, according to several reports translating the German remarks.

Investors crushed the Germans automaker's stock, driving shares down 18% as of 9:47 a.m. ET, a day after the stock plunged 19%.

The crisis began Friday when the U.S. Environmental Protection Agency accused Volkswagen of installing sophisticated software on nearly 500,000 U.S. vehicles to manipulate emissions tests.

The technology tricks regulators into believing that 4-cylinder diesel vehicles comply with

emissions standards, but the cars are actually admitting harmful pollutants at rates of up to 40 times acceptable standards. Volkswagen quickly halted sales of the cars after the allegations surfaced.

The U.S. Justice Department has opened a criminal probe into the automaker's actions. The EPA's own investigation is ongoing, and foreign regulators are expected to launch their own probes.

"Volkswagen is working at full speed to clarify irregularities concerning a particular software used in diesel engines," the company said Tuesday in a statement.

The "discrepancies" affect vehicles with what it called "Type EA 189 engines," causing "a notable deviation between bench test results and actual road use."

The company added: "Volkswagen is working intensely to eliminate these deviations through technical measures."

Volkswagen said it would set aside 6.5 billion euro in its third quarter to address the matter and warned that the number could change.

In the U.S., the EPA could fine Volkswagen up to $37,500 per car, which would equal a maximum fine of some $18 billion.

"Volkswagen does not tolerate any kind of violation of laws whatsoever. It is and remains the top priority of the Board of Management to win back lost trust and to avert damage to our customers," the company said.

The scandal raises serious questions about whether high-level executives knew about the software, which had been installed on some nameplates for at least six consecutive model years.

Earlier this month a subcommittee of Volkswagen's board recommended that the full panel extend Winterkorn's contract through 2018. The official renewal at Friday's board meeting was viewed as a routine matter, but now it may be up in the air.

Winterkorn kept his job earlier this year after then-chairman Ferdinand Piech tried to displace him. Piech exited the company shortly after his failed effort.

De Lorenzo, the automotive marketing veteran, said Winterkorn will be forced to answer questions about his knowledge of the emissions scandal.

"He's very much detailed-oriented. He's always regaled his underlings with his depth of knowledge of detailed items that they would assume he wouldn't bother with," De Lorenzo said. "I think heads will roll and this could bring down Winterkorn and some of his trusted lieutenants."

Dave Sullivan, an analyst with AutoPacific, said the "chances of him coming out unscathed have got to be very small."

The EPA has said the company admitted to installing the software. The agency said the software affected the four-cylinder diesel versions of the 2009 to 2015 Jetta, Beetle, Golf, the 2014 and 2015 Passat and the 2009 to 2015 Audi A3.

The episode is likely to trigger a recall and a flurry of consumer lawsuits. It may prompt the company to compensate individual car owners or other measures.

European regulators are expected to place Volkswagen under intense scrutiny. But it scandal also could bode poorly for Volkswagen in the world's largest vehicle market, China, where Volkswagen is No. 1 by market share.

"The problem is the Chinese are starting to realize they have got to do something with their air and this could have an effect on the relationship the Chinese have with Volkswagen," Sullivan said.

The Environmental Protection Agency is working on new tests to detect cheating on the part of automakers in the wake of Volkswagen AG's massive cheating scandal.

EPA Administrator Gina McCarthy told reporters at a Wall Street Journal forum on Tuesday that the agency won't sit still and is "upping its game" to catch cheaters.

VW was able to evade U.S. emissions requirements for 482,000 2009-2015 diesel cars by using sophisticated software that only turned on emissions equipment during testing. It's not clear if VW did that to boost low-end torque, raise fuel efficiency or avoid more costly emissions requirements.

The fact that VW was able to get away with the cheating for nearly seven years suggests the agency must take new steps to detect bad behavior, analysts say. Cars are very sophisticated machines with more than 100 million lines of code.

The VW emissions issue came to the attention of the EPA in 2014 after independent analysis by researchers at West Virginia University — working with the International Council on Clean Transportation, a non-governmental organization — raised questions about emissions levels. After extensive testing, EPA confirmed that the vehicles were emitting up to 40 times the allowable pollution in road use.

The EPA told The Detroit News on Friday that it was investigating whether other automakers had similar problems. But McCarthy said so far it appears VW is an "outlier."

This will not be the first time in recent years that EPA has had to change its rules to ensure companies are complying with emissions.

In February, the EPA issued new guidelines to automakers for conducting fuel economy testing. The move came after five major automakers have had to restate mileage ratings for certain models.

The guidelines detail how vehicles must be prepared before being tested — including what is an acceptable level of wear on the tires and how vehicles should be broken in prior to testing.

Also at issue are tests used to determine the impact of aerodynamic drag and tire rolling resistance on gas mileage. Currently, that is measured at 50 miles per hour. Under the new guidelines, automakers must measure the results at all speeds up to 70 mph.

In 2014, the agency said it was considering writing new formal regulations covering mileage labeling by automakers. Instead, it is opting to issue the guidelines. It typically takes EPA two to three years to write new legal binding mandates.

Chris Grundler, the EPA's director of the Office of Transportation and Air Quality, said in an interview in February that "it's a very dynamic time" in the auto industry, and the agency doesn't want to spend several years crafting rules that could be outdated when issued.

"Writing regulations takes time," Grundler said. "When you are working in the rapidly changing environment that we're in right now, we want to make sure that we are agile enough and flexible enough to change with those times."

He said new guidelines are aimed at getting better results. He noted that the EPA will follow the guidelines when it conducts audits of automaker testing.

In November, Korean automakers Hyundai Motor Co. and Kia Motors Corp. agreed to a record-setting $360 million settlement for overstating fuel economy ratings for 1.2 million 2011-13 U.S. vehicles. The settlement includes a $100 million civil penalty, forfeiting $210 million in greenhouse gas emission credits and spending $50 million to ensure independent auditing of its

current and future vehicles.

After an investigation by the EPA, Hyundai and Kia in November 2012 agreed to restate expected gas mileage for 1.1 million vehicles in North America, including 900,000 in the United States. That reduced Hyundai-Kia's fleetwide average fuel economy from 27 to 26 mpg for the 2012 model year. Hyundai was forced to abandon claims that four models got 40 mpg.

In August 2013, Ford Motor Co. dropped mileage ratings for the 2013 C-Max hybrid from a combined 47 mpg to 43 mpg. In June 2014, Ford Motor Co. said it is lowering the fuel ratings on six new cars and would make payments of $125 to $1,050 to more than 200,000 owners.

The move was a significant embarrassment to Ford, which has emphasized the fuel efficiency of vehicles in its lineup. It was he second time in a year that Ford has had to correct its mileage numbers.

Under current rules, Ford was able to assign the same fuel efficiency rating to the C-Max as the Fusion hybrid because they're in the same family. While that's worked for conventional cars, it hasn't been as accurate for hybrids.

Other German automakers besides VW have faced EPA scrutiny. In October, BMW AG agreed to reduce its fuel economy ratings on four 2014 Mini Cooper models.

BMW reduced the combined fuel economy of the three-door manual transmission to 33 miles per gallon from 34 mpg, the three-door semi-automatic from 33 to 32, the Cooper S 3-door manual from 29 to 28 and the semi-automatic version from 31 to 30. The biggest fall is in the highway rating for the Cooper S 3-door manual will fall from 38 to 34 mpg.

Also last year, another Daimler AG agreed to lower the mpg ratings on two of its Mercedes-Benz vehicles after a government audit turned up a problem.

Mercedes-Benz made minor changes to two models. It will reduce the city mpg figure for the 2013-14 C300 to 19 mpg from 20 mpg, but the combined 22 mpg and 27 mpg highway value will remain the same. For the 2013-14 4-Matic PZEV the combined mpg fell to 22 mpg from 23 mpg, while the city and highway mpg figures both fell by 1 mpg to 19 and 28, respectively.

VW CEO: 'Endlessly sorry' as emissions scandal escalates

By Geir Moulson and Pan Pylas | AP September 22 at 11:32 AM

BERLIN — The crisis enveloping Volkswagen AG, the world's top-selling carmaker, escalated Tuesday as the company issued a profit warning following a stunning admission that some 11 million of its diesel vehicles worldwide were fitted with software at the center of a U.S. emissions scandal.

The German company said it was setting aside around 6.5 billion euros ($7.3 billion) to cover the fallout from the scandal that has tarnished VW's reputation, raised questions over the future of CEO Martin Winterkorn and battered its share price.

Winterkorn pledged a fast and thorough investigation.

"Millions of people across the world trust our brands, our cars and our technologies," he said in a video message. "I am endlessly sorry that we have disappointed this trust. I apologize in every way to our customers, to authorities and the whole public for the wrongdoing."

"We are asking, I am asking for your trust on our way forward," he said. "We will clear this up."

The VW Logo is photographed at a car at the Car Show in Frankfurt, Germany, Tuesday, Sept. 22, 2015. Volkswagen has admitted that it intentionally installed software programmed to switch engines to a cleaner mode during official emissions testing. The software then switches off again, enabling cars to drive more powerfully on the road while emitting as much as 40 times the legal pollution limit. (Michael Probst/Associated Press)

The damage to Volkswagen's reputation is reflected in the market's response. Volkswagen's share price slid a further 16.2 percent Tuesday to a near four-year low of 112 euros. The fall comes on top of Monday's 17 percent decline.

The trigger to the company's market woes was last Friday's revelation from the U.S.'s Environmental Protection Agency that VW rigged nearly half a million cars to defeat U.S. smog tests.

The company told U.S. regulators that it intentionally installed software programmed to switch engines to a cleaner mode during official emissions testing. The software then switches off again, enabling cars to drive more powerfully on the road while emitting as much as 40 times the legal pollution limit.

"In my German words: we have totally screwed up," the head of Volkswagen's U.S. division, Michael Horn, told an audience in New York on Monday.

In a statement Tuesday, Volkswagen gave more details, admitting that there were "discrepancies" related to vehicles with Type EA 189 engines and involving some 11 million vehicles worldwide. The number of vehicles involved is more than the 10 million or so cars it sold in 2014.

Volkswagen said it is "working intensely" to solve the problem and that it "does not tolerate any kind of violation of laws whatsoever."

To cover the necessary service measures and what Volkswagen says are "other efforts to win back the trust" of customers, the company said it is setting aside some 6.5 billion euros in the current quarter. There was no mention of fines or penalties in the company's statement. The EPA has indicated that it could, in theory, fine VW up to $18 billion.

The Guardian:

http://www.theguardian.com/business/2015/sep/22/vw-scandal-caused-nearly-1m-tonnes-of-extra-pollution-analysis-shows

VW scandal caused nearly 1m tonnes of extra pollution, analysis shows

Emissions could have far greater impact in Europe, where almost half passenger cars are diesel, than the US

Karl Mathiesen and Arthur Neslen

Volkswagen's rigging of emissions tests for 11m cars means they may be responsible for nearly a million tonnes of air pollution every year, roughly the same as the UK's combined emissions for all power stations, vehicles, industry and agriculture.

The carmaker has recalled 482,000 VW and Audi brand cars in the US after the Environmental Protection Agency (EPA) found models with Type EA 189 engines had been fitted with a device designed to reduce emissions of nitrous oxides (NOx) under testing conditions.

A Guardian analysis found those US vehicles would have spewed between 10,392 and 41,571

tonnes of toxic gas into the air each year, if they had covered the average annual US mileage. If they had complied with EPA standards, they would have emitted just 1,039 tonnes of NOx each year in total.

On Tuesday the company admitted the device may have been fitted to 11 million of its vehicles worldwide. If that proves correct, VW's defective vehicles could be responsible for between 237,161 and 948,691 tonnes of NOx emissions each year, 10-40 times the pollution standard for new models in the US. Western Europe's biggest power station, Drax in the UK, emits 39,000 tonnes of NOx each year.

In the US, just 3% of passenger cars are diesel compared to almost half in the EU. Professor Martin Williams from King's College London said the US's low percentage of diesel cars meant higher diesel emissions in some cars would have a "limited effect" on air quality there.

"[In the US it would be] nowhere near the effect it would have in this country and in the rest of Europe for that matter," he said. In the UK, Williams added, emissions from diesel cars cause roughly 5,800 premature deaths each year. "If you were to make the cars emit at the legal limit you could reduce those deaths by at least a factor of two and maybe more. Maybe a factor of five."

The Clean Air in London campaign called for a royal commission to investigate carmaker's activities in the UK.

"Diesel is without doubt the biggest public health catastrophe in UK history. Even the black plague didn't affect everyone in the population," said founder Simon Birkett.

Not all NOx emissions – which include nitrogen dioxide (NO2) and nitrogen oxide (NO) – are dangerous. But an increasing proportion of the toxic NO2 gas has been detected in EU diesel emissions. A study in the British Medical Journal in May found that short term exposure to NO2 increased the number of premature deaths from heart and lung disease by 0.88% and 1.09%.

For years, UK air pollution measurements have failed to show improvements in air quality, even

as standards have tightened.

"Since 2003 scientists have been saying things are not right. It's not just the VW story, this is part of something much bigger," said Dr Gary Fuller, also of King's College. "It has a serious public health impact."

Last week, a report from NGO Transport & Environment found that Europe's testing regime was allowing nine out of every 10 new diesel vehicles to breach EU limits. Testing regimes in the EU are known to fail to pick up "real world" emissions because cars are not driven in the same way in the laboratory as on the road. Some studies suggest the discrepancy may be up to seven times the legal limit.

Williams said being able to mask their NOx emissions would also enable carmakers to pass carbon emissions tests more easily as there was a trade-off between NOx and CO2 in diesel engines.

Catherine Bearder MEP, a lead negotiator on the EU's new air quality laws, said:
"Manufacturers in the US have been caught out, but we know that pollution limits are also being breached in Europe... Unless we take action, thousands of lives will continue to be tragically cut short by air pollution."

In a sign that the emissions scandal will not remain restricted to the US, a Venice court will next month hear a case against VW and Fiat for misleading test advertising.

The Italian consumer rights group Altroconsumo is due to press its case for a class action suit against VW and Fiat on 2 October, after laboratory tests showed that fuel consumption and CO2 emissions from the VW Golf 1.6 and Fiat Panda 1.2 were up to 50% higher than claimed.

Altroconsumo wants the German car firm to pay damages of €502 (£365) to the owner of a VW Golf, in a case that raises the possibility of widescale compensation payouts by the car industry.

Monique Goyens, the director of the European consumer rights umbrella group BEUC, which includes Altroconsumo, called for an investigation by the European Commission into the use of software programmes to 'game' European emissions tests.

"The VW scandal has compounded our concern that underhand tactics are also being used in fuel consumption and CO2 testing programmes in Europe," she said. "One of the problems in the EU, unlike in the US, is the absence of a market surveillance system which would require independent in-use conformity testing. The EU needs to implement such a system to restore trust amongst consumers."

On Tuesday, the Italian government launched an investigation into VW's emissions testing regime.

Wired:

http://www.wired.com/2015/09/vw-fool-epa-couldnt-trick-chemistry/

VW Could Fool the EPA, But It Couldn't Trick Chemistry

Eric Niiler

FOR DECADES, AUTOMAKERS HAVE been caught between building an engine that squeezes a lot of energy out of the fuel it burns and one that has low emissions. It's not an easy tension to resolve. "Negotiating both fuel consumption and emissions is a hard tradeoff," says Anna Stefanopolou, professor of mechanical engineering at the University of Michigan.

When engineers at Volkswagen allegedly inserted a few lines of code into the diesel cars' electronic brains to circumvent emissions testing, they found a solution to this existential automotive conflict. Drivers got low emissions during the test, and high performance the rest of the time. The only problem: It's way outside of the rules. The company might have gotten away with it, too, if it hadn't been for those pesky engineers—and the basic chemistry of the diesel

engine.

According to the US EPA, those lines of code hid the fact that nearly half a million diesel VWs in the US spewed up to 40 times more nitrogen oxide from their tailpipes than testing indicated. Volkswagen has now confirmed that the problem actually affects approximately 11 million diesel cars worldwide. Diesel engines use a different mix of fuel than gasoline engines and don't use spark plugs to induce combustion—relying instead on highly compressed, heated air and fuel injected as droplets. If a diesel engine doesn't get enough oxygen to combust the fuel, it'll emit all kinds of gunk—nitrogen oxides, uncombusted fuel, and particulate matter (soot, basically).

All that gunk is a big problem. Exposed to sunlight, nitrogen oxides convert to ozone—making smog. How much depends on a bunch of variables, like sunlight exposure and what happens to the hydrocarbon emissions (the uncombusted fuel), plus the temperature and local winds.

However much extra crap came from the VWs, it won't be good. Exposure to nitrogen oxide and ozone is linked to increased asthma attacks, respiratory illnesses, and in some cases premature death. Ozone also worsens existing cardiovascular and lung disease.

To deal with those emissions, "you have a whole chemical factory at the tailpipe that traps the oxides," Stefanopolou says. This bumps the sticker price for diesel cars by $5,000 to $8,000 per vehicle. (On the other hand, diesels get better mileage, especially in highway driving.)

For years, diesel trucks and buses were the biggest polluters on the highway. But carmakers adapted a relatively new technology called selective catalytic reduction—the same tech that scrubs pollutants from factory smokestacks—to the tailpipe of the diesel engine.

Here's how it works: Inside a honeycombed chamber, the scrubbing system sprays a liquid made of 30 percent urea and 70 percent water into the diesel exhaust. This sets off a chemical reaction that converts nitrogen oxides into nitrogen, oxygen, water and small amounts of carbon dioxide—molecules that aren't as harmful to human health. Catalytic scrubbing was supposed to cut diesel NOx emissions up to 90 percent, according to the Diesel Technology Forum, an industry group based outside Washington. That made diesel engines clean enough to use in passenger cars, which have stricter emissions rules.

The scrubbing chemistry is also what gave away Volkswagen's alleged cover-up. In 2013, a small non-profit group decided to compare diesel emissions from European cars, which are notoriously high, with the US versions of the same vehicles. A team led by Drew Kodjak, executive director of the International Council on Clean Transportation, worked with emissions researchers at West Virginia University to test three four-cylinder 2.0-liter diesel cars in the Los Angeles area: a Jetta, a Passat, and a BMW. Only the BMW passed.

"We felt that it would be possible to get low emissions for diesels," Kodjak said. "You can imagine our surprise when we found two of the three vehicles had significant emissions."

The ICCT reported its findings to the EPA and the California Air Resources Board. Regulators met with VW officials in 2014 and the automaker agreed to fix the problem with a voluntary recall. But in July 2015, CARB did some follow up testing and again the cars failed—the scrubber technology was present, but off most of the time.

How this happened is pretty neat. Michigan's Stefanopolou says computer sensors monitored the steering column. Under normal driving conditions, the column oscillates as the driver negotiates turns. But during emissions testing, the wheels of the car move, but the steering wheel doesn't. That seems to have have been the signal for the "defeat device" to turn the catalytic scrubber up to full power, allowing the car to pass the test.

Stefanopolou believes the emissions testing trick that VW used probably isn't widespread in the automotive industry. Carmakers just don't have many diesels on the road. And now that number may go down even more.

IEEE Spectrum:

http://spectrum.ieee.org/cars-that-think/transportation/advanced-cars/how-professors-caught-vw-cheating

How Engineers at West Virginia University Caught VW Cheating

By Philip E. Ross

Volkswagen, which had just become the biggest-selling automaker in the world, has now been nabbed committing perhaps the biggest corporate cybercrime of all time.

Its diesel cars were found to have cheated systematically on emissions tests run by the United States Environmental Protection Agency (EPA) over the past seven years. When the control system sensed that a test was under way, it would order the engine to ix-nay on the ox-nay—NOx that is, or nitrous oxides—long the bugbear of diesel engines. Later, when the coast was clear, the system would let the NOx pour out at up to 40 times the allowed levels in order to optimize fuel economy.

This dirty trick allowed for a clean getaway for some 482,000 cars under the VW and Audi brand names, including the VW Jetta and the Audi A3. The EPA found out, VW admitted wrongdoing, and it stopped selling the offending vehicles. Its shares lost more than 0ne-fifth of their value in the early hours of the next trading day.

But the guys who found the clues to the crime say they weren't looking for trouble—they were just working under contract to a clean-transportation group that wanted to convince European regulators to adopt stricter emissions standards, as the United States has done.

"We had no cause for suspicion; we thought the vehicles would be clean," John German, of the International Council on Clean Transportation, told Bloomberg news.

The ICCT subcontracted the testing to the University of West Virginia's Center for Alternative Fuels, Engines and Emissions (CAFEE). Its engineers compared emissions measured on a road trip to results from the same cars that their colleagues were getting in the lab. The discrepancies were great.

Dan Corder, head of WVU's Center for Alternative Fuels, Engines, and Emissions (CAFEE)

Some people have mischaracterized what our role was," says Dan Corder, who heads up CAFEE. "Some have used the phrase 'tipped off the EPA.' We didn't."

The engineers from CAFEE reported on these preliminary results in spring of 2014 at the Coordinating Research Council's Real-World Emissions Workshop, which was held in San Diego that year. Corder hastens to add that the results, based as they were on a handful of cars, were preliminary and that they researchers drew no conclusions. According to Corder:

We said, these are two vehicles. We're presenting what we can present. EPA people were in the audience. And the ICCT publicized the results on its website, then delivered them to the EU's Joint Research Center.

http://www.nytimes.com/2015/09/23/business/international/volkswagen-diesel-car-scandal.html

Volkswagen Says 11 Million Cars Worldwide Are Affected in Diesel Deception

By JACK EWING SEPT. 22, 2015

FRANKFURT — A scandal that has undermined Volkswagen in the United States spread to its core market of Europe on Tuesday, after the company said that 11 million of its diesel cars worldwide were equipped with software that was used to cheat on emissions tests.

Volkswagen did not provide information on where the affected cars are, but the overwhelming majority are probably in Europe, where the company dominates the market and accounts for more than one of every four cars sold.

The German automaker said it was setting aside the equivalent of half a year's profits — 6.5 billion euros, or about $7.3 billion — to cover the cost of fixing the cars to comply with pollution standards and to cover other expenses, which are likely to include fines as well as responses to civil lawsuits from angry customers.

The carmaker's statement was its first admission that diesel cars outside the United States may contain the software that led the Environmental Protection Agency to accuse the company of deliberately evading pollution tests. Previously, Volkswagen had acknowledged only that the problem affected about 500,000 vehicles in the United States.

The tampered vehicles use what is known as Type EA 189 engines, which are 2-liter engines. The company said on Tuesday that "a noticeable deviation between bench-test results and actual road use was established" for the engines.

Volkswagen said it would also make "other efforts to win back the trust of our customers."

The number of cars involved suggests that the scale of the damage to Volkswagen's reputation and its financial standing may be even greater than thought.

Volkswagen shares fell by nearly 18 percent through late-afternoon trading in Frankfurt on Tuesday, after falling by 16 percent on Monday.

The diesel cars were programmed to sense when emissions were being tested and to turn on equipment that reduced emissions, according to United States officials. At other times, the cars had better fuel economy and performance, but produced as much as 40 times the allowed amount of nitrogen oxide, a pollutant that can contribute to respiratory problems including asthma, bronchitis and emphysema.

"Volkswagen is working intensely to eliminate these deviations through technical measures," the company said.

It is not clear, though, how fully Volkswagen might be able to correct the problem on the 11 million vehicles. The company could presumably alter the engines, so that the cars on the road begin actually meeting the required emissions standards. But doing so would probably degrade the vehicles' fuel economy and performance, and might cause the engines to wear out sooner.

The E.P.A. has ordered Volkswagen to recall almost a half-million vehicles sold in the United States from 2009 to 2015. The affected Golf, Passat, Jetta and Beetle cars were equipped with 2-liter diesel engines. Some Audi models also use the same diesel engine.

Volkswagen has halted sales of cars with the engines in the United States.

Volkswagen CEO's days appear numbered as emissions crisis deepens

BERLIN | BY ANDREAS CREMER

Martin Winterkorn's days as head of Volkswagen AG appeared numbered on Tuesday after the German carmaker said a scandal over falsified vehicle emission tests in the United States could affect 11 million of its cars worldwide.

The Tagesspiegel newspaper, citing unidentified sources on Volkswagen's supervisory board, said the board would decide on Friday to replace Winterkorn with Matthias Mueller, the head of

the automaker's Porsche sports car business.

A Volkswagen spokesman denied the report. The company later said it would post a video statement by Winterkorn at 1500 GMT. A spokesman for Porsche said Mueller was attending a Volkswagen board meeting at its headquarters in Wolfsburg.

A key Winterkorn ally withheld public support for the under-fire chief executive on Tuesday.

"I don't want to preempt the upcoming intense deliberations and will not comment on details or any consequences," Stephan Weil, head of the German state of Lower Saxony, told reporters in Hanover when asked about Winterkorn's future.

Weil, a supervisory board member representing Volkswagen's second-largest shareholder, earlier this year helped Winterkorn to see off a challenge to his leadership by long-time chairman Ferdinand Piech.

Shares in Europe's biggest carmaker plunged almost 20 percent on Monday after it admitted using software that deceived U.S. regulators measuring toxic emissions in some of its diesel cars.

The stock tumbled another 20 percent to a four-year low on Tuesday after some countries in Europe and Asia said they would launch investigations themselves.

Volkswagen said it would set aside 6.5 billion euros ($7.3 billion) in its third-quarter accounts to help cover the costs of the biggest scandal in its 78-year-history, blowing a hole in analysts' profit forecasts.

It also warned that sum could rise, adding diesel cars with so-called Type EA 189 engines built into about 11 million Volkswagen models worldwide had shown a "noticeable deviation" in emission levels between testing and road use.

Volkswagen sold 10.1 million cars in the whole of 2014.

The U.S. Environmental Protection Agency (EPA) said on Friday Volkswagen could face penalties of up to $18 billion for cheating emissions tests. The carmaker also faces lawsuits and damage to its reputation that could hit sales, while media reports have said the U.S. Department of Justice has opened a criminal inquiry into the matter.

The crisis has sent shockwaves through Germany, with Chancellor Angela Merkel calling for "complete transparency" from a company long seen as a beacon of the country's engineering excellence, and newspapers putting the blame squarely on Winterkorn.

The 68-year-old was due to have his contract extended at a supervisory board meeting on Friday, but is now facing questions over why the scandal wasn't averted.

Volkswagen, which for several years has been airing U.S. TV commercials lauding its "clean diesel" cars, was challenged by authorities as far back as 2014 over tests showing emissions exceeded California state and U.S. federal limits.

The company attributed the excess emissions to "various technical issues" and "unexpected" real-world conditions.

It wasn't until the EPA and the California Air Resources Board threatened to withhold certification for its 2016 diesel models that Volkswagen in early September admitted its wrongdoing.

"Winterkorn either knew of proceedings in the U.S. or it was not reported to him," Evercore ISI analyst Arndt Ellinghorst said. "In the first instance, he must step down immediately. In the second, one needs to ask why such a far-reaching violation was not reported to the top and then things will get tough too."

Porsche's Mueller was promoted to Volkswagen's executive board on March 1 and was previously its head product strategist. As a management board member of family-owned Porsche SE, he is also close to the Porsche-Piech clan that has a controlling shareholding in Volkswagen.

"TOTALLY SCREWED UP"

Winterkorn has built Volkswagen into a global powerhouse since he took the helm in 2007, with brands ranging from budget Seats and Skodas to premium Audis and top-end Porsches and Lamborghinis.

But he has also faced criticism for a centralized management style which some analysts say has hampered the company's efforts to address long-standing underperformance in North America.

Workers in Wolfsburg, where Volkswagen employs over 50,000 people, were dismayed by the damage to the company's image. "If Winterkorn knew of the manipulation, then he must go," said one staffer who works at the plant's human resources department.

LA Times:

http://www.latimes.com/business/autos/la-fi-vw-subsidies-20150922-story.html

U.S. taxpayers duped into shelling out $51 million in green subsidies for 'clean' VW vehicles

By JERRY HIRSCH

The federal government paid out as much as $51 million in green car subsidies for Volkswagen diesel vehicles based on falsified pollution test results, according to a Times analysis of the federal incentives.

On Friday, federal and state regulators said the German automaker used software in 482,000 of its diesel vehicles since the 2009 model year to cheat on U.S. emissions tests. Environmental Protection Agency officials said Monday that the U.S. Department of Justice is also investigating.

The Times analysis matched Internal Revenue Service data with Volkswagen sales figures to determine the value of subsidies VW diesel buyers were eligible to collect in 2009, the first and only year the vehicles qualified. The $1,300 tax credit would have been available to buyers of about 39,500 Jetta and Jetta Sportwagen models that sold that year, according to Motor Intelligence, an industry research firm.

"It is really unfortunate," said Luke Tonachel, director of clean vehicles and fuels project at the Natural Resources Defense Council. "The government has been effective to help advance clean technologies, but it is a waste of taxpayer dollars when they aren't actually helping to clean the environment."

He said regulators should factor in the $51 million in subsidies when determining penalties for Volkswagen's Clean Air Act violations.

Such green car incentives have also gone to buyers of hybrid, electric and hydrogen fuel cell cars. But the EPA does not track aggregate figures for incentives paid out to buyers of specific models or brands.

The Volkswagen diesels qualified for the federal incentives in the same year the automaker first installed the software trick it used to cheat on emissions tests. The so-called defeat device employed an algorithm that automatically detects when the vehicle is undergoing pollution tests and changes the way the engine performs.

The algorithm senses whether the car is in a testing environment by analyzing a variety of data — steering position, speed, duration of engine operation and barometric pressure.

Away from the laboratory, during everyday driving, the cars emit up to 40 times the legally allowed amount of nitrogen oxide, environmental officials said.

The Environmental Protection Agency and the California Air Resources Board discovered the software. The EPA said Monday it will coordinate with federal prosecutors on further enforcement and penalties.

How Volkswagen cheated on emissions rules

Autos editor Brian Thevenot explains how Volkswagen used a software trick to hide illegal pollution levels in half a million diesel cars.

"Determinations regarding potential penalties and other remedies will be assessed as part of the investigation EPA has opened in conjunction with the U.S. Department of Justice," said EPA spokeswoman Liz Purchia.

The Justice Department has lately taken on a leading role in major investigations of automakers, usually leveraging the threat of criminal charges to exact huge fines.

Last week, General Motors agreed to pay a $900-million fine to settle an investigation into why it did not promptly recall cars with a defective ignition switch that has led to crashes causing 124 deaths. Last year Toyota signed a $1.2-billion settlement and admitted to deceiving regulators about deadly safety defects that allegedly caused unintended sudden-acceleration incidents.

No individuals were charged in the GM and Toyota probes.

"This might be the perfect case for Department of Justice to come down on the criminal side against individuals and not just the company," said Carl Tobias, a University of Richmond law professor. "Someone had to do the computer programming. Someone had to OK this, and all in what is known as an autocratic, top-down company."

The German automaker admitted installing the software after it was confronted by regulators. In a statement Sunday, VW Chief Executive Martin Winterkorn said, "I personally am deeply sorry that we have broken the trust of our customers and the public."

Winterkorn said the automaker "will cooperate fully with the responsible agencies, with transparency and urgency, to clearly, openly and completely establish all of the facts of this case."

He said VW has also ordered an external investigation into the matter, pledging to "do everything necessary in order to reverse the damage this has caused."

Volkswagen declined to comment on the Times analysis of its revenue from the federal Alternative Motor Vehicle Credit.

Volkswagen shares fell $33.89, or 18.5%, to close Monday at $149.68.

See the most-read stories this hour >>

This was the second time Volkswagen has been charged with using devices to evade U.S. emission-control rules.

In 1974, the automaker paid a $120,000 fine to settle EPA charges that it gamed pollution control systems in four models by changing carburetor settings and shutting off an emissions-control system at low temperatures. VW didn't admit guilt but pledged management changes to ensure future compliance with EPA regulations.

This time the monetary damage could be much greater.

The automaker will have to recall all the vehicles and modify the emissions systems at its own expense, regulators said. Additionally it could face a fine of as much as $18 billion, or $37,500 per car. And for now it has suspended sales of thousands of new and used diesel models sitting on dealer lots — cars that are depreciating rapidly while the automaker develops a fix for the emissions system.

The affected diesel models are Jetta (model years 2009-15), Beetle (2009-15), Audi A3 (2009-15), Golf (2009-15) and Passat (2012-15).

Volkswagen also will face civil lawsuits on two fronts, including consumer fraud cases and class-action litigation for what is called a "diminished value" lawsuit. The vehicles are likely to lose some of their resale value because of the problem.

The Volkswagen case breaks new ground for how corporations can make "end runs" around legal requirements, said Ryan Calo, a University of Washington professor and expert in robotics and autonomous systems law and policy.

A company, for example, might learn of an inspection at a construction site and then make sure that workers wear helmets or it might clean a food plant thoroughly before a scheduled review even if it doesn't operate that way all the time.

"But this is encoded," Calo said. "I bet that it happens elsewhere but it is rare we detect it because we typically don't go through the code. There could be many examples in everyday things."

The VW issue demonstrates why regulators need more technical expertise, including a federal robotics commission, he said.

"We need experts in a centralized place whether the issues are drones, driverless cars or things like the VW example," Calo said.

EPA is 'Upping its Game' After Volkswagen Allegations

Top administrator is pleased with auto maker's 'aggressive stance' on tackling problem

By JEFFREY SPARSHOTT

Sept. 22, 2015 9:42 a.m. ET

WASHINGTON—The top official at the Environmental Protection Agency said the agency is "upping its game" in the search for possible violations of U.S. pollution rules following allegations that Volkswagen AG circumvented emissions standards.

"We are not going to sit around and worry about whether others have it, we are going to find it," Gina McCarthy said at a Wall Street Journal breakfast Tuesday. "Right now, we are upping our game in terms of going out and doing work to take a look at what we need to do with other

vehicles."

The EPA last week accused Volkswagen of dodging air-pollution rules on nearly half a million cars sold in the U.S. The German company has since halted American sales of the diesel-powered cars at issue and apologized for violating customers' trust.

Volkswagen allegedly used software, dubbed a "defeat device," in the cars to make diesel-powered engines appear to have lower levels of emissions than they actually did. About 482,000 Volkswagen diesel-powered cars sold in the U.S. since 2008 were affected.

Ms. McCarthy said the alleged violation was difficult to detect, but she is "pleased Volkswagen is taking such an aggressive stance on admitting the problem and attacking it."

"I think we have to be concerned whether there are other defeat devices out there that we have not been able to detect," she said. But the auto industry is well aware of the pollution rules and has been working to comply.

"I think it will be very difficult for Volkswagen at this point to be looked at as nothing other than an outlier," Ms. McCarthy said.

Detroit Free Press:

http://www.freep.com/story/news/2015/09/21/us-house-panel-hold-hearing-vw/72583066/

Congress to hold hearing on VW air emissions violation

Todd Spangler and Nathan Bomey, Detroit Free Press and USA Today 8:15 p.m. EDT September 21, 2015

WASHINGTON — Congressional investigators will hold a hearing in the coming weeks to take testimony on allegations raised by the U.S. Environmental Protection Agency that Volkswagen sold hundreds of thousands of diesel-powered vehicles with software to get around air emission limits.

U.S. Rep. Fred Upton, who chairs the House Energy and Commerce Committee, said Monday that the committee's Oversight and Investigations Subcommittee will look into the EPA's allegations, which were first raised Friday. VW's stock value plunged Monday in the aftermath of the revelations, which could affect some 500,000 vehicles and potentially result in fines totaling as much as $18 billion.

Volkswagen's CEO said he was "deeply sorry" for violating U.S. emissions standards and on Sunday ordered an external investigation, two days after the EPA accused the automaker of purposefully manipulating emissions tests for almost 500,000 vehicles.

The German automaker ordered its U.S. dealerships to stop selling cars impacted by the probe until its engineers can deliver a fix.

A date was not set for the congressional hearing but Energy and Commerce staff said it would come within the next several weeks.

“Strong emissions standards are in place for the benefit of public health," Upton, R-St. Joseph, and subcommittee Chairman Tim Murphy, R-Pa., said in a joint statement. “We will follow the facts. We are ... concerned that auto consumers may have been deceived — that what they were purchasing did not come as advertised."

As the Free Press reported Friday, the EPA and the state of California accused VW of violating the Clean Air Act by using software in some 482,000 diesel-powered vehicles that could detect when the car was undergoing official emissions testing and turn full emissions controls on only during the test. The effectiveness of pollution control equipment was reduced otherwise.

EPA's violation notice covered model year 2009-15 Jettas, Beetles, Audi A3s and Golfs and model year 2014-15 Passats.

As a result, Volkswagen had a hand in potentially exposing people to harmful pollutants at levels 40 times the acceptable standard and that could exacerbate respiratory conditions such as asthma, the EPA charges.

"I personally am deeply sorry that we have broken the trust of our customers and the public," Martin Winterkorn, Volkswagen's CEO, said in a statement. "We will cooperate fully with the responsible agencies, with transparency and urgency, to clearly, openly and completely establish all of the facts of this case."

"We do not and will not tolerate violations of any kind of our internal rules or of the law," Winterkorn said. The company's board takes the allegations "very seriously," he said.

The violations could expose Volkswagen — the world's largest vehicle manufacturer through the first six months of 2015 — to up to $18 billion in federal fines if the EPA assesses the maximum possible penalty of $37,500 per vehicle.

The violations could invite charges of false marketing by regulators, a vehicle recall and payment to car owners, either voluntarily or through lawsuits. Volkswagen advertised the cars under the "Clean Diesel" moniker.

The state of California is investigating the emissions violations.

The EPA accused the German automaker of adopting what it called a "defeat device" to trick U.S. regulators into believing its cars met Clean Air Act standards for nitrogen oxides. Volkswagen admitted to investigators it had installed the defeat device, the EPA said.

Volkswagen told dealers they cannot sell the 4-cylinder diesel versions of those cars until a fix is

available, Volkswagen spokesman Mario Guerreiro said Sunday.

The sales halt could put a significant dent in the company's September sales performance. About 20% of Volkswagen's vehicle sales are diesel engines, said AutoPacific analyst Dave Sullivan.

"It totally goes against all of the marketing they have had of a clean diesel," Sullivan said of the violations. "That's one of the biggest selling points for Volkswagen."

"The trust of our customers and the public is and continues to be our most important asset," Winterkorn said Sunday. "We at Volkswagen will do everything that must be done in order to re-establish the trust that so many people have placed in us, and we will do everything necessary in order to reverse the damage this has caused. This matter has first priority for me, personally, and for our entire Board of Management."

Chicago Tribune:

http://www.chicagotribune.com/business/ct-volkswagen-owners-0921-biz-20150921-story.html

Volkswagen owners should be nervous about emissions scandal, experts say

Becky Yerak and Gregory Karp

Volkswagen hit with class-action suit over emissions cheating.

Automobile recalls, even huge, highly publicized ones, typically don't hurt new or used car sales, but the Volkswagen scandal involving tricking emissions testers is different and could be cause for worry among VW diesel vehicle owners, experts say.

At least one class-action lawsuit has already been filed on behalf of Volkswagen and Audi owners. It claims fraud and breach of contract, citing the "diminished value" of the nearly

500,000 recalled diesel vehicles, which usually sell for a premium price over their gasoline counterparts. Specifically, after recalled Volkswagen diesels are fixed, the cars might have degraded horsepower and fuel efficiency, the suit says.

The EPA says Volkswagen violated the federal Clean Air Act by installing "defeat devices" — software programmed to switch engines to a cleaner mode during official emissions testing. The software then switches off again, enabling cars to emit as much as 40 times the legal limit of pollutants during normal driving.

Volkswagen marketed the diesel-powered cars as being better for the environment. The affected diesel cars, according to the EPA's letter to Volkswagen on Friday, include: Jetta, 2009 to 2015; Jetta SportWagen TDI, 2009 to 2014; Beetle, 2012 to 2015; Beetle Convertible, 2013 to 2015; Audi A3, 2010 to 2015; Golf, 2010 to 2015; Golf SportWagen TDI, 2015; and Passat, 2012 to 2015.

Consumer Reports called the Volkswagen scandal "outrageous" and a violation of law.

"Volkswagen was ripping off the consumer and hurting the environment at the same time," said Ellen Bloom, senior director of federal policy for Consumers Union, the policy and advocacy arm of Consumer Reports.

The EPA has ordered VW to fix the cars at its own expense but said car owners do not need to take any immediate action. The EPA insisted that the violations do not pose any safety hazard and said cars on the road remain legal to drive. Volkswagen has ordered a stop to sales of new and used TDI cars in stock.

The EPA said, however, that the cars pose a threat to public health. The agency said the carmaker could be fined more than $18 billion.

The automaker is also part of a criminal probe by the U.S. Justice Department, unnamed sources told The Associated Press and Bloomberg News.

In the Chicago region, Volkswagen dealerships were not responding to inquiries Monday, except one that said it hadn't heard from any consumers about the issue and expressed confidence the problem would be taken care of.

For consumers, whether diesel Volkswagens from seven model years will really have less value is an open question.

During recent high-profile recalls by GM, Toyota and Honda, there has been very little, if any, impact on sales, said officials from Kelley Blue Book, Black Book and Edmunds.

"With so many recalls in the news, they easily become white noise for a lot of consumers, and they don't appear to have much of an influence on shopping decisions," according to Edmunds.com.

Even when there's intense media coverage, the impact on resale value is "fleeting," as with the Toyota recall for accelerators that would stick, said Eric Ibara, a senior analyst with Kelley Blue Book. "It lasted for maybe six or eight months, and their resale values popped back to where they normally were.

Still, the Volkswagen recall is different.

First, it doesn't involve a safety issue but more a breach of public trust. "The impact on that could be longer-lasting," Ibara said. "Our concern is their image is tarnished ... I imagine if you own a Volkswagen, you're reading the coverage of what they've done."

Indeed, when a car is recalled for a safety reason, the recall could actually improve goodwill with the customer, said Anil Goyal, vice president of Automotive Valuation and Analytics for Black Book.

Another concern for current owners is how the resale values will react when Volkswagen eventually restarts selling the diesel models now sitting idle on lots after it stopped selling. "If they show up with higher incentive levels, that certainly impacts the used-car values," Ibara said.

In other words, if VW chooses to get rid of that inventory by offering great incentives and significantly lowering diesel car prices, demand for used cars would drop along with their prices.

Volkswagen offers some of the least expensive diesel models and in recent years had been a market leader in that segment of the vehicle market, said John Voelcker, editor of GreenCarReports.com. "Diesels in this country have mostly been confined to trucks," Voelcker said. "VW was the only volume maker of diesel cars."

According to Edmunds, VW and Audi account for 17 of 44 vehicle models that offer diesel engines, or 39 percent.

Diesel vehicles fetch a premium price both in the new and used markets. The premium price paid by new-car buyers for the diesel version of the recalled cars varies from $1,000 to almost $7,000, according to list prices.

In a quick analysis by Swapalease.com, a 3-year-old base model Volkswagen Golf using gasoline sold for 51 percent of its original value, while a diesel sold for 57 percent, said Scot Hall, executive vice president of operations for Swapalease.com. "That's a significant difference," he said.

It's an open question whether the VW diesels, which have TDI as part of the name for turbocharged direct injection, will retain the premium over their gasoline counterparts, Ibara said. "It would not surprise me if they drop a little bit, but I do not expect the premium to entirely disappear."

What fix Volkswagen will employ is unclear, whether it's a software solution or some physical repair or retrofit. It may just restate the fuel economy to be lower on diesels — maybe 3 to 5 mpg

— and then be faced with offering some compensation to owners, Ibara said.

So far, it's difficult to say for sure that a fix would hurt the vehicle's fuel mileage, performance or reliability. But some current owners are expecting that, Hall said.

Hall said there's talk that some Volkswagen owners would avoid the fix because they prefer more power, better performance and greater fuel economy and care less about the emissions.

Consumer Reports said that, as a result of the scandal, it has suspended its "recommended" rating of two VW vehicles, the Jetta diesel and Passat diesel, until it can retest the cars with the recall repair performed. It said it will also assess whether the repair hurts performance or fuel economy.

The potential downgrade in performance was also mentioned in the class-action lawsuit,

filed on behalf of David Fiol, a California resident and 2012 VW Jetta SportWagen TDI owner. He seeks class-action status both nationally and in California, for unspecified punitive damages and legal fees, among other things.

Fiol, in his lawsuit, mentions "future additional fuel costs" and the "diminished value" of his vehicle, despite the recall.

Volkswagen won't be able to make the vehicles "comply with emissions standards without substantially degrading their performance characteristics, including their horsepower and their efficiency," the lawsuit said. "As a result, even if Volkswagen is able to make" plaintiffs' vehicles EPA compliant, the owners "will nonetheless suffer actual harm and damages because their vehicles will no longer perform as they did when purchased and as advertised."

Volkswagen didn't immediately respond to a request for comment about the lawsuit, filed last Friday by Seattle law firm Hagens Berman Sobol Shapiro in a U.S. District Court in the

Northern District of California.

In Illinois, diesel vehicles like the VWs in question don't require emissions inspections like gasoline models, so the flap won't affect owners in that way, according to a spokeswoman for the Illinois Environmental Protection Agency.

It Took E.P.A. Pressure to Get VW to Admit Fault

By BILL VLASIC and AARON M. KESSLER SEPT. 21, 2015

Volkswagen executives told environmental regulators for more than a year that discrepancies between pollution tests on its diesel cars and the starkly higher levels out on the road were a technical error, not a deliberate attempt to deceive Washington officials.

But this month, the executives made a startling admission: The diesel vehicles it sold in the United States used software meant to cheat on the tests.

VW made the admission only when the Environmental Protection Agency took the extraordinary

action of threatening to withhold approval for the company's 2016 Volkswagen and Audi diesel models, according to letters sent to company officials by the E.P.A. and California regulators.

Since that deception became public on Friday, Volkswagen has scrambled to conduct damage control. The chief executive apologized and the company said it would stop selling diesel-powered cars from the 2015 and 2016 model years.

All this was possible because environmental regulators had tools and powers at their disposal that another area of enforcement — auto safety regulation — does not have, despite the efforts of lawmakers, consumer advocates and, more recently, auto safety regulators themselves. Often, the auto industry has beaten back more stringent laws.

The National Highway Traffic Safety Administration, for example, can impose a maximum penalty of $35 million on an automaker that flouts safety regulations — a relatively low sum for a company like General Motors, which last year paid such a fine for a defect that has now been linked to at least 124 deaths.

By contrast, under the Clean Air Act, Volkswagen, the world's largest automaker, could be fined as much as $37,500 for each recalled vehicle, for a possible total penalty of as much as $18 billion.

"The Clean Air Act statutory scheme gives E.P.A. more power and flexibility to move more quickly than N.H.T.S.A.," said Carl Tobias, a law professor at the University of Richmond, who has studied the government's response to auto safety issues. "E.P.A. also seems more tough-minded and savvy about how to be effective in this arena."

Still, the time it takes to investigate auto companies is often extensive, and getting the facts can be a challenge. "Even E.P.A. took a year to finally crack this case open," he said.

Beyond the E.P.A., the government has other tools at its disposal when it comes to enforcing environmental regulation.

As G.M. did, Volkswagen now faces a criminal investigation by the Justice Department, according to a person briefed on the inquiry. It is being conducted, though, by the department's Environment and Natural Resources Division, which is devoted to violations of environmental law. "Nearly one-half of the division's lawyers bring cases against those who violate the nation's civil and criminal pollution-control laws," the department's website says.

And on Monday, a subcommittee of the House Energy and Commerce Committee said it would hold a hearing on the issue.

It's only part of the pressure being applied to Volkswagen. An official with the Environmental Protection Agency said that discussions are continuing with Volkswagen, as the company grapples with how to handle a recall of the affected vehicles.

"We still have many questions for the company," said Christopher Grundler, head of the agency's transportation office. "It's the responsibility of Volkswagen and Audi to prepare a remedy for these vehicles."

There is no timetable for Volkswagen to submit a comprehensive plan to recall and fix the affected vehicles. But government officials are urging the company to take action quickly — both on developing a fix for the cars and starting a campaign to educate consumers on the problem.

"This does not happen immediately," Mr. Grundler said. "And we've been trying to be clear with the consumers that their vehicles are safe and they don't have to do anything right now." The assessment of fines for the violations will also not happen immediately. "That is down the road," he said.

"But we feel a sense of urgency to address the emissions of these vehicles that are already on the road."

A Volkswagen spokesman, John Schilling, said the automaker was "committed to fixing this issue as soon as possible" and to developing "a remedy that meets emissions standards and satisfies our loyal and valued customers."

Even with the looming punishment, the company almost got away with it. In fact, it most likely would have if not for a strange twist of fate and the curiosity of several auto researchers.

Two years ago, the International Council on Clean Transportation, a nonprofit environmental group staffed by a number of former E.P.A. officials, had been testing the real-world performance of so-called clean diesel cars in Europe, and were less than impressed with the emissions results.

The group decided it would test diesel-powered cars in the United States, where regulations were much more strict, as a way of almost shaming the European automakers to tighten their compliance. The group fully expected the American cars to do well, and run cleaner than their counterparts across the pond.

What they could not have foreseen was that they would stumble onto one of the biggest frauds in recent automotive history.

Further, on the campus of West Virginia University, a group of emissions researchers who mainly dealt with heavy trucks noticed an unusual posting by the transportation council, which was looking for a partner to test diesel-powered cars.

"No one had done that before in the U.S.," said Arvind Thiruvengadam, a professor at the university. "It sounded very interesting, to test light-duty diesel vehicles in real-world conditions. We looked around at each other said, 'Let's do it.' "

The university's team bid on the project and got the contract. Mr. Thiruvengadam and his colleagues never envisioned where it would lead. "We certainly didn't have an aim of catching a manufacturer cheating," he said. "It didn't even cross our minds."

The study also did not target Volkswagen specifically. It was something of a fluke, he said, that two out of three diesel vehicles bought for the testing were VWs.

It did not take long for suspicions to set in. The West Virginia researchers were well-versed in diesel performance on real roads, and had certain expectations for how the test cars should ebb and flow in their emissions. But the two Volkswagens behaved strangely.

"If you're idling in traffic for three hours in L.A. traffic, we know a car is not in its sweet spot for good emissions results," Mr. Thiruvengadam said. "But when you're going at highway speed at 70 miles an hour, everything should really work properly. The emissions should come down. But the Volkswagens didn't come down."

Even then, however, it is difficult for most researchers to be sure exactly what is going on. There are so many factors involved in real-world driving — speed, temperature, topography, braking habits. It is not unheard-of for cars to perform much differently in on-the-road tests than one expected.

But this time there was a key difference: The California Air Resources Board heard about the groups' tests and signed on to participate. The regulators tested the same vehicles in their specially equipped lab used to judge cars' compliance with state emissions standards. That gave the project what most studies lacked: a baseline.

"That broke loose everything," Mr. Thiruvengadam said.

In the lab, the two VWs performed flawlessly. But when they were taken out on the roads in California, they were belching out levels of nitrogen oxide that were 30 to 40 times higher than the regulatory standards. Even the heavy-duty trucks the researchers had tested had never performed that poorly by comparison.

"It just didn't make sense," said John German, one of the leaders on the project at the

transportation council. “That was the real red flag for us.”

Volkswagen Credit Spreads Soar After EPA Charges Co. With Evading Pollution Controls

John Atkins, CONTRIBUTOR

Credit spreads referencing German automaker Volkswagen widened sharply today after the U.S. Environmental Protection Agency on Friday charged the company with evading government pollution controls through software designed to allow diesel models to meet clean-air standards, but only during official emissions testing. The government demand for recalls affects roughly 500,000 vehicles.

Volkswagen five-year CDS costs increased 80% today, rising 60 bps to the 135 bps area, or a high since 2012, trade data show. The 2.45% notes due Nov. 20, 2019 issued by subsidiary Volkswagen Group of America Finance last November, at T+85, changed hands today as much as 77 bps wider on the session, reaching at G-spread equivalents as wide as T+180, according to MarketAxess.

Credit analysts today noted the significant potential risks to VW’s credit standing and reputation. “VW’s operating margins have lagged peers (BMW, Daimler) for some time, and the automaker has cited encouraging U.S. vehicle sales in the context of its 2015 revenue and profit outlook,” stated FTN Financial senior credit strategist Benjamin Millard in a credit note.

While it acknowledged uncertainties regarding the impact of the scandal on Volkswagen’s brand image and reputation – and terming the development a “crisis” for VW – Fitch today said the scandal is unlikely to trigger an immediate downgrade of Volkswagen’s A rating, even though Volkswagen reportedly faces a maximum penalty of $18 billion as well as any costs related to a

recall effort.

"We believe the fine is unlikely to amount to the theoretical maximum amount of USD37,500 per car, although there have been only very few precedents of such cases and associated fines. In addition, the group's financial structure is sound and its free cash flow (FCF) generation extremely robust," Fitch stated today.

The outlooks on the respective A/A2 ratings at S&P and Moody's are currently stable, through S&P warned as recently as Sept. 7 that stricter carbon rules were fueling high capital spending demands on Europe's carmakers.

The Volkswagen Diesel Emissions Scandal, By the Numbers

Ethan Wolff-Mann @ewolffmann Sept. 21, 2015

VW is accused of faking pollution tests on a grand scale.

Last week, the EPA accused Volkswagen of deliberately falsifying tests of its diesel engine cars so that the vehicles would pass anti-pollution standards. A massive recall of nearly half a million Volkswagen diesel cars was ordered, causing a major stir in the industry—and especially among VW owners who had been drawn to the vehicles because of the automaker's "clean diesel" claims.

Let's look at the situation by the numbers.

482,000 Diesel cars affected, which include TDI Jettas, Beetles, Golfs, and Audi A3s from 2009-15 and Passats from 2014-15.

$37,500 Fine per vehicle that the German automaker could face in the U.S.

$18 billion Possible total penalties faced by Volkswagen, and that figure doesn't include fixing the recalled cars.

40 Times over the legal limit of certain types of pollution emitted by the vehicles, including nitrogen oxide—which can cause respiratory problems.

$6,855 Premium that buyers were paying for Passat TDI cars over standard gasoline versions.

-20% The hit Volkswagen stock has taken since the scandal.

12 Number of months Volkswagen has been denying cheating on the emissions test.

2017 When Volkswagen may sell diesel cars again in the U.S., now that sales have been halted.

2.0 Liter 4-cylinder engines affected. Larger diesel engines used in SUVs don't have the software at the center of the controversy.

$0 Current resale value of affected cars in California, because the cars were sold as "non-compliant" (and therefore cannot be resold).

14.28% Of affected cars that are registered in California

23 Percentage of Volkwagens sold in August that were diesels.

-

Automotive News:

http://www.autonews.com/article/20150921/OEM11/150929980/vws-diesel-sales-frozen-until-compliance-is-proven-epa-official-says

VW's diesel sales frozen until compliance is proven, EPA official says

Fix must be approved before recall can begin

Chris Grundler: "It will take more work to determine what the appropriate remedy for these vehicles is."

By Ryan Beene

WASHINGTON -- With its diesel car lineup grounded by an emissions-test cheating scandal, Volkswagen now bears the burden of proving that these vehicles comply with federal emissions standards, the EPA's top auto regulator said.

Until then, said Chris Grundler, director of the EPA's Office of Transportation Air Quality, no sales.

Meanwhile, Grundler said, the EPA and California regulators are now probing all light-duty diesel vehicles in the U.S. market from all manufacturers to check for illegal software designed to fool U.S. emissions tests.

U.S. regulators accused VW on Friday of violating the Clean Air Act by selling 482,000 diesel-

powered vehicles with such illegal software. The agency said the company admitted to fitting seven model years' worth of diesel cars with the softwared -- termed a "defeat device" -- that would activate the cars' emission controls during testing, but deactivate them in real-world driving.

In order to be able to resume sales of diesels, Grundler said, VW has to engineer a fix to bring those vehicles into compliance, and receive EPA approval before a recall can commence. It's not clear yet whether that fix will consist of a change to the engine's emission control software or more substantial engineering changes to vehicle hardware, Grundler said.

According to the EPA's website, it could take up to one year to identify "corrective actions," develop a recall plan and issue recall notices. But Grundler declined to discuss a specific timetable.

"Until we gather that information and are convinced ... we're not going to go forward with the recall," Grundler said. "It will take more work to determine what the appropriate remedy for these vehicles is."

Capitol Hill

U.S. lawmakers want more answers, too.

Republican leaders of the House Energy and Commerce Committee today announced plans to hold a hearing on the VW emissions scandal in the near future. The hearing will be held before the panel's Oversight and Investigations Subcommittee, though no date has been set.

"We will follow the facts. We are also concerned that auto consumers may have been deceived – that what they were purchasing did not come as advertised," U.S. Reps. Fred Upton, R-Mich., and chairman of the Energy and Commerce Committee and Tim Murphy, R-Pa., chairman of the investigations subcommittee, said in a joint statement.

"The American people deserve answers and assurances that this will not happen again. We

intend to get those answers."

Also in Washington, the White House said today it was "quite concerned" about reports it was seeing concerning VW's conduct in complying with U.S. Clean Air Act requirements.

"It's fair to say that we're quite concerned by some of the reports that we've seen about the conduct of this particular company, but ultimately this is the responsibility of the EPA to take a look at it and that's exactly what they're doing," said White House spokesman Josh Earnest.

California questions

VW will also have to convince the EPA and California's Air Resources Board that its 2016 model year diesel vehicles will comply with emissions standards and are free of any illegal software, Grundler said. Until then, the agency will continue to withhold the emission certifications needed to begin sales of those models, which are currently being withheld from dealers.

The sales suspensions are a blow to Volkswagen, which counts on diesels for more than one-fifth of the VW brand's sales volume, and has touted its "clean diesel" technology as a key differentiator in the marketplace.

"We've been working with the company for a long time trying to get answers and it wasn't until very recently that VW admitted that these vehicles contained software designed to defeat the emissions standards," Grundler said. "We want to make sure that 2016 model vehicles don't operate the same way."

Popular Mechanics:

http://www.popularmechanics.com/cars/a17430/ezra-dyer-volkswagen-diesel-controversy/

This VW Diesel Scandal Is Much Worse Than a Recall

This isn't cost-cutting. This is outright cynical deceit.

By Ezra Dyer

Most of the time, media test cars are distinguished only by a license plate that might bear a discreet "manufacturer" tag. Audi diesels, though, are a different matter. Whether a Q7 or an A3, the diesel press cars from Audi (which is part of the Volkswagen group) always bear towering "TDI Clean Diesel" decals across their flanks. I guess the theory is that when the cars are out on the road they're serving double duty as billboards, spreading the gospel about the Volkswagen group's engineering prowess.

A few years ago I bought a nasty Ford F350 diesel for an engine swap, and I parked it next to an Audi A3 and took a few shots to capture the juxtaposition: truck from the dirty diesel past, Audi harkening to the clean-burning future. That certainly looks ironic today.

If you're not up to speed on Volkswagen's shenanigans, you can catch up here. Suffice to say that it seems the A3's sanctimonious TDI Clean Diesel stickers were relevant only when the cars were actually undergoing an EPA emissions test. Out in the real world, 2.0-liter Volkswagens and Audis were as much as 40 times above the legal emissions limit for nitrogen oxides (NOx). According to the EPA, about 482,000 four-cylinder Volkswagens and Audis built since 2009 included what the agency defines as a "defeat device," which is really just software that detects an emissions test and "turns full emissions controls on only during the test." The cheater software was discovered by researchers at West Virginia University who were trying to document the cleanliness of modern diesels. Volkswagen surely wishes they hadn't bothered.

The revelation of this emissions subterfuge answers at least two questions about VW's mighty little diesel. The first concerns urea injection, which every other modern diesel uses to pass emissions tests. The urea-injection systems help to neutralize NOx emissions, but they also add weight and cost to the car, and saddle car buyers with yet another tank of liquid that must be monitored. If you run out of this diesel exhaust fluid, it's like running out of fuel—on trucks with such systems, running dry on urea triggers a severe limp-home mode with a 5 mph speed limiter. That's how seriously the EPA takes NOx.

Everyone wondered how VW met emissions standards while foregoing urea injection. As it turns

out, they didn't. It wasn't magical German engineering. Just plain old fraud.

The second question concerned fuel economy. It's been widely noted that four-cylinder TDIs tend to smash their EPA fuel economy estimates in real-world driving. The last TDI Jetta SportWagen I drove was rated at 42 mpg highway, but on 60-mph two-lane roads I averaged more like 50 mpg. That's a huge difference. Did running non-compliant emissions improve fuel economy? That's possible. And if so, that raises an interesting question: When the cheater VWs emitted too much NOx, were they also emitting a lot less CO2 thanks to improved economy? Maybe the good doesn't offset the bad, but it's something to consider. You can bet that VW's lawyers will.

THE INTENTIONALITY BEHIND THE DECEIT MAKES THIS SITUATION DIFFERENT FROM EVEN A HUGE-SCALE RECALL.

So, how is Volkswagen going to fix this? Putting aside the inevitable fines, possible criminal charges, and massive public disgrace, there are half a million cars running an emissions setup that never should've left the factory. And there's no quick fix to make up for VW's lies.

All the other carmakers control diesel emissions by spraying a urea solution into the exhaust stream, where a catalyst converts it to ammonia. The ammonia breaks down NOx into nitrogen and water. If all of that sounds like it would be tough to bolt right in, you're correct. Maybe VW can meet the standards without adding equipment—say, by tweaking the engine control unit (ECU) with a different tuning. But what if that new tuning meets the emissions standards but sacrifices performance or fuel economy? Now you've got 482,000 customers on a class action lawsuit.

There's no easy way out of this, but they'd better figure something out, and pronto. Right now dealers are banned from selling 2.0-liter TDIs, which make up about a quarter of VW's U.S. sales. News of the scandal caused VW to lose about a quarter of its market value, indicating that investors understand how bad this is. There's no cheap fix nor easy settlement here.

The intentionality behind the deceit makes this situation different from even a huge-scale recall. This isn't a story about a part that was made one cent cheaper than it should've been, where a car company cut a corner to save a little cash. It's about a huge corporation eying the rulebook and deciding there's a competitive advantage in violating the Clean Air Act. Incompetence is one thing, but calculated mendacity is quite another.

It's too bad. That Golf SportWagen TDI is a punchy, fun car. It's got great fuel economy, tons of torque and a bargain price. But when something seems a little too good to be true, maybe that's because it is.

VW comes clean on dark heart of its diesel cars. Can it clear the air?

Phil Rosenthal

Seems VW fought diesel wars with smoke and mirrors, mostly smoke. What the fahrvergnügen?!

Volkswagen called it clean diesel. Clean like Lance Armstrong. Clean like the Chicago River.

Seriously, what the fahrvergnügen?!

VW has admitted to the Environmental Protection Agency that hundreds of thousands of its diesel cars have been using what is literally a killer app.

The software allowed the vehicles to sail through U.S. emissions tests while reportedly spewing 10 to 40 times the level of certain pollutants as allowed in ordinary use.

It's been smoke and mirrors — mostly smoke — for the last seven model years.

We're talking about 2009, 2010, 2011, 2012, 2013, 2014 and 2015 VW Golfs, Jettas and Beetles, along with Audi A3s, equipped four-cylinder, 2.0-liter turbodiesel engines. Oh, almost forgot the 2012-15 Passats.

That's nearly half-a-million vehicles in all, belching nitrogen oxide to preserve mileage ratings and performance no other carmaker could seem to match, thanks to emissions control systems programmed to operate only when testing protocols were detected.

So we get more smog and ozone and poisons tied to a litany of health problems, such as asthma attacks and other respiratory diseases, along with premature death. VW gets more car sales.

Score one for German engineering and systematic subterfuge, trading our health for its profits.

Apparently the EPA was first tipped to VW's plot when discrepancies showed up in independent testing. But it seems like precisely the sort of thing James Bond is told of when strapped to a nuclear missile about to launch.

The word diabolical comes to mind.

So does evil.

One pictures even C. Montgomery Burns, king of the corner-cutters on "The Simpsons," looking askance. And we don't know yet if VW is the only offender.

The auto industry isn't overburdened by high expectations, particularly in the last 12 months or so.

General Motors last week agreed to a $900 million settlement to end a criminal investigation into its failure to disclose a deadly ignition defect.

Toyota last year agreed to a $1.2 billion penalty for withholding information about its vehicles' unintended acceleration linked to other fatalities.

Takata, it's been revealed, knew of dangerous, potentially fatal defects in its airbags long before alerting federal regulators, leading to the recall of millions of Honda, Toyota, Chrysler, Subaru, GM, Mitsubishi, BMW, Mazda, Nissan and Ford vehicles.

Yet, as Automotive News noted, "Compared with other run-ins between the EPA and automakers, VW's alleged violation stands out in its brazenness."

This takes that kind of amoral corporate behavior to a whole other threat level.

VW didn't just conceal something it discovered endangering people. It created technology for the specific purpose of allowing it to benefit from endangering people.

Even if you're one of those people who somehow isn't a fan of clean-air standards, it's not a political statement to press on and try to throw authorities off the trail. It's just a crime.

Tampering with emissions control systems, under terms of the Clean Air Act, could mean a fine for VW as high as $37,500 per vehicle or roughly $18 billion, though you know what happens when you start to haggle with car guys.

But even if VW is fined and there's a mandatory recall, some drivers will be reluctant to embrace the fix because it likely will make the vehicle less effective and efficient than the one they thought they bought.

Funny we never caught wind of any of this in those slightly discomfiting VW commercials with the old ladies hitting on a salesman. Least we don't remember any mention of it.

VW pulled the ads off the air and, to the extent it could, off YouTube as word of its scandal came out, yet more proof that a carmaker can indeed move fast to protect something it actually cares about — like its bottom and bottom line.

This isn't the Olympics. It's one thing to try to keep test results from showing banned substances in one's own body, quite another to try to mask bad stuff being inflicted on others.

Cough.

This goes beyond the venality of one corporation to whether there's any confidence left in diesel cars and credibility in the entire auto industry. Even if this is as far as it goes, it will take quite a while to clear the air.

VW recently surpassed Toyota to become the world's largest carmaker, an achievement now eclipsed by the suspicion that there is nothing it wouldn't do.

Volkswagen faces US criminal probe on emissions

The US Justice Department is conducting a criminal investigation of Volkswagen's admission to cheating on federal air pollution tests, according to two US officials familiar with the inquiry.

Volkswagen said last week it's cooperating with regulators probing gaps between emissions on the road and lab tests on some diesel models, affecting more than half a million cars. The US officials described the inquiry on condition of anonymity because it's a continuing investigation.

The Wolfsburg, Germany-based automaker plunged as much as 23 per cent Monday to 125.40 euros in Frankfurt, wiping out about 15.6 billion euros ($US17.6 billion) in market value. The stock closed at 132.2 euros, its lowest in more than three years.

Volkswagen's admission is putting pressure on Chief Executive Officer Martin Winterkorn to repair the reputation of the world's biggest carmaker. Winterkorn, whose contract renewal is scheduled for a supervisory board vote on Friday, now faces a serious challenge to his leadership, said Arndt Ellinghorst, a London-based analyst for Evercore ISI.

"This latest saga may help catalyze further management changes at VW," Ellinghorst wrote in a note Monday.

Justice Department spokesman Wyn Hornbuckle declined to comment.

Criminal inquiries can take months or years and lead to charges against individuals and companies. They can also result in fines and deferred-prosecution agreements, such as the one recently struck with General Motors Co., to spur companies into improving their behaviour and addressing problems revealed during the investigations.

Volkswagen admitted on September 18 to fitting some of its US diesel vehicles with software that turns on full pollution controls only when the car is undergoing official emissions testing, the Environmental Protection Agency said Friday. Affected are diesel versions of the VW Jetta, Golf, Beetle and Passat and the Audi A3.

During normal driving, the cars with the software -- known as a "defeat device" -- would pollute 10 times to 40 times the legal limits, the EPA estimated. The discrepancy emerged after the International Council on Clean Transportation commissioned real-world emissions tests of diesel vehicles including a Jetta and Passat, then compared them to lab results.

VW said it's cooperating with regulators probing gaps between emissions on the road and lab tests on some diesel models. According to the EPA, the company insisted for a year that discrepancies were mere technical glitches.

Winterkorn, who has led VW since 2007, was forced to halt sales of the cars on Sunday and issue a public apology, saying he's "deeply sorry" for breaking the public's trust and that VW would do "everything necessary in order to reverse the damage this has caused."

The violations could result in as much as $US18 billion in fines, based on the cost per violation and the number of cars.

The US accusations are "grave" and must be clarified swiftly, said Stephan Weil, prime minister of the German state of Lower Saxony, which owns 20 percent of Volkswagen's voting shares. "Possible consequences can be decided after that."

The European Commission also said it's taking VW's cheating seriously and is in contact with

US regulators and the company about details of the case.

The Guardian:

http://www.theguardian.com/business/2015/sep/21/volkswagen-emissions-scandal-sends-shares-in-global-carmakers-reeling

Volkswagen emissions scandal could snare other companies, whistleblower claims

Billions wiped off value of industry heavyweights amid concerns that manipulation of air pollution data could be 'very widespread'

Joanna Walters Graham Ruddick and Sean Farrell

The emissions-fixing scandal that has engulfed Volkswagen in the US could extend to other companies and countries, one of the officials involved in uncovering the alleged behavior told the Guardian on Monday.

Billions of pounds have been wiped off the value of global carmakers amid growing concerns that emissions tests may have been rigged across the industry.

"We need to ask the question, is this happening in other countries and is this happening at other manufacturers? Some part of our reaction is not even understanding what has happened exactly," said John German, one of the two co-leads on the US team of the International Council for Clean Transportation (ICCT), the European-based NGO that raised the alarm.

Shares in Volkswagen fell by almost a fifth after the world's second biggest carmaker issued a public apology in response to US allegations that it used a "defeat device" to falsify emissions data.

The US Justice Department is conducting a criminal investigation of Volkswagen admission, according to Bloomberg, which cited two officials familiar with the inquiry.

The company could face a fine of up to $18bn (£11.6bn), criminal charges for its executives, and legal action from customer and shareholders. The US law firm Hagens Berman has already launched a class-action law suit on behalf of customers who bought the affected cars.

VW shares fell by 19% in Frankfurt, wiping almost €15bn (£10.8bn) off its value. Shares in Renault, Volkswagen's French rival, also dropped by 4%, while Peugeot was down 2.5%, Nissan 2.5% and BMW 1.5% amid concerns they could be caught up in investigations.

The US Environmental Protection Agency said on Friday that VW had installed illegal software to cheat emission tests, allowing its diesel cars to produce up to 40 times more pollution than allowed. The US government ordered VW to recall 482,000 VW and Audi cars produced since 2009.

In response, Martin Winterkorn, chief executive of VW, said on Sunday he was "deeply sorry" for breaking the trust of the public and ordered an external investigation.

German tipped off regulators at the California Air Resources Board (Carb) and the US Environmental Protection Agency (EPA) after conducting tests that showed major discrepancies in the amount of toxic emissions some VW cars were pumping out compared with the legal limits.

Max Warburton, an analyst at the financial research group Bernstein, said: "There is no way to put an optimistic spin on this – this is really serious."

A British expert in low-emission vehicles claimed the manipulation of air pollution data could be "very widespread" and that tests in Europe are "much more open to this sort of abuse".

Greg Archer, a former government adviser and head of clean vehicles at the respected Transport & Environment thinktank, said: "I am not surprised. There has been a lot of anecdotal evidence about carmakers using these 'defeat devices'. All credit to the US's EPA for investigating and finding the truth."

Archer, the former managing director of the UK's Low Carbon Vehicle Partnership and non-executive director for the government's Renewable Fuels Agency, said the scandal could spread into petrol cars and CO2 levels. "It is probably not limited to diesel and not limited to emissions," he added.

The "defeat devices" are thought to work by injecting more urea – an exhaust fluid – into the car when it is being tested. This limits nitrogen oxide emissions. The car detects it is being tested because devices such as the anti-collision systems have to be turned off when it is in the laboratory. The extra urea is not injected into the car when it is on the road because it would quickly run out.

Archer claims European tests are more open to abuse because they are conducted before the car goes into mass production and by companies that have been paid by the carmakers. These testing companies have been verified by regulators in each country, such as the Vehicle Certification Agency, but in the US the tests are conducted by an independent body.

Industry leaders in Britain claimed there was "no evidence" that manufacturers are cheating the system in Europe but admitted it needs to be reformed.

Mike Hawes, chief executive of the Society of Motor Manufacturers and Traders, the industry trade body, said: "The EU operates a fundamentally different system to the US – with all European tests performed in strict conditions as required by EU law and witnessed by a government-appointed independent approval agency. There is no evidence that manufacturers cheat the cycle.

"The industry acknowledges, however, that the current test method is outdated and is seeking agreement from the European Commission for a new emissions test that embraces new testing technologies and is more representative of on-road conditions."

The US allegations involve a series of diesel cars produced by VW and the brands it owns, such as Audi. These include the Audi A3, VW Jetta, Beetle, Golf and Passat models. VW has halted sales of these models.

Jochen Flasbarth, a senior environment official in the German government, accused Volkswagen of "blatant consumer deception" over the scandal. The country's economy minister, Sigmar Gabriel, also warned it could damage the reputation of the country's vital automotive industry.

"That this is a bad case, I think is clear," Gabriel said. "You will understand that we are worried that the justifiably excellent reputation of the German car industry and in particular that of Volkswagen suffers." The German government has launched its own investigation into VW and held talks with executives.

The scandal puts the future of Volkswagen chief Winterkorn in serious doubt. Earlier this year he won an internal power struggle with Ferdinand Piëch, who stepped down as chairman. The board of the company is due to meet on Friday to discuss extending Winterkorn's contract.

Winterkorn has been at the helm of VW since 2007 and has been directly responsible for research and development since then.

Guido Reinking, a German automotive analyst, told German television station n-tv: "It's almost impossible to imagine that he didn't know about this special way of programming the engine."

David Bailey, professor of industrial strategy at Aston University in Birmingham, said: "If it is the case that they have been trying to hoodwink regulators, it's a really dumb thing to do. Regulators will look at this more closely now. There has been growing concern about diesel cars and nitrous oxide emissions. The industry has been trying to make the case that the latest regulations largely deal with that issue but regulators will now look more closely at whether they have."

In the wake of the scandal two senior VW executives cancelled a planned appearance at a media event in New York with rock star Lenny Kravitz scheduled for Monday evening.

Herbert Diess, chairman of the VW brand's management board, and Heinz-Jakob Neusser, VW's board member in charge of technical development, had planned to attend the event to introduce the latest version of the Passat mid-size sedan.

The chief executive of VW's US arm, Michael Horn, was still due to attend the event. He is expected to provide a statement about the situation.

Volkswagen Is Now The Target Of A Criminal Investigation: Report

Michael Ballaban

In a move that seemed like an inevitability at this point, the United States Department of Justice is said to have opened a criminal investigation into Volkswagen's admission to cheating on diesel emissions tests, a report from Bloomberg said.

While we had heard rumblings of a possible criminal probe earlier, this news appears to confirm that VW is in fact the subject of an investigation that could lead to prosecutions.

It's way too early to tell whether or not any individuals will personally be held criminally liable for the company's deceptions, but it's not out of the realm of possibility. We haven't seen a case in a long time where a company has admitted intentionally circumventing the law, rather than just a plea of massive institutional incompetence, so it's anyone's guess as to what will happen.

The U.S. Environmental Protection Agency has said that the company can be held responsible for up to $18 billion in fines.

Business Insider:

http://www.businessinsider.com/the-us-government-is-launching-a-criminal-investigation-into-vws-falsified-emissions-figures-2015-9

The US government is launching a criminal investigation into VW's falsified emissions figures

Benjamin Zhang

The US Department of Justice has launched a criminal probe into Volkswagen's falsification of emissions data, Bloomberg news is reporting.

Last week, the Environmental Protection Agency accused the automaker of falsifying the data using secret software in nearly 500,000 cars.

According to Bloomberg's Del Quentin Wilber, two government officials close to the situation say the Justice Department is conducting a criminal investigation into the allegations.

Last week, the EPA accused VW of using the hidden software — called a "defeat device" — to

dodge clean-air standard during emissions testing.

"Using a defeat device in cars to evade clean air standards is illegal and a threat to public health," assistant administrator for the Office of Enforcement and Compliance Assurance Cynthia Giles said in a statement on Friday.

“Working closely with the California Air Resources Board, EPA is committed to making sure that all automakers play by the same rules. EPA will continue to investigate these very serious matters.”

The EPA alleges that VW installed software that detects when the car is undergoing emissions testing, at which point the software would turn on all of the car's emissions control systems. But the EPA claims that the software greatly reduces the cars' pollution-control systems during normal driving conditions.

"This results in cars that meet emissions standards in the laboratory or testing station, but during normal operation, emit nitrogen oxides, or NOx, at up to 40 times the standard," the EPA said in a statement.

Across the Atlantic, the German government is also taking a look at Volkswagen's emissions data. A spokesperson for the country's Motor Vehicle Agency told the Wall Street Journal that is has asked automakers to provide accurate emissions information to "determine whether similar instances of manipulation have taken place in Germany or Europe," However, there is no word of any official investigation on the part of the German government.

Over the weekend, VW CEO Martin Winterkorn issued the following statement:

The U.S. Environmental Protection Agency and the California Air Resources Board (EPA and CARB) revealed their findings that while testing diesel cars of the Volkswagen Group they have detected manipulations that violate American environmental standards.

The Board of Management at Volkswagen AG takes these findings very seriously. I personally am deeply sorry that we have broken the trust of our customers and the public. We will cooperate fully with the responsible agencies, with transparency and urgency, to clearly, openly, and completely establish all of the facts of this case. Volkswagen has ordered an external investigation of this matter.

The recall affects 482,000 diesel-powered cars sold in the US since 2008. They include:

Volkswagen Jetta TDI: 2009-20015

Volkswagen Beetle TDI: 2009-2015

Audi A3 TDI: 2009-2015

Volkswagen Golf TDI: 2009-2015

Volkswagen Passat TDI: 2014-2015

We have reached out to Volkswagen and the DOJ for comment. We will update when when we hear back.

Dear Volkswagen: Exaggeration? Not so bad. Deception? Never okay

by Jennifer Reingold @jennrein SEPTEMBER 21, 2015, 3:44 PM EDT

One wonders what would have happened had Volkswagen opted for exaggerating its results rather than falsifying them.

The business world—and the journalists who cover it—have always rewarded a healthy bit of hype. Best Ever! New and Improved! Now with enhanced whatevers!

Actually, the love of the big claim goes far beyond the business world and is interwoven throughout society. Donald Trump's current popularity is only the latest example of bombast, er, trumping reality.

But we do have limits, as the scandal at Volkswagen shows. So far, the company's stock price has fallen almost 20% since it admitted on September 18 that it had installed software that allowed its cars to fake their performance on emissions testing in order to fool the EPA.

No one knows what will happen to the $221 billion in sales car company—the world's largest—going forward, and whether the deception stretches all the way to the CEO, Martin Winterkorn. But one wonders what would have happened had the company opted for exaggerating its results rather than falsifying them.

Don't get me wrong: I'm not advocating that any performance standards—particularly those that affect safety and health—should ever be presented with anything but the full truth. But this move was so brazen, so breathtakingly full of chutzpah, that it is hard to imagine VW's brand recovering for a very, very long time; nor, one imagines, will its culture.

The plot goes far beyond one or two people hiding out in a cubicle and must have involved hundreds of people building such a system and making sure it was implemented inside of 428,000 cars. One wonders what the company might have been able to accomplish instead if it put all that brainpower toward meeting emissions requirements rather than circumventing them.

Consider the alternative: VW tried—and failed—to meet the EPA's emissions standards, after saying that they believed they had diesel engines that did the job. The EPA (which, it's worth noting, relies primarily on self-tested data) would have—hopefully—tested its engines, found Volkswagen deficient, and fined the company. It would have been costly, yes, but it wouldn't have been all that surprising. And VW's credibility wouldn't have been destroyed in the process. After all, exaggeration, for better or worse, is just how the game is played.

MarketWatch:

http://www.marketwatch.com/story/white-house-quite-concerned-about-volkswagen-emissions-charges-2015-09-21

White House 'quite concerned' about Volkswagen emissions charges

'Quite concerned': How White House press secretary Josh Earnest characterized Obama administration reaction to the allegations against Volkswagen.

By ROBERT SCHROEDER

The Obama administration is "quite concerned" over allegations that Volkswagen cheated on U.S. emissions tests, a White House spokesman said Monday, but added it is up to the Environmental Protection Agency to investigate the matter.

"I think it's fair to say that we're quite concerned by some of the reports that we've seen about the conduct of this particular company," spokesman Josh Earnest told reporters at a regular briefing.

On Friday, the Environmental Protection Agency and the California Air Resources Board alleged that Volkswagen VLKAY, -17.38% VOW3, -18.19% used software in cars to make diesel-powered engines appear to have lower levels of emissions than they actually did. The company halted U.S. sales of some diesel-powered cars.

Earnest said it is ultimately the responsibility of the EPA to look at the issue, "and that's exactly what they're doing."

Reaction from Congress was minimal — though that could change.

"VW should expect scrutiny from Congress, legal problems, a potential multibillion-dollar fine and a batch of uncomfortable headlines," wrote Forbes contributor Micheline Maynard on Monday.

"If Volkswagen willfully sought to evade the Clean Air Act and fraudulently sold cars to millions of consumers with this technology, EPA should pursue the most severe action possible to deter others from doing the same," Rep. Frank Pallone, a New Jersey Democrat, said on Friday.

"We must ensure that this does not happen again and that consumers can trust the products that they buy," said Pallone, the top Democrat on the House Energy and Commerce Committee. The panel's oversight and investigations subcommittee held one of the several hearings into the General Motors GM, +0.43% ignition-switch recall in April 2014.

The allegations reportedly include Volkswagen Passats made at the company's Chattanooga, Tenn., facility in 2014 and 2015. A Volkswagen spokesperson did not immediately return a request for comment.

MarketWatch reached out to members of Tennessee's congressional delegation, but none offered any comment.

The 1,400-acre Chattanooga plant has more than 3,200 Volkswagen employees, the company says.

Volkswagen's appalling clean diesel scandal, explained

Brad Plumer

It sounds like the sinister plot of some straight-to-DVD movie. Since 2009, Volkswagen had been installing elaborate software in 482,000 "clean diesel" vehicles sold in the US, so that the cars' pollution controls only worked when being tested by regulators. The rest of the time, the vehicles could freely spew hazardous, smog-forming nitrogen oxides.

Suffice to say, regulators were livid once they caught on. On Friday, the Environmental Protection Agency announced that Volkswagen had very flagrantly violated the Clean Air Act. Not only did the EPA order the German company to fix the affected vehicles,** but the agency has the authority to levy fines as high as $37,500 per car, a maximum of $18 billion. (To put that in perspective, the company's pretax net income was about $4.7 billion last year.) The US government is also mulling criminal charges.

Volkswagen, in other words, is in deep shit. The company's CEO, Martin Winterkorn, is now apologizing profusely and pledging an external probe to find out what happened. VW just halted US sales of its 2015 and 2016 clean diesel vehicles, including Passat, Jetta, Golf, and Beetle models. Meanwhile, VW's stock price plummeted on Monday morning, the company losing nearly one-fifth its market cap in a blink:

This scandal raises a few larger questions, though: Why did Volkswagen cheat in the first place? And why was it so easy for the company to evade regulators for years? To get a better handle on the story, we need to take a brief trip through the tangled history of clean diesel vehicles — the specific cars that VW was selling.

Clean diesel cars were supposed to offer great mileage and low pollution — a tricky task

One basic fact to understand here is that there are two main types of combustion engines widely available today: diesel and gasoline. And there are real trade-offs to each.

Diesel engines have long been popular in Europe, and one of their major advantages is fuel economy. Diesel fuel contains more energy per gallon than gasoline, and the diesel engines themselves are more efficient. Put it together, and the typical diesel car can travel up to 30 percent farther on a gallon of fuel than its gasoline counterpart.

But there's a catch. While diesel cars get better mileage and emit fewer carbon-dioxide emissions, they also emit more nitrogen oxides (NOx), which help form smog, and particulate matter, which can damage lungs. Both types of pollution can have serious health effects.

Historically, Europe has dealt with this trade-off by imposing looser emissions standards on diesel cars in order to pursue higher fuel economy. That's one reason European cities like Athens have a serious smog problem. In the United States, by contrast, we've imposed much stricter rules around smog and other conventional pollutants since the 1970s, one reason diesel cars haven't caught on as widely here. (Heavy trucks favor diesel engines, though.)

In recent years, however, things have shifted. The Obama administration has been ratcheting up fuel-economy standards in the United States, which puts a higher premium on mileage. At the same time, diesel technology has gradually been getting cleaner through a combination of lower-sulfur fuel, advanced engines, and new emission-control technology. So automakers have shown a renewed interest in "clean diesel" cars that, in theory, don't suffer from that trade-off between performance and pollution.

These vehicles have proved popular in the United States. Since 2009, Volkswagen has sold more than 482,000 clean diesel cars containing a four-cylinder turbocharged direct injection engine. This included versions of the Passat, Jetta, Golf, Beetle, and Audi's A3. Drivers liked them.

Except, as it turns out, VW was lying about its clean diesel cars.

Volkswagen couldn't balance performance with low pollution. So it cheated.

Since 2009, we now know, Volkswagen had been inserting intricate code in its vehicle software that tracked steering and pedal movements. When those movements suggested that the car was being tested by regulators in the laboratory for nitrogen-oxide emissions, the car automatically turned its pollution controls on. The rest of the time, the pollution controls switched off.

Regulators didn't notice this ruse for years. The problem was only uncovered by an independent group, the International Council on Clean Transportation, which wanted to investigate why there was such a discrepancy between laboratory tests and real-road performance for several of VW's diesel cars in Europe. So they worked with researchers at West Virginia University, who stuck a probe up the exhaust pipe of VW's clean diesel cars and drove them from San Diego to Seattle. (These details come from Dana Hull and Jeff Plungis' excellent Bloomberg tick-tock.)

What the researchers found was jaw-dropping. On the road, VW's Jetta was emitting 15 to 35 times as much nitrogen oxide as the allowable standard. The VW Passat was emitting 5 to 20 times as much. These cars were emitting much more pollution than they had in the labs.

Both California's air-pollution regulator and the EPA ordered Volkswagen to investigate and fix the problem in May 2014, and the company said it had worked on a software patch. Once again, the cars performed well in testing. And once again, real-world performance didn't match up. At that point, regulators started grilling Volkswagen's engineers about the discrepancy, and the company eventually cracked, admitting the existence of these defeat devices, which had been carefully hidden in the software code. Hence the scandal.

Volkswagen hasn't explained exactly why it cheated, but outside analysts have a pretty good guess. The NOx emission controls likely degraded the cars' performance when they were switched on — the engines ran hotter, wore out more quickly, and got worse mileage. Some experts have suggested that the emission controls may have affected the cars' torque and acceleration, making them less fun to drive. (Indeed, some individual car owners have been known to disable their cars' emission controls to boost performance, though this is against the law.)

In other words, Volkswagen wasn't able to produce diesel cars that had the ideal mix of performance, fuel economy, and low pollution. (Or, at least, they couldn't do this profitably.) So they "solved" this trade-off by sacrificing cleanliness and loosening the emission controls. And they accomplished this via software designed to deceive regulators. This was wildly illegal, and they got caught.

The VW scandal exposes problems with current emission tests

Volkswagen isn't the first company to cheat on its emission tests. As Frank O'Donnell of Clean Air Watch pointed out to me, the EPA caught a number of truck manufacturers, including Caterpillar and Volvo, doing something similar back in 1998 — programming their diesel trucks to emit fewer pollutants in lab tests than they did on the road. (The trucks would slowly emit more and more NOx as they traveled longer distances at constant speed, something that labs couldn't catch.)

Part of the problem here is that regulators tend to test these vehicles in laboratory conditions, which are fairly predictable and hence easier to game. Combined with the fact that automakers are developing ever-more-elaborate software that can control and fine-tune engines, and there are ample opportunities for fraud.

EUROPEAN REGULATORS WILL SOON START REQUIRING ON-ROAD EMISSIONS TESTING

In theory, there are ways to make cheating harder. Starting with model year 2017 vehicles, European regulators are going to start requiring automakers to test their passenger cars on the road in addition to laboratory testing. That sort of regime would've made it harder for Volkswagen to do what it did. But it's also unlikely that this is the last time we'll see an automaker come up with a fiendishly clever way to cheat.

Meanwhile, the VW scandal raises another issue surrounding car regulations, as Alex Davies explains at Wired. Modern-day cars feature complex computer systems and software. And, right now, this software is protected under the 1998 Digital Millennium Copyright Act — it's illegal to fiddle with it. The ostensible rationale is to make it harder for consumers to tamper with emissions controls. But these protections also make it harder for independent researchers to

scrutinize that code and identify problems like VW's little emissions trick. Some experts have proposed DMCA exemptions to allow researchers to test and evaluate these engines, but so far automakers and the EPA have resisted this. Presumably, if those exemptions had existed, Volkswagen might've been caught sooner.

Volkswagen is now facing serious consequences

At this point, Volkswagen has been caught red-handed and has to face the consequences. The company straight-up lied about its cars and exacerbated the country's air-pollution problem. (Getting a precise estimate of the health consequences here could be difficult, since it depends on where the cars were located, how much extra smog actually resulted, and so forth.)

In response, the company has pledged to stop selling 2015 and 2016 Volkswagen and Audi models equipped with clean diesel engines and will likely end up recalling the 482,000 cars now on the road to fix the software.** It's unclear how many customers will want to "fix" the problem, however, since, again, any patch might degrade gas mileage and/or performance.

Meanwhile, Volkswagen could face criminal prosecution — not to mention billions of dollars in fines, potentially. The Clean Air Act allows a fine of $37,500 per noncompliant vehicle. If the EPA really wanted to lower the hammer, that would amount to $18 billion. Again, VW's pretax net income was about $4.7 billion last year, so that would be a crippling hit. Volkswagen is the world's biggest automaker by sales, but it's not quite as profitable as competitors like Toyota and has already struggled to gain a foothold in the US market. This could be a huge deal for the company.

It also raises questions about the future of clean diesel vehicles. Clean diesel appears to be a promising technology — in theory, these vehicles could get both excellent mileage and low emissions. But this scandal raises serious questions about how well automakers can actually achieve both goals in practice.

** For any concerned car owners, the models expected to be recalled include: The 2009-2015 VW Beetle 2.0L TDI; 2009-2015 VW Golf 2.0L TDI; 2009-2015 VW Jetta 2.0L TDI; 2009-2015 Audi A3 2.0L TDI; and 2014-2015 VW Passat 2.0L TDI.

EPA accuses VW of cheating on emissions tests

BY JORGE WEINER ON SEPTEMBER 21, 2015 BUSINESS

VW halted sales of the models involved on Sunday and said it's cooperating with the probe and ordered its own external investigation into the issue.

"The charges here are truly appalling: that Volkswagen knowingly installed software that produced much higher smog-forming emissions from diesel vehicles in the real world than in pre-sale tests", said Frank O'Donnell, president of Clean Air Watch, a Washington-based advocacy group.

VW is to stop selling four cylinder diesel cars in the USA after the firm was found to have rigged emissions test on up to 500,000 vehicles, it has emerged. The reality is that Volkswagen will face huge fines, rumoured to be as high as 18 billion US dollars.

German competitors BMW AG and Daimler AG said on Monday they aren't aware of a similar USA probe into their cars.

Once on the road, the cars produced nitrogen oxide pollutants at up to 40 times the legal standard.

The EPA and California authorities acted quickly after being told of the violation, German said.

Volkswagen, which recently edged out Japan's Toyota to become the world's top-selling automaker, has had a hard year, its share price having fallen from more than 250 euros amid signs of faltering sales in the US and China. He said he was "deeply sorry" for the violation of United States rules. The models include Jetta, Beetle, Golf, Passat and Audi A3.

Stefan Bratzel, director at the Center for Automotive Management, a research group, said the damage to VW's image would be as great as the financial fines.

"Our climate policy stands for itself and I think it's internationally recognized that Germany is one of the drivers on the way to (the global climate summit in) Paris", he said. The potential wonderful is $37,500 per vehicle and 482,000 autos are a part of the case, yielding a possible superb of greater than $18 billion, Giles stated on a telephone name with reporters Friday.

The EPA in November 2014 hit South Korean auto makers Hyundai Motor Co. and Kia Motors Corp. with a record $100 million penalty for overstating fuel-economy claims and forced the companies to cough up another $200 million in regulatory credits.

The cars allegedly do so with software that detects when the vehicle is undergoing emissions testing, and then turns full emissions controls on only during the test. When vehicles are being driven normally, the computer disables the emissions controls.

According to the The New York Times, this latent software within numerous Volkswagen vehicles switches on emissions control systems only during an inspection. The California Air Resources Board issued a similar letter.

"Our goal is to ensure that the affected cars are brought into compliance, to dig more deeply into the extent and implications of Volkswagen's efforts to cheat on clean air rules and to take appropriate further action".

The feature, which the EPA called a "defeat device", masks the true emissions only during

testing.

VW under fire amid EPA accusations it cheated on emissions tests

By Thad Moore

Volkswagen shares plunged Monday after U.S. regulators accused the German automaker of cheating on emissions tests, alleging that nearly 500,000 cars weren't meeting federal standards.

An apology Sunday from VW's chief executive did nothing to temper anxious investors, who wiped out nearly a fifth of the company's value in a single day. VW's stock closed the day Monday at 132.20 euros, down 19 percent.

The selloff comes on the heels of Environmental Protection Agency allegations that the automaker had designed software to let its diesel cars detect when they were being tested for emissions.

VW, one of the world's largest automakers, has halted sales of some vehicles in the United

States and pledged to cooperate with regulators. “We at Volkswagen will do everything that must be done in order to re-establish the trust that so many people have placed in us, and we will do everything necessary in order to reverse the damage this has caused,” Martin Winterkorn, VW’s chief executive, said in a statement.

In the lab, they met standards. On the road, regulators say, they emitted nitrous oxide at up to 40 times federal standards. The software, known as a “defeat device,” was installed in some 482,000 cars, spanning model years 2009 through 2015, regulators say.

The EPA and California regulators began asking questions in May 2014 after West Virginia University researchers published a study that found lab results didn’t match up with road tests.

For more than a year, VW told regulators that the difference owed to “various technical issues and unexpected in-use conditions,” the EPA said in a letter sent to the automaker Friday. But company officials didn’t admit to the practice until earlier this month when regulators threatened not to approve its 2016 line of diesel cars.

The years-long practice could carry a hefty price tag for the automaker. The company could be fined $37,500 for each car it sold with a defeat device installed — a potential fine of $18 billion.

“The company will have to recall nearly 500,000 affected cars, which will cost it millions of dollars, and that’s even before the damage to its brand and potential fines,” Michael Hewson, chief market analyst at CMC Markets, told the Associated Press.

The revelation also led Consumer Reports[consumerreports.org] to pull its recommendation of VW’s Jetta and Passat diesel model. (The magazine said it would reconsider its decision once the automaker introduces a fix to lower emissions.)

For his part, Winterkorn apologized Sunday, saying the company would cooperate “with transparency and urgency.”

"I personally am deeply sorry that we have broken the trust of our customers and the public," he said in a statement. "We do not and will not tolerate violations of any kind of our internal rules or of the law."

Volkswagen Denied Deception to E.P.A. for Nearly a Year

By JACK EWING SEPT. 21, 2015

FRANKFURT — For nearly a year, Volkswagen officials told the Environmental Protection Agency that discrepancies between the formal air-quality tests on its diesel cars and the much higher pollution levels out on the road were the result of technical errors, not a deliberate attempt to deceive Washington officials.

But early this month, Volkswagen executives finally made a startling admission: The diesels it sold in the United States had software deliberately designed to cheat on the tests.

The company was evidently concerned that actually meeting the federal emissions standards would degrade the power of the engines, which it marketed as comparable in performance to gasoline engines. Meeting the standard would also undercut the fuel efficiency that is one of the main selling points of diesels.

The admission came only after the E.P.A. threatened to withhold approval for Volkswagen's new 2016 models, according to letters sent to company officials by the E.P.A. and California regulators.

Since news of that mass deception broke on Friday, Volkswagen has scrambled to conduct damage control, with its chief executive issuing an apology and the company saying it would not sell its 2015 and 2016 diesel cars in the United States.

But that did not stop Volkswagen shares from plummeting when trading opened in Europe on Monday. And the apology has not relieved pressure on Martin Winterkorn, the Volkswagen chief executive, whom analysts said would have tough questions to answer, seeking to know when he and other top executives at the company, which is ruled from the top with Germanic precision, were aware of the diesel deception.

Adding to pressure on Volkswagen, the German government said on Monday that it would also begin an inquiry to make sure that Volkswagen and other carmakers are complying with laws on auto emissions.

The E.P.A. disclosed the yearlong series of letters with Volkswagen as part of accusations it made against the company on Friday. The agency will require the company to recall nearly half-a-million vehicles equipped with 2-liter diesel engines dating to the 2009 model year. Volkswagen also faces fines that could run into the billions of dollars.

Volkswagen shares plunged about 20 percent on Monday, as investors registered alarm at the damage the company could suffer.

Mr. Winterkorn issued an apology on Sunday, saying the company had "broken the trust of our customers and the public."

But the sophistication of the software used to manipulate emissions tests in the United States, and extensive attempts by Volkswagen to deflect official scrutiny before admitting misconduct

this month, are sure to raise questions about Mr. Winterkorn's effectiveness only months after he survived an internal power struggle.

"Either he knew, or he didn't know, which is even worse," said Ferdinand Dudenhöffer, a professor at the University of Duisburg-Essen who is a longtime Volkswagen critic. "Any politician in his situation would have to resign."

Volkswagen's supervisory board, which Mr. Winterkorn reports to, will hold a regularly scheduled meeting on Friday, and it is certain to discuss the E.P.A. action.

After being confronted last year with evidence that some diesel models did not comply with pollution standards under certain conditions, Volkswagen executives originally offered technical explanations, according to a letter of complaint sent to the company by the E.P.A. and the California Air Resources Board.

It was only on Sept. 3, according to the letters, that executives at Volkswagen of America, the company's United States unit, admitted that cars equipped with the 2-liter diesel motors contained the software.

The software measured factors such as the position of the steering wheel, the vehicle's speed and even barometric pressure to sense when the car was being subjected to testing, the E.P.A. said. The car then configured itself to reduce emissions of nitrogen oxide, a gas that is a major contributor to smog and is linked to an array of respiratory ailments including asthma, emphysema and bronchitis, the E.P.A. said on Friday.

Volkswagen is known for being a tightly controlled, autocratic organization, raising questions about how such a sophisticated system could have been installed in nearly half a million vehicles without knowledge of top management.

The plunge in Volkswagen shares was a clear indication that investors believe that company profit and sales could suffer because of the E.P.A. accusations. However, Volkswagen is relatively immune to stock market pressure because only 12 percent of its voting shares are

traded. Porsche Automobil Holding, controlled by members of the Porsche family, holds a slight majority. The state of Lower Saxony owns 20 percent and the sovereign wealth fund of Qatar owns 17 percent.

Stephan Weil, the prime minister of Lower Saxony, where Volkswagen has its headquarters and major manufacturing operations, said in a statement on Monday, "Manipulation of an emissions test is completely unacceptable and without any justification."

But Mr. Weil said consequences could be discussed only after a thorough investigation of the circumstances.

In Berlin, the government of Chancellor Angela Merkel said it would ask carmakers for information as the first step in an inquiry.

"We expect reliable information from carmakers so that the Federal Office for Vehicles can check whether similar manipulation in the exhaust systems has taken place in Germany or Europe," Andreas Kübler, a spokesman for the Environment Ministry, told reporters in Berlin.

The European Commission has contacted Volkswagen as well as the E.P.A. for details about the accusations, a commission spokeswoman said.

"It is premature to comment on whether any specific immediate surveillance measures are also necessary in Europe and whether vehicles sold by Volkswagen in Europe are also affected," the spokeswoman said in an email. "We are taking the matter very seriously."

South Korea also planned to test Volkswagen cars to make sure they were in compliance with pollution rules, according to news reports.

More than half of all vehicles sold in Europe are diesels, which are popular because they typically offer better fuel economy than gasoline. European Union pollution rules were more

favorable to diesels than United States rules, but they have been progressively tightened. The most recent standard, known as Euro 6, took effect for all new cars sold on Sept. 1.

Technology exists to reduce the amount of nitrogen oxides emitted by diesels. But the technology also tends to reduce fuel economy as well as performance. The software installed by Volkswagen on vehicles sold in the United States avoided this trade-off, which could have come as a disappointment to American customers, by scaling back pollution controls when the car was not being tested.

The accusations by the E.P.A. are a blow to Volkswagen's efforts to build up its meager market share in the United States, in part by promoting "clean diesel" technology.

The silver lining for Volkswagen, though, may be that its most profitable vehicles in the United States are Porsche and Audi cars not affected by the E.P.A. action. The cars affected are Volkswagen Golf, Jetta, Beetle and Passat models from 2009 through 2015 that are equipped with 2-liter diesel engines.

Another silver lining for Volkswagen may be that diesel powered cars account for only a tiny fraction of sales in China, which is the company's largest market.

Among Audi models, only the compact A3 is affected in the United States. The A3 accounted for less than a fifth of the 111,000 vehicles that Audi sold in the United States from January through August, and only a fraction of those A3s would have been equipped with diesels.

The E.P.A. said on Friday that Volkswagen would be required to recall the affected vehicles for repairs to make them compliant with smog regulations. Car owners would not have to pay for the repairs. Many owners may not bother, though, because the changes are likely to reduce fuel consumption and performance.

John Schilling, a Volkswagen spokesman, said on Sunday that the company would stop selling 2015 and 2016 Volkswagen and Audi models equipped with the 2-liter diesel engines, which the company had marketed as "clean diesel." The company will also stop selling used cars that have

the engines, Mr. Schilling said.

He said he did not know how many models would be stuck on dealer lots as a result of the decision. This month, Volkswagen had said that 23 percent of new cars sold in August in the United States were diesels, or 7,400 vehicles. Some diesels, such as those used in Volkswagen S.U.V.s, are not affected by the E.P.A. action.

Faulty Tests Cost VW Billions

By FRANK JORDANS and PAN PYLAS, Associated Press

BERLIN (AP) — Around 15 billion euros ($16.9 billion) was wiped off the market value of Volkswagen AG on Monday following revelations that the German carmaker rigged U.S. emissions tests for about 500,000 diesel cars.

By midday trading in Frankfurt, Volkswagen's share price was 19.3 percent lower at a three-year low of 130.20 euros. Its dramatic fall weighed heavily on Germany's main stock index, the DAX, which underperformed its peers in Europe with a 0.6 percent decline.

Volkswagen's market woes Monday follow a weekend that saw the company's reputation for

probity seriously damaged by revelations from the Environmental Protection Agency in the U.S. that it had skirted clean air rules. All told, the EPA indicated that VW faces fines that could run up to more than $18 billion.

The EPA said VW used a device programmed to detect when the cars are undergoing official emissions testing. The software device then turns off the emissions controls during normal driving situations, allowing the cars to emit more than the legal limit of pollutants.

Volkswagen marketed the diesel-powered cars, which account for about 25 percent of sales, as being better for the environment. The cars, built in the last seven years, include the Audi A3, VW Jetta, Beetle, Golf and Passat models.

"The company will have to recall nearly 500,000 affected cars, which will cost it millions of dollars, and that's even before the damage to its brand and potential fines," said Michael Hewson, chief market analyst at CMC Markets.

The agency has ordered VW to fix the cars at its own expense but said car owners do not need to take any immediate action. The EPA insisted that the violations do not pose any safety hazard and said the cars remain legal to drive and sell while Volkswagen comes up with a plan to recall and repair them. However, it said the cars posed a threat to public health.

The EPA also indicated the scale of the fines that could be imposed on VW. It said the carmaker could be hit up to $37,500 per vehicle for the violations — a total of more than $18 billion. The California Air Resources Board is also investigating.

Volkswagen has had a difficult year, its share price having fallen from over 250 euros amid signs of faltering sales in the U.S. and China.

VW edged out Toyota to become the world's top-selling automaker the first half of 2015. But a hit to its reputation from the emissions revelations could hamper its efforts at a sales rebound in the U.S.

If other regulatory authorities decide VW has a case to answer, then the carmaker faces the potential for even bigger fines.

"The news so far revolves around the U.S. impact, but if European investigators become interested the potential penalties could multiply very quickly," said Chris Beauchamp, senior market analyst at IG.

Volkswagen 'sorry,' promises probe on EPA violations

By DANIEL CHAITIN (@DANIELCHAITIN7) • 9/20/15 3:23 PM

Volkswagen apologized Sunday following allegations by the Environmental Protection Agency and the state of California that hundreds of thousands of diesel cars made by the German automaker are breaking emissions laws in the United States.

"The Board of Management at Volkswagen AG takes these findings very seriously," wrote Martin Winterkorn, CEO of Volkswagen. "I personally am deeply sorry that we have broken the trust of our customers and the public. We will cooperate fully with the responsible agencies, with transparency and urgency, to clearly, openly, and completely establish all of the facts of this case. Volkswagen has ordered an external investigation of this matter."

On Friday, the EPA and California charged Volkswagen with willfully installing software in its 4-cylinder diesel cars that would allow cars to bypass emission standards. The cars cited for violations include signature Volkswagen cars manufactured between 2009 and 2015, including the Jetta, Passat, Beetle and Golf, as well as the A3 from Audi, Volkswagen's luxury line.

All together, about 482,000 diesel passenger cars sold in the United States since 2008 are included in the allegations.

The statement promises that Volkswagen will "re-establish trust" it may have lost and that the company will reverse any damage done.

"We do not and will not tolerate violations of any kind of our internal rules or of the law," Winterkorn added.

The EPA issued a notice of violation to Volkswagen, while the state of California sent an In-Use Compliance letter. Both the EPA and the California Air Resources Board are conducting separate investigations into the alleged misbehavior.

Recalls are likely, and the combined fines could add up to $18 billion if the result of the investigations support the allegations.

The EPA alleges that the Volkswagen cars are fitted with software to trick emission testers, but that under normal operation emit nitrogen oxides at up to 40 times the standard. Under the Clean Air Act, such an instrument is classified as a "defeat device."

"Using a defeat device in cars to evade clean air standards is illegal and a threat to public health," said Cynthia Giles, EPA assistant administrator for the Office of Enforcement and Compliance Assurance. "Working closely with the California Air Resources Board, EPA is committed to making sure that all automakers play by the same rules. EPA will continue to investigate these very serious matters."

-

The Epoch Times:

http://www.theepochtimes.com/n3/1755607-volkswagen-circumvents-epa-rule-its-not-the-first-time/

Volkswagen Skirts EPA Rules; It's Not the First Time

By Arleen Richards

Volkswagen Group of America admitted to sidestepping clean air standards after the EPA and California's clean air watchdog confronted the German automaker with evidence of high in-use emissions from light-duty diesels.

On Friday, Sept. 18, the EPA slapped VW with a notice of violation for using sophisticated software to circumvent national emissions standards. The software, which the EPA calls a "defeat device," is designed to implement full emissions control systems when the car is undergoing state emissions testing. During normal driving, the emissions control is turned off, permitting the significantly harmful diesel fumes to be expelled—40 times more than allowed under the Clean Air Act. VW and the California Air Resources Board (CARB) have both initiated investigations.

Volkswagen CEO Dr. Martin Winterkorn, on Sunday, apologized for breaking the public's trust and vowed to cooperate fully with agency investigations.

He ordered an internal investigation, saying in a statement, "We do not and will not tolerate violations of any kind of our internal rules or of the law."

But this episode is not the first time the EPA or CARB has had run-ins with VW. In the past, both agencies charged VW with similar violations, which resulted in penalties.

Defective Oxygen Sensors

VW previously failed to report its discovery of emission defects in at least 329,000 of its 1999,

2000, and 2001 Golf, Jetta, and New Beetle vehicles.

In May 2001, after conducting a random test, the EPA identified a problem with tailpipe emissions in the 1999 model vehicles caused by a failed oxygen sensor. It turns out, VW knew about the problem for a year already—since it had received numerous warranty claims associated with cracked oxygen sensors—but failed to report it. According to the Clean Air Act, any emission-related defect found in 25 vehicles or engines of the same model year has to be reported within 15 days.

VW spent $26 million in January 2002 to recall all the vehicles and replace or repair the part. Another estimated $660,000 was spent on an enhanced defect tracking system.

The EPA finally settled its case with VW in 2005, penalizing the delinquent car maker $1.1 million.

The state of California has been working closely with the EPA in testing VW cars and issued a separate notice of violation to VW in the current case.

California has been a leader in clean energy investments and set the stage in 2006 for transitioning to a sustainable, low-carbon future with the passage of AB 32, a law requiring sharp reduction in greenhouse gases. Since then, several legislative initiatives have been implemented to build the next generation of clean, fuel-efficient cars.

The CARB implements the state's vehicle regulations through a vigorous certification process, as well as compliance and enforcement programs. It regularly tests vehicles to ensure compliance with air quality standards.

In 2004, VW settled a case with CARB for $552,500 for selling cars in California that had not been properly certified. VW admitted to selling 84 new 2002 vehicles from several retail locations throughout the state, attributed to an error in its electronic ordering system.

The EPA is expected to compel VW to issue a recall notice in order to remedy the current emissions problem, which could take up to a year after identifying the appropriate corrective action and a recall plan.

Jalopnik:

http://jalopnik.com/volkswagen-tells-dealers-to-halt-sales-of-new-tdi-cars-1731923302

Volkswagen Tells Dealers To Halt Sales Of New TDI Cars Amid Diesel Cheating Scandal

Alanis King

Following the government investigation of Volkswagen's diesel emissions, The Detroit News reports the automaker ordered its U.S. dealerships to halt sales of new 2016 and remaining 2015 TDI car models with 2.0-liter diesel engines.

According to the Environmental Protection Agency and California Air Resources Board, VW dodged federal emissions requirements for some 482,000 of its diesel cars — including the Passat, Jetta, Golf, Beetle, SportWagens and Audi A3 — manufactured from 2009 to 2015. The models contain a "defeat device" which exists to detect when the car is under testing conditions, allowing for it to activate the full emissions-control systems only in those circumstances.

In other words, environmental officials say that the street cars are emitting between 10 and 40 times the amount of allowable nitrogen oxide pollution, which is not only illegal but harmful to both the environment and public.

The EPA is taking action on 2016 diesel models. Christopher Grundler, director of the EPA Office of Transportation of Air Quality, said that the government will not grant VW a "certificate of conformity" to sell the 2016 models with 2.0-liter diesel engines, meaning they cannot be sold.

VW dealers have been waiting for the 2016 models to replenish showrooms. Most U.S. VW dealers don't have any remaining 2015 diesel cars to sell.

VW is barred from selling 2016 model vehicles with the 2.0 liter diesel engine until "they get answers to the questions of how these vehicles are being operated. Volkswagen couldn't explain why we're getting these excess emissions," Grundler said.

Meanwhile, whatever 2015 models remain on lots have also been ordered not to be sold. As Automotive News notes, four-cylinder TDI models account for 20 to 25 percent of VW's U.S. sales, so this is going to hurt.

In addition, VW has ordered an outside investigation to find out what happened and "reverse the damage this has caused," CEO Martin Winterkorn said in an apologetic statement.

According to the EPA, the agency is now checking to see if other automakers are bypassing the laws on diesel engines as well.

While no official recall is underway just yet, the News reports:

EPA said VW violated federal law and, in theory, could face fines of up to $18 billion — $37,500 per vehicle — as well as criminal prosecution. Both agencies issued notices of non-compliance to VW Friday, a step necessary before ordering a recall.

The EPA will not take action to stop VW owners from driving their personal cars until a solution is made available, but VW did remove its "clean diesel" advertisements from YouTube and television.

CBC News (Canada):

http://www.cbc.ca/news/business/volkswagen-emissions-rigging-1.3236548

Volkswagen shares plunge on emissions rigging scandal

Consumer Reports suspends 'recommended' rating for Jetta and Passat diesels

CBC News Posted: Sep 21, 2015 9:00 AM ET Last Updated: Sep 21, 2015 9:00 AM ET

Volkswagen's CEO apologized but investors were not in a forgiving mood as the company's stock plunged almost 20 per cent Monday following revelations late last week that the automaker had rigged emissions tests for almost 500,000 diesel cars in the U.S.

"I personally am deeply sorry that we have broken the trust of our customers and the public," Martin Winterkorn said in a weekend statement.

On Friday, the U.S. Environmental Protection Agency (EPA) revealed that half a million diesel-powered VWs had been programmed to bypass emission controls except during emissions tests. The cars include the Audi A3, VW Jetta, Beetle, Golf and Passat models made in the last seven years.

The EPA ordered VW to fix the cars and VW said it would co-operate with regulators. But the damage to the automaker's image is nothing less than catastrophic.

VW had marketed its diesel-powered cars as being better for the environment. The Associated Press reports, citing an anonymous source with knowledge of the matter, that VW has told dealers to stop selling its 2015 diesel cars with 2.0-litre engines.

The EPA said the VW cars under investigation seemed to pass emissions tests, but in the real world, were actually emitting up to 40 times the national standard for nitrogen oxide, which is

linked to asthma and lung illnesses.

Consumer Reports announced it would remove its "recommended" rating from the Jetta and Passat diesels until it can retest the vehicles.

VW could face fines of up to $18 billion US, according to the EPA.

Volkswagen shares plunged 19.4 per cent in Monday trading in Germany, chopping $21 billion Cdn from the market value of the company.

"The company will have to recall nearly 500,000 affected cars, which will cost it millions of dollars, and that's even before the damage to its brand and potential fines," said Michael Hewson, chief market analyst at CMC Markets.

Diesel-powered models account for about a quarter of VW's sales.

Impact in Canada unclear

At this point, it isn't clear what the revelations mean for owners of VW diesels in Canada. Volkswagen Canada told CBC News on Friday that it first learned of the EPA action earlier that morning. It said it would co-operate with Environment Canada "to understand the implications for the Canadian market and what actions, if any, may be required in Canada."

Environment Canada, for its part, said it was in talks with the EPA "to further examine this issue and assess potential implications for Canada." Environment Canada also said it collaborates on emissions verification activities with the U.S. EPA "to ensure our common environmental outcomes are achieved," and pointed out that its emissions standards are aligned with U.S. standards.

The EPA and Environment Canada both stressed that the effectiveness of a vehicle's air pollutant control devices is not a safety issue. The cars remain legal to drive.

http://www.nytimes.com/2015/09/21/business/international/volkswagen-chief-apologizes-for-breach-of-trust-after-recall.html?_r=0

Volkswagen to Stop Sales of Diesel Cars Involved in Recall

By JACK EWING and CORAL DAVENPORTSEPT. 20, 2015

FRANKFURT — Volkswagen said on Sunday that it would halt sales of cars in the United States equipped with the kind of diesel motors that had led regulators to accuse the German company of illegally installing software to evade standards for reducing smog.

John Schilling, a Volkswagen spokesman, said that the company would stop selling 2015 and 2016 Volkswagen and Audi models equipped with 4-cylinder turbo diesel engines, which the company has marketed as "clean diesel." The company will also stop selling used cars that have the engines, Mr. Schilling said.

He said he did not know how many models would be stuck on dealer lots as a result of the decision. Earlier this month, Volkswagen had said that 23 percent of new cars sold in August in the United States were diesels, or 7,400 vehicles.

The confirmation of the halt in sales came on the same day that Martin Winterkorn, the chief executive of Volkswagen, apologized for conduct that prompted the Environmental Protection Agency to order Volkswagen to recall nearly half a million vehicles.

An employee on the Audi A3 limousine. The recall involves four-cylinder Volkswagen and Audi vehicles from the model years 2009 to 2015. Credit Szilard Koszticsak/European Pressphoto Agency

Volkswagen could face billions of dollars in fines for what the E.P.A. said was a deliberate attempt to evade rules on emissions. The decision to stop sales was first reported by The Wall Street Journal.

"I personally am deeply sorry that we have broken the trust of our customers and the public," Mr. Winterkorn said in a statement.

He said the company would "cooperate fully" with the authorities and order its own independent investigation into the accusations.

In his statement, Mr. Winterkorn did not contest assertions by the E.P.A. that Volkswagen sold cars equipped with software that could detect when periodic state government emissions testing was taking place.

Only during such tests are the cars' full emissions control systems turned on. During normal driving situations, the controls were turned off, allowing the cars to spew as much as 40 times the pollution allowed under the Clean Air Act, the E.P.A. said.

Diesel-driven cars have enjoyed something of a renaissance in recent years, shedding much of their old stigma for being dirty, clanky and sluggish to drive, said Karl Brauer, an analyst at Kelley Blue Book. And in the United States, he said, Volkswagen has clearly led the pack — offering diesel vehicles that performed just like their gasoline counterparts.

"Now, we have to wonder if the technology really advanced as far as we thought at VW," Mr. Brauer said. "They must have had a problem making it work in a way that delivered truly clean diesel. At least clean enough to meet the regulations."

Mr. Brauer said the higher nitrous oxide emissions probably allowed better drivability. Fuel economy also improves with more nitrous emissions, and engines can run cooler, and thus wear out more slowly.

"They must have had a mix of performance, economy and durability that they liked, but realized they couldn't achieve that and still get the emissions," he said.

Diesels in particular are known — and marketed — these days as having tremendous torque, or low-end thrust from a stop. If achieving the required emissions affected the torque, making it anemic, then "drivers are going to scratch their heads, thinking, isn't this why I got a diesel?" Mr. Brauer said.

Volkswagen was going through a difficult period even before the accusations became public on Friday. Mr. Winterkorn recently survived a power struggle with the chairman of Volkswagen's supervisory board, Ferdinand Piëch, a scion of the Porsche family who dominated the company for more than two decades before resigning in April.

Following Mr. Piëch's departure, some analysts have raised questions about whether Mr. Winterkorn would be strong enough to hold together the sprawling Volkswagen empire, which also includes Audi and Bentley luxury cars, Porsche and Lamborghini sports cars, Scania and MAN heavy trucks, and Ducati motorcycles.

Although Volkswagen recently surpassed Toyota as the world's biggest automaker measured by the number of cars sold, it is significantly less profitable than its Japanese rival and far weaker in the United States market.

A push by Volkswagen to increase sales in the United States, which included building a factory in Chattanooga, Tenn., to produce Passat sedans, has fallen short.

"For Volkswagen, it's a huge scandal," said Ferdinand Dudenhöffer, a professor at the University of Duisburg-Essen, who follows the automobile industry. "The timing is extremely unfortunate."

Professor Dudenhöffer said the case could damage all German automakers, which have tried to build acceptance in the United States for diesel engines, a sector in which they believe they have a technological lead.

Until recently, Professor Dudenhöffer said, the United States applied stricter standards to diesel engines than those applied by European regulators. But the European authorities, concerned about the health effects of diesel pollution, have tightened standards, prompting complaints from the auto industry.

Professor Dudenhöffer said that as a result of the E.P.A. action, Mr. Winterkorn could come under pressure to resign.

"Winterkorn was already damaged," Professor Dudenhöffer said. "Now there is an accusation of illegal behavior. This story is not over."

E.P.A. officials issued the car company a notice of violation and said it had admitted to the use of a so-called defeat device.

The recall involves 4-cylinder Volkswagen and Audi vehicles from the model years 2009 to 2015.

The software was designed to conceal the cars' emission of nitrogen oxide, a pollutant that contributes to the creation of ozone and smog, which are linked to a range of health problems,

including asthma attacks, other respiratory diseases and premature death.

Disengaging the pollution controls on a diesel-fueled car can yield better performance, including increased torque and acceleration.

California has issued a separate notice of violation to the company. California, the E.P.A. and the Justice Department are working together on an investigation of the allegations.

Over the next year, E.P.A. officials said, owners of the affected vehicles should expect to receive recall notices from Volkswagen, including information about how to get their cars repaired at no cost to them. The recall covers roughly 482,000 diesel passenger cars sold in the United States since 2009.

Affected diesel models include the 2009-15 Volkswagen Jetta, 2009-15 Beetle, 2009-15 Golf, 2014-15 Passat and 2009-15 Audi A3.

The American investigation could ultimately result in fines or penalties for the company. Under the terms of the Clean Air Act, the Justice Department could impose fines of as much as $37,500 for each recalled vehicle, for a possible total penalty of as much as $18 billion.

The notice of violation came days after the company promoted plans at the Frankfurt International Motor Show to introduce 20 plug-in hybrid or all-electric vehicles by 2020 as part of a campaign to reduce vehicle emissions.

Mr. Winterkorn said in his statement on Sunday that Volkswagen would "do everything necessary in order to reverse the damage this has caused."

"This matter has first priority for me, personally," he said, "and for our entire board of management."

VW apologises for cheating US car exhaust emissions tests

Andy Sharman in London

The chief executive of Volkswagen has apologised and ordered an external investigation into findings that the carmaker cheated on US emissions tests to make its vehicles appear less polluting.

In a statement on Sunday, Martin Winterkorn, chief executive of the German carmaker, said the board of management took the findings "very seriously".

He added: "I personally am deeply sorry that we have broken the trust of our customers and the public. We will co-operate fully with the responsible agencies, with transparency and urgency, to clearly, openly and completely establish all of the facts of this case."

The Environmental Protection Agency on Friday said diesel variants of several VW and Audi models sold in the US over six years — including the VW Passat, Beetle and Audi A3 — had been fitted with sophisticated algorithms designed to deceive the laboratory testing regime.

The authorities ordered VW to recall 482,000 cars because of the use of so-called defeat devices — which use software to detect when the car is being tested and runs treatments to reduce nitrogen oxides. Once out on the road, the cars were discovered to produce pollutants up to 40 times the legal limits.

The discovery leaves the German carmaker — which has admitted to using the defeat devices — potentially facing billions of dollars in fines and warranty costs, possible criminal charges for executives and class-action lawsuits from US drivers.

Mr Winterkorn did not say who would be carrying out the external investigation, and the company declined to provide further details.

It was Mr Winterkorn's first formal statement on an issue that also threatens to seriously undermine its attempts to turnround its sputtering performance in the US.

Max Warburton, analyst at Bernstein Research, said: "The best case for VW is probably still a multibillion-dollar fine, pariah status in the US with government — and possibly consumers — [and] damage to its leading position in diesel in the US."

VW now has to initiate a process to fix the cars' emissions systems, though the EPA has said the violations do not present a safety hazard and the vehicles remain legal to drive and resell. Owners of cars of models covering the 2009-2015 period do not need to take any action, the agency said.

I personally am deeply sorry that we have broken the trust of our customers and the public. We will co-operate fully with the responsible agencies, with transparency and urgency, to clearly, openly, and completely establish all of the facts of this case

- Martin Winterkorn, VW chief

In addition to the costs of the recall campaign, VW could theoretically also face fines of up to $37,500 per vehicle — a total of more than $18bn — though analysts have said VW is likely to face a much lower penalty.

The case is a rare but not unique example of this type of manipulation by the motor industry. In 1998, a group of truckmakers including Navistar, Renault and Volvo paid more than $1bn to resolve claims they installed defeat devices on heavy duty diesel engines. These devices allowed

an engine to pass the emissions test, but then turn off emission controls when on the road, the EPA said at the time.

The EPA has been active in the past year, securing a record $300m settlement with Hyundai and Kia over claims the Korean affiliates overstated the fuel economy of their cars.

http://www.theguardian.com/business/2015/sep/20/vw-software-scandal-chief-apologises-for-breaking-public-trust

VW software scandal: chief apologises for breaking public trust

Martin Winterkorn orders external investigation after US regulators found cars gave inaccurate data on toxic emissions

Volkswagen has ordered an external investigation after US regulators found that the carmaker designed software for close to half a million diesel cars that gave false emissions data, its CEO said, adding he was "deeply sorry" for the violation of US rules.

"I personally am deeply sorry that we have broken the trust of our customers and the public," Martin Winterkorn said in a statement published on Sunday by the carmaker on Sunday. "Volkswagen has ordered an external investigation of this matter."

The US Environmental Protection Agency (EPA) said on Friday the software deceived regulators measuring toxic emissions, adding that Volkswagen could face fines of up to $18bn (£11.5bn) as a result. The carmaker could face penalties of $37,500 for each car not in compliance with clean air rules. The diesel-powered models from 2009-2015 are the VW Jetta, Beetle and Golf, the Passat model from 2014-15, and the Audi A3 from 2009 to 2015.

"We do not and will not tolerate violations of any kind of our internal rules or of the law," said Winterkorn, adding the company was fully co-operating with the relevant agencies. He gave no details on who would carry out the external investigation.

Cynthia Giles, an enforcement officer at the EPA, said on Friday that the cars in question "contained software that turns off emissions controls when driving normally and turns them on when the car is undergoing an emissions test".

"VW was concealing the facts from the EPA, the state of California and from consumers. We expected better from VW," she said. "Using a defeat device in cars to evade clean air standards is illegal and a threat to public health."

The EPA accused Volkswagen of using the device in 482,000 four-cyclinder Volkswagen and Audi diesel cars in the US since 2008. VW must recall all the cars, remove the defeat device and improve the cars' NOx emissions, which creates smog and has been linked to increased asthma attacks and other respiratory illnesses.

The feature, which the EPA called a defeat device, masks the true emissions only during testing and therefore when the cars are on the road they emit as much as 40 times the level of pollutants allowed under clean air rules meant to ensure public health is protected, said Giles.

Volkswagen suspended sales of cars containing the company's four-cylinder turbo direct injection (TDI) engine on Friday in light of the investigation. The "clean diesel" engine is commonly used in models including VW's Beetle, Golf, Jetta, Passat and the A3 luxury compact made by VW-owned Audi.

Richard Corey, executive officer of the California Air Resources Board (Carb), said on Friday: "Our goal now is to ensure that the affected cars are brought into compliance, to dig more deeply into the extent and implications of Volkswagen's efforts to cheat on clean air rules, and to take appropriate further action."

The EPA and Carb discovered the defeat device software following independent analysis by

researchers at West Virginia University, who were promoted into action by the International Council on Clean Technology, an NGO.

When confronted with the EPA and Carb's evidence, VW admitted that its cars were fitted with the defeat device.

The crackdown on Volkswagen comes as the Obama administration is attempting to cut air pollution from an array of sources, including the vehicle industry, power plants and oil and natural-gas providers. The EPA set new carbon rules for big trucks earlier this year and has told all vehicle makers they must sell light vehicles averaging 54.5 miles a gallon by 2025.

In Europe, new laws have forced manufacturers to test their cars under real world conditions and not in laboratories, helping to reduce unrealistic claims about emissions. By 2017 all new cars will have to be more stringently tested, effectively ending an era when car makers could exaggerate the performance of their machines.

UK car industry group the SMMT claims that, because of European legislation to cut tailpipe pollution, Britain's air quality is better now than it has been for centuries.

Volkswagen head apologizes after EPA accusations

By Timothy Cama - 09/20/15 01:28 PM EDT

The head of German automaker Volkswagen Group apologized Sunday after allegations surfaced that his company deliberately tried to evade United States air pollution laws.

Martin Winterkorn, the company's chief executive officer, said he was "deeply sorry" for violating the trust of customers and the public, and said that Volkswagen had ordered an external investigation into the matter.

Volkswagen faces up to $18 billion in fines for the violations under the Clean Air Act, under which the Environmental Protection Agency (EPA) sets air pollution rules for motor vehicles.

"We will cooperate fully with the responsible agencies, with transparency and urgency, to clearly, openly, and completely establish all of the facts of this case," Winterkorn said in a Sunday statement

"We do not and will not tolerate violations of any kind of our internal rules or of the law."

Winterkorn stopped short of admitting to the EPA's allegations.

On Friday, the EPA said it had discovered that about 482,000 diesel vehicles sold by VW and its subsidiary Audi in the United States had "defeat devices" that detect when the vehicle is undergoing an EPA emissions test and turn on equipment that controls output of nitrogen oxides to acceptable levels.

At all other times, the EPA said, the vehicles emitted more pollutants, sometimes exceeding allowable volumes by 40 times.

The agency has not yet officially charged Volkswagen with any civil or criminal penalties, nor did it order any recalls of the affected vehicles. California, which has its own emissions regulations, is also accusing the company of violating air rules.

"We at Volkswagen will do everything that must be done in order to re-establish the trust that so many people have placed in us, and we will do everything necessary in order to reverse the damage this has caused," Winterkorn said, adding that the issue is the top priority for him and the entire management team.

Volkswagen could face $18 billion penalties from EPA

WASHINGTON | BY TIMOTHY GARDNER

Volkswagen AG could face penalties up to $18 billion after being accused of designing software for diesel cars that deceives regulators measuring toxic emissions, the U.S. Environmental Protection Agency said on Friday.

"Put simply, these cars contained software that turns off emissions controls when driving normally and turns them on when the car is undergoing an emissions test," Cynthia Giles, an enforcement officer at the EPA, told reporters in a teleconference.

Volkswagen can face civil penalties of $37,500 for each vehicle not in compliance with federal clean air rules. There are 482,000 four-cylinder VW and Audi diesel cars sold since 2008 involved in the allegations. If each car involved is found to be in noncompliance, the penalty could be $18 billion, an EPA official confirmed on the teleconference.

A U.S. Volkswagen spokesman said the company "is cooperating with the investigation; we are unable to comment further at this time."

The feature in question, which the EPA called a "defeat device," masks the true emissions only during testing and therefore when the cars are on the road they emit as much as 40 times the level of pollutants allowed under clean air rules meant to ensure public health is protected, Giles said.

The EPA accused Volkswagen of using software in four-cylinder Volkswagen and Audi diesel cars from model years 2009 to 2015 made to circumvent emissions testing of certain air pollutants.

The cars are not facing recall at this time, the EPA said.

The diesel-powered vehicles involved from the 2009 to 2015 model years are the VW Jetta, VW Beetle, VW Golf and the Audi A3, as well as the VW Passat from model years 2014 and 2015.

Christian Post:

http://www.christianpost.com/news/volkswagen-to-recall-almost-500000-cars-in-the-us-over-epa-violation-145778/

Volkswagen to recall almost 500,000 cars in the US over EPA violation

BY LORRAINE CABALLERO , CHRISTIAN POST CONTRIBUTOR

Volkswagen will recall almost 500,000 vehicles released from 2009 to 2015 in the United States after the carmaker allegedly violated the law by using illegal software, which helped it go past environmental restrictions.

The Environmental Protection Agency (EPA) said Volkswagen broke the law by installing a "defeat device" in Volkswagen and Audi units with four-cylinder turbo diesel engines released from the year 2009 to 2015. Under normal driving conditions, the emission control devices installed in the said cars worked with reduced efficacy, according to the Dispatch Times.

In the wake of the violation, Volkswagen chief executive Martin Winterkorn delivered a statement apologizing to their customers and vowing to cooperate with EPA's investigation. However, he did not deny the allegations regarding the illegal software, the International Business Times reports.

"I personally am deeply sorry that we have broken the trust of our customers and the public," said Winterkorn in his statement.

Because of the notice of violation from the EPA, Volkswagen is now facing penalties amounting to more than $18 billion, or around $37,500 per unit, based on the U.S.A. federal Clean Air Act. EPA and CARB discovered the illegal software after researchers at the West Virginia University conducted an independent study in cooperation with the global Council on Clean Transportation, the report adds.

Volkswagen has been struggling to sell cars in the United States because of the rising cases of asthma and other respiratory illnesses caused by air pollutants. The diesel vehicles affected by the recall were being counted on to pull up the company's sales in the United States.

Based on the findings of the EPA, Volkswagen had included a certain algorithm in the cars' emissions software that could detect when an emission test is being conducted.

Owners of the diesel cars affected by the recall will be notified by Volkswagen by next year, EPA said. Until Consumer Reports can "retest" the said cars, the recommended rating for the Passat, Jetta, Golf, Beetle, and Audi A3 luxury compact will remain on hold, the report relays.

AP (via Boston Globe):

https://www.bostonglobe.com/business/2015/09/20/chief-sorry-after-epa-says-firm-skirted-clean-air-law/3NNTCf2cVxUI1qYNBfMe7L/story.html

Volkswagen chief apologizes for rigging tests of emissions

By Paul Wiseman and Tom Krisher ASSOCIATED PRESS SEPTEMBER 21, 2015

WASHINGTON — The chief executive of Volkswagen apologized Sunday and VW customers said they felt duped after the Environmental Protection Agency revealed that the German automaker had skirted clean air rules by rigging emissions tests for about 500,000 diesel cars.

''I personally am deeply sorry that we have broken the trust of our customers and the public,'' Volkswagen chief Martin Winterkorn said in a statement. He said VW has ordered an investigation and promised that the company would cooperate with regulators.

On Friday, the EPA said VW used software that allowed its diesel cars to release fewer smog-causing pollutants during tests than in real-world driving conditions.

The cars, built in the last seven years, include the Audi A3, VW Jetta, Beetle, Golf, and Passat models. The agency ordered VW to fix the cars at its own expense. VW also faces fines that could add up to billions of dollars.

VW edged out Toyota to become the world's top-selling automaker in the first half of 2015. But a hit to its reputation from the emissions revelations could hamper its efforts at a sales rebound in the United States. Between 2013 and 2014, VW sales plummeted 10 percent, even as overall industry sales rose 6 percent. US buyers want SUVs, and Volkswagen doesn't have competitive vehicles to offer them.

The magazine Consumer Reports almost immediately suspended its ''recommended'' rating on the Jetta and Passat diesels until it can get recall repairs and retest the cars.

Volkswagen marketed the diesel-powered cars, which account for about 25 percent of its sales, as being better for the environment. After the EPA acted, VW withdrew ads for its diesel cars from Youtube.com and asked dealers to stop selling 2015 diesel cars with 2.0-liter engines, according to a person familiar with the matter.

Some VW customers were furious.

Zeeshan Shah, 39, of Fulton, Md., said that he bought a Volkswagen Diesel Passat 2015 in July after he totaled his Jetta two years ago.

''The selling point" for the Diesel Passat was that the technology was so good, he said. Now, Shah plans to return the car back to the dealer to have it examined and doesn't want to buy another Volkswagen. ''Once they cheat you on this issue, what other issues can they cheat you on?'' he said. ''You don't trust them.''

John German, senior fellow at the International Council on Clean Transportation, the group that blew the whistle on VW, said it didn't expect to find any violators when it contracted with West Virginia University to test cars with diesel engines.

The council, a research group that helps governments write regulations, did the US tests in an effort to show that automakers were complying with US nitrogen oxide emissions standards,

which are stricter than in other countries, he said.

The EPA said VW faces fines of up to $37,500 per vehicle for the violations, a total of more than $18 billion.

Volkswagen Halts U.S. Sales of Certain Diesel Cars

Auto maker also begins external probe after EPA accuses company of dodging emissions rules

By WILLIAM BOSTON, AMY HARDER and MIKE SPECTOR

Updated Sept. 20, 2015 8:57 p.m. ET

Volkswagen AG's crisis over allegedly cheating on U.S. emissions tests deepened, with the German auto maker halting American sales of popular diesel-powered cars and issuing a sweeping apology for violating customers' trust.

It also launched an external investigation. Shares in the company slumped more than 20% in early trading Monday in response to the crisis.

The company could face billions of dollars in fines and the crisis could further weaken Volkswagen Chief Executive Martin Winterkorn's position. He narrowly survived efforts by a major shareholder to oust him earlier this year and was passed over for the chairman's job, the company's top post, this month.

"I personally am deeply sorry that we have broken the trust of our customers and the public,"

Mr. Winterkorn said in a statement issued by the company on Sunday, adding that VW is cooperating with authorities and has commissioned an external probe.

The U.S. is crucial in Volkswagen's efforts to become the world's leading auto maker by sales. The German company has built its campaign to grow in the U.S. market on a promise that its clean-diesel engines deliver better performance and low emissions. It is neck-and-neck with reigning sales leader Toyota Motor Corp. and overtook the Japanese car maker during the first half of this year. But the emissions test probes could stall its progress.

Even prior to the emissions issue, the auto maker's namesake Volkswagen brand has been battling declining sales in the U.S. market. And Audi AG, its luxury car maker, is finding it hard to catch up in the U.S. with rivals BMW AG and Daimler AG, which makes Mercedes-Benz vehicles.

On Friday, the U.S. Environmental Protection Agency and the California Air Resources Board alleged that Volkswagen used software, dubbed a "defeat device," in the cars to make diesel-powered engines appear to have lower levels of emissions than they actually did.

About 482,000 Volkswagen diesel-powered cars were affected.

The EPA probe could force Volkswagen and its Audi unit to recall thousands of vehicles that contain the company's "clean diesel" engines. The four-cylinder 2.0-liter turbo direct injection, or TDI, engine is commonly found in Volkswagen's Passat, Jetta, Golf, Beetle and in Audi's A3 luxury compact model.

A Volkswagen spokesman on Sunday said the auto maker halted the sale of all 2015 and 2016 models containing the four-cylinder 2.0 liter TDI engine. The EPA investigation affects cars sold since 2008. The company hasn't issued a recall, the spokesman said.

Realization that Volkswagen may have cheated to get better emissions results could undermine its U.S. recovery and further weaken its shares, which are down 37% from their peak on March 16, said analysts.

"There is no way to put an optimistic spin on this—this is really serious," said Max Warburton, an analyst with Bernstein Research. "The best case for VW is probably still a multi-billion dollar fine."

Consumer Reports, an influential magazine when it comes to car reviews, last week suspended "recommended" ratings on the auto maker's Jetta and Passat diesel-engine models after the EPA disclosed its allegations. Consumer Reports said the recommendations would be suspended until it can retest the vehicles once they are repaired. The magazine said it would then assess whether the cars' fuel economy worsened.

A production line at a Volkswagen plant in Wolfsburg, Germany. ENLARGE

A production line at a Volkswagen plant in Wolfsburg, Germany. PHOTO: REUTERS

Laurie Cleveland, a 54-year-old English teacher from Lowville, N.Y., said she bought a new 2015 VW Passat TDI over the Labor Day weekend. She isn't sure what to do now. She said it is her fourth Volkswagen diesel car since 2006.

"I feel like I've been deceived," she said. "I'm a person who likes to be environmentally friendly," she added.

Mr. Winterkorn on Sunday vowed to do "everything necessary" to regain public trust in the company.

"We do not and will not tolerate violation of any kind of our internal rules or of the law," he said. "This matter has first priority for me."

U.S. officials said Volkswagen violated two parts of the federal Clean Air Act and could face fines of as much as $37,500 per car, or more than $18 billion. It remained unclear whether the government would seek such an onerous penalty.

The EPA in November 2014 hit South Korean auto makers Hyundai Motor Co. and Kia Motors Corp. with a record $100 million penalty for overstating fuel-economy claims and forced the companies to cough up another $200 million in regulatory credits.

The EPA has said the vehicles remain safe and legal to drive. The agency is working with the Justice Department and an investigation is continuing.

Officials alleged that Volkswagen used software that activates full emissions controls only during testing but then reduces their effectiveness during normal driving. The result is that cars can emit nitrogen oxides at up to 40 times the allowable standard, the agency said. Diesel-powered cars are a small part of overall U.S. car and light-truck sales.

Experts say that the software enables cars to get better fuel economy at the expense of higher nitrogen-oxide emissions, which was likely one reason VW was using them, according to Margo Oge, who recently retired as director of the EPA's Office of Transportation and Air Quality after more than 30 years at the agency.

Volkswagen's apparent motivations on the emissions tests were unclear. An EPA spokeswoman has said it would be "premature to speculate on why VW did this."

A Volkswagen spokesman in Wolfsburg, Germany, on Sunday said, "We are now in the investigation phase and have no comment beyond what is in the statement that we published today."

California is separately investigating the auto maker.

The International Council on Clean Transportation, a nonprofit research organization that works with governments to cut air pollution from mobile sources, and West Virginia University researchers uncovered Volkswagen's alleged use of defeat devices in research and testing over the last couple of years.

Volkswagen to halt U.S. sales of some 2015 diesel cars

FRANKFURT/HAMBURG | BY CHRISTOPH STEITZ AND JAN SCHWARTZ

Volkswagen (VOWG_p.DE) told U.S. dealers to halt sales of some 2015 diesel cars after regulators found software it designed for the affected vehicles gave false emissions data, the company said Sunday, announcing it had launched an investigation.

In a statement published by the carmaker on Sunday, Chief Executive Officer Martin Winterkorn said, "I personally am deeply sorry that we have broken the trust of our customers.

"Volkswagen has ordered an external investigation of this matter," he said.

The U.S. Environmental Protection Agency (EPA) said on Friday the software deceived regulators measuring toxic emissions, adding that Volkswagen could face fines of up to $18 billion as a result.

The Detroit News reported late Friday that VW dealers still had some 2015 diesel Jetta, Passat and Beetle cars for sale.

A VW representative on Sunday confirmed the partial halt of sales of the affected vehicles but did not give any numbers.

Winterkorn said, "We do not and will not tolerate violations of any kind of our internal rules or of the law," adding that the company was fully cooperating with the relevant agencies.

He gave no details on who would carry out the external investigation.

"This is not your usual recall issue, an error in calibration or even a serious safety flaw," Bernstein analysts wrote in a note on Sunday. "There is no way to put an optimistic spin on this - this is really serious."

Cynthia Giles, an enforcement officer at the EPA, said on Friday the cars in question "contained software that turns off emissions controls when driving normally and turns them on when the car is undergoing an emissions test".

The feature, which the EPA called a "defeat device," masks the true emissions only during testing. When the cars are on the road, they emit as much as 40 times the level of pollutants allowed under clean air rules meant to ensure public health is protected, Giles said.

"We have admitted to it to the regulator. It is true. We are actively cooperating with the regulator," a Volkswagen spokesman said on Sunday.

Volkswagen could face civil penalties of $37,500 for each vehicle not in compliance with federal clean air rules. Some 482,000 four-cylinder VW and Audi diesel cars sold since 2008 are involved in the allegations.

If each car involved is found to be in noncompliance, the penalty could be $18 billion, an EPA official confirmed during the telephone conference on Friday.

Volkswagen peer Daimler, meanwhile, signaled it may not be subject to the same violation.

"I have a rough idea of what is happening and that it does not apply to us," Daimler Chief Executive Dieter Zetsche said on Sunday at an event in Hamburg.

"But it is much too early to make a final statement on this," he added.

-

USA Today:

Volkswagen issues sales halt; CEO apologizes on emissions cheating

Nathan Bomey, USA TODAY 8:02 a.m. EDT September 21, 2015

Volkswagen has admitted cheating U.S. diesel emissions tests, sending company shares plunging as much as 23 percent in Frankfurt and potentially leaving the company open to billions of dollars in fines. Bloomberg

Martin Winterkorn ordered an external investigation after the EPA disclosed the violations.

Volkswagen's CEO said he is "deeply sorry" for violating U.S. emissions standards and ordered an external investigation Sunday, two days after the Environmental Protection Agency (EPA) accused the automaker of purposefully manipulating emissions tests for almost 500,000 vehicles.

The German automaker ordered its U.S. dealerships to stop selling cars impacted by the probe until its engineers can deliver a fix.

The EPA accused Volkswagen of installing software on 482,000 diesel cars in the USA that allowed it to cheat emissions tests, potentially exposing people to harmful pollutants at levels of 40 times the acceptable standard and respiratory conditions such as asthma.

"I personally am deeply sorry that we have broken the trust of our customers and the public," Martin Winterkorn, Volkswagen's CEO, said in a statement. "We will cooperate fully with the responsible agencies, with transparency and urgency, to clearly, openly and completely establish all of the facts of this case." Winterkorn pledged to regain the public's trust.

The violations could expose Volkswagen — the world's largest vehicle manufacturer through the first six months of 2015 — to up to $18 billion in federal fines if the EPA assesses the maximum possible penalty of $37,500 per vehicle.

The violations could invite charges of false marketing by regulators, a vehicle recall and payment to car owners, either voluntarily or through lawsuits. Volkswagen advertised the cars under the "Clean Diesel" moniker.

The state of California is investigating the emissions violations.

"We do not and will not tolerate violations of any kind of our internal rules or of the law," Winterkorn said. The company's board takes the allegations "very seriously," he said.

The EPA accused the German automaker of adopting what it called a "defeat device" to trick U.S. regulators into believing its cars met Clean Air Act standards for nitrogen oxides. Volkswagen admitted to investigators it had installed the defeat device, the EPA said.

The EPA said impacted cars include the 2009 to 2014 Volkswagen Jetta, Beetle and Golf, the 2014 and 2015 Volkswagen Passat and the 2009 to 2015 Audi A3.

Volkswagen told dealers they cannot sell the 4-cylinder diesel versions of those cars until a fix is available, Volkswagen spokesman Mario Guerreiro said Sunday.

The sales halt could put a significant dent in the company's September sales performance. About 20% of Volkswagen's vehicle sales are diesel engines, said AutoPacific analyst Dave Sullivan.

"It totally goes against all of the marketing they have had of a clean diesel," Sullivan said of the violations. "That's one of the biggest selling points for Volkswagen."

"The trust of our customers and the public is and continues to be our most important asset," Winterkorn said Sunday. "We at Volkswagen will do everything that must be done in order to re-establish the trust that so many people have placed in us, and we will do everything necessary in order to reverse the damage this has caused. This matter has first priority for me, personally, and for our entire Board of Management."

Regulators order Volkswagen recalls over device used to trick smog tests

BY DALE KASLER

In a joint probe with California air regulators, the federal government Friday told Volkswagen to

recall 480,000 diesel-fuel cars, charging the automaker with equipping the cars with software designed to circumvent pollution limits.

The U.S. Environmental Protection Agency and California Air Resources Board sent notices to the German automaker over its alleged use of something called a "defeat device," a piece of software that controls emissions during smog tests but not when the vehicles are actually on the road.

"Using a defeat device in cars to evade clean air standards is illegal and a threat to public health," said Cynthia Giles, assistant EPA administrator, in a prepared statement. "Working closely with the California Air Resources Board, EPA is committed to making sure that all automakers play by the same rules."

The EPA sent Volkswagen a "notice of violation" and told car owners they can expect a recall notice. The agency said all repairs will be done at Volkswagen's expense. It added that the cars are safe to drive. The EPA has the authority to order automotive recalls.

Stanley Young, a spokesman for the ARB, said the federal and state agencies were first notified of the problem by independent researchers at West Virginia University and the International Council on Clean Transportation. Months of followup testing, including tests at an ARB lab in El Monte, confirmed the analyses.

Volkswagen officials in early September "admitted to CARB and EPA staff that these vehicles were designed and manufactured with a defeat device," according to an enforcement letter the California agency sent Friday to Volkswagen officials.

Young said "our major goal is to ensure that these cars come into compliance, that they're the same in the real world as they are on the test bench." The automaker eventually could face fines or other enforcement actions, he said.

The agencies plan to "dig more deeply into the extent and implications of Volkswagen's efforts to cheat on clean air rules, and to take appropriate further action," said Richard Corey, executive

officer of ARB, in a prepared statement.

The EPA said the recall affects VW Jettas, Beetles, Golfs and Audi A3s made in the 2009 to 2015 model years. It also covers VW Passats made in the 2014 and 2015 model years. Only diesel cars are affected. Young said ARB believes there are as many as 50,000 affected vehicles on the road in California.

Under the federal Clean Air Act, California has the authority to set its own regulatory standards for car emissions.

Volkswagen of America spokesman Darryll Harrison Jr. said the company is cooperating with the federal and state agencies but had no further comment.

The Atlantic:

http://www.theatlantic.com/technology/archive/2015/09/volkswagens-game-of-make-belief/406159/

Volkswagen's Game of Make-Believe

The company inserted a device into almost 500,000 cars meant to trick emissions testing, the EPA says.

ROBINSON MEYER

One of the great lessons of the pioneering computer scientist Alan Turing is this: Computers are only pretending machines. Software is always just imitating something else.

Volkswagen seems to have taken this maxim to new heights. The Environmental Protection Agency alleges that the company installed "defeat devices" in its four-cylinder Volkswagen and Audi-brand diesel cars from 2009 to 2015.

These devices, essentially, let the cars pretend to not break the law. The software could sense when the car was undergoing emissions testing and activate its pollution-control systems accordingly. When the car was being driven during normal use, these systems largely did not activate—making the car a much heavier polluter in real-life than it looked on paper.

With those systems deactivated, the car's emissions violated the Clean Air Act and California's state pollution-control regulation.

"Using a defeat device in cars to evade clean-air standards is illegal and a threat to public health," said Cynthia Giles, assistant administrator for the EPA's Office of Enforcement and Compliance Assurance, in a statement.

There are almost 500,000 vehicles on American roads with the devices installed, according to the EPA. Volkswagen must now pay to repair the emissions systems in affected cars. The government may also fine the company as much as $18 billion.

The device was discovered by researchers at West Virginia University, who notified the EPA and California state authorities. The two authorities investigated further, and after demanding "an explanation for the identified emission problems, Volkswagen admitted that the cars contained defeat devices," said a statement from the agency.

I reached out to Volkswagen for comment and haven't heard back yet. The Times reports that the company is complying with investigations.

Volkswagen urged to recall cars for allegedly cheating emissions test

BY CHRIS PERKINS

Automakers are under intense pressure to meet emissions regulations put in place by the world's governments. Volkswagen allegedly had a slightly different solution.

The U.S. Environmental Protection Agency (EPA) ordered a recall of almost 500,000 Volkswagen and Audi vehicles equipped with four-cylinder diesel engines, for software designed to sidestep emissions regulations, reports the New York Times.

In total, 482,000 vehicles are being implicated, including the 2009-2015 Volkswagen Golf, Beetle, Jetta and Beetle, the 2014-2015 Volkswagen Passat and the 2009-2015 Audi A3. The cars were possibly installed with a "defeat device," a piece of software designed to detect when the car is undergoing emissions testing and turn on all of the car's emissions control systems then. In normal driving, the systems would turn off, causing 40 times larger nitrogen oxide emissions, according to the E.P.A.

Nitrogen oxide is a major contributor to smog, which can lead to increased respiratory problems and premature death.

The installation of this software is in violation of the Clean Air Act, and as such, the E.P.A, the State of California and the Department of Justice will launch an investigation. The installation of this software is in violation of the Clean Air Act, and as such, the E.P.A, the State of California and the Department of Justice will launch an investigation.

U.S. regulators hope that this recall will send a message to automakers to not develop software to skirt regulations. Last November, Hyundai and Kia were fined $100 million for violating the Clean Air Act. The two companies inflated their fuel economy figures for their 2012 vehicles.

The likely reason why Volkswagen could go the trouble to develop and use software like this is to boost performance; emissions control equipment tends to suck power out of an engine.

Researchers from West Virginia University, working with the International Council on Clean Transportation, discovered the software, according to the EPA's press release.

"Volkswagen Group of America, Inc., Volkswagen AG and Audi AG received today notice from the US Environmental Protection Agency, US Department of Justice and the California Air Resources Board of an investigation related to certain emissions compliance matters. VW is cooperating with the investigation; we are unable to comment further at this time," said a representative for Volkswagen.

A representative for the EPA wasn't immediately available for comment.

It's unclear if this issue only pertains to U.S. model Volkswagens and Audis equipped with four-cylinder diesels, or their world-market counterparts as well.

A report from Jalopnik notes that all of Volkswagen's ads for its diesel models have been deleted from YouTube, apparently at the company's request.

Why the EPA is forcing Volkswagen to recall nearly 500,000 cars

Volkswagen AG, the German car manufacturer, is under investigation by California and US emissions regulators for allegedly circumventing emission tests with a new device.

By Corey Fedde, Staff SEPTEMBER 18, 2015

Volkswagen AG is under investigation for circumventing clean air rules.

German automotive company Volkswagen AG is under investigation by California and US environmental regulators. The US Environmental Protection Agency told Reuters Volkswagen allegedly used software to circumvent emissions testing of specific air pollutants.

"Put simply, these cars contained software that turns off emissions controls when driving normally and turns them on when the car is undergoing an emissions test," Cynthia Giles, an EPA enforcement officer, told Reuters via teleconference.

The feature, known as a "defeat device," is allegedly present in 4 cylinder Volkswagen and Audi vehicles from 2009-2015, which total nearly 500,000 vehicles. The device is programmed to detect when the car is undergoing an emissions test and turn on the full emissions controls. The

device then turns the emission controls off during normal driving. The result being far more pollution than the company reported, the EPA told The New York Times.

The pollutant the "defeat device" is designed to conceal, nitrogen oxide, has been linked by public health officials to variety of health problems, including asthma.

The 500,000 diesel vehicle models affected include 2009-2015 Volkswagen Jettas, Beetles, Golfs, Passats, and Audi A3s.

The violation and investigation belie a growing trend in more aggressive environmental enforcement from federal regulators. In November 2014, the administration announced its largest ever penalty for a violation of the Clean Air Act on Korean automakers Hyundai Motor and Kia Motors. The fine involved a $300 million settlement for overstating vehicle fuel-economy standards on more than 1 million cars.

According to The New York Times, analysts say the crackdown is meant to send a clear message to automakers that circumventing federal rules will not be tolerated.

California, the EPA, and the Justice Department are working together on the investigation.

"Using a defeat device in cars to evade clean air standards is illegal and a threat to public health. Working closely with the California Air Resources Board, EPA is committed to making sure that all automakers play by the same rules. E.P.A. will continue to investigate these very serious violations," Ms. Giles told the Times.

This report includes material from Reuters.

Volkswagen could face $18 billion penalties from EPA

WASHINGTON | BY TIMOTHY GARDNER

Volkswagen AG (VOWG_p.DE) could face penalties up to $18 billion after being accused of designing software for diesel cars that deceives regulators measuring toxic emissions, the U.S. Environmental Protection Agency said on Friday.

"Put simply, these cars contained software that turns off emissions controls when driving normally and turns them on when the car is undergoing an emissions test," Cynthia Giles, an enforcement officer at the EPA, told reporters in a teleconference.

Volkswagen can face civil penalties of $37,500 for each vehicle not in compliance with federal clean air rules. There are 482,000 four-cylinder VW and Audi diesel cars sold since 2008 involved in the allegations. If each car involved is found to be in noncompliance, the penalty could be $18 billion, an EPA official confirmed on the teleconference.

A U.S. Volkswagen spokesman said the company "is cooperating with the investigation; we are unable to comment further at this time."

The feature in question, which the EPA called a "defeat device," masks the true emissions only during testing and therefore when the cars are on the road they emit as much as 40 times the level of pollutants allowed under clean air rules meant to ensure public health is protected, Giles said.

The EPA accused Volkswagen of using software in four-cylinder Volkswagen and Audi diesel cars from model years 2009 to 2015 made to circumvent emissions testing of certain air pollutants.

The cars are not facing recall at this time, the EPA said.

The diesel-powered vehicles involved from the 2009 to 2015 model years are the VW Jetta, VW Beetle, VW Golf and the Audi A3, as well as the VW Passat from model years 2014 and 2015.

Feds accuse VW of going around federal emissions standards

By Devin Henry - 09/18/15 12:50 PM EDT

The Environmental Protection Agency (EPA) is accusing Volkswagen of looking to circumvent federal air pollutant emission standards for the last six years.

EPA officials alleged Friday that about 482,000 VW vehicles sold since 2008 violate the Clean

Air Act due to software installed on the vehicles that turns off required air pollution protections.

Janet McCabe, an acting assistant administrator, said the EPA "intends to hold VW responsible to recall the vehicles" and fix the emissions problem. The company could face up to an $18 billion fine for the violations.

The EPA issued VW a Clean Air Act violation notice Friday, alleging it used a software algorithm on certain vehicles that would turn on emission controls only when they undergo official emissions testing.

This "defeat device," the EPA said, would switch off those controls during normal operation, which means the vehicles could emit up to 40 times the amount of nitrogen oxide allowed under federal air pollution standards.

"These violations are very serious … not only because they result in excess emissions, but also because VW was concealing the fact from EPA, the state of California and from consumers," Assistant Administrator Cynthia Giles said. "We expected better from VW."

Federal law requires manufacturers to certify to the EPA that their cars meet emissions standards before selling their vehicles in the U.S. Cars with defeat devices cannot be certified, the EPA said.

A VW statement said only that the company had received the violation notice and is cooperating with the investigation.

The EPA and the California Air Resources Board discovered the defeat device during an analysis at West Virginia State University, the EPA said. Officials said their investigation into the incident is ongoing and wouldn't give many more details about how it developed or what the outcome might be.

The agency is not ordering a recall or announcing penalties at the moment, and officials said the cars are safe and legal to drive. The Friday announcement, Giles said, was meant to "inform the public right away and to put VW on notice of our continuing investigation."

The EPA said the announcement covers VW Jettas, Beetles, Golfs and Audi A3s with model years between 2009 and 2015, as well as the VW Passat with model years 2014 and 2015.

Volkswagen ordered to recall almost a half-million cars over emissions trick

by Benjamin Snyder

The Environmental Protection Agency is ordering Volkswagen to recall nearly a half-million cars after the company allegedly used a computer software trick to make the cars seem more environmentally friendly during state emissions tests.

The VW models involved include the diesel versions of the following models: The 2009-15 Volkswagen Jetta, the 2009–15 Beetle, the 2009–15 Golf, the 2014-15 Passat and the 2009-15 Audi A3. The recall affects 482,000 vehicles in total.

"Using a defeat device in cars to evade clean air standards is illegal and a threat to public health," said Cynthia Giles, Assistant Administrator for the Office of Enforcement and Compliance Assurance, in a statement. "Working closely with the California Air Resources Board, EPA is committed to making sure that all automakers play by the same rules. EPA will continue to investigate these very serious matters."

"Volkswagen Group of America, Inc., Volkswagen AG and Audi AG received today notice from

the US Environmental Protection Agency, US Department of Justice and the California Air Resources Board of an investigation related to certain emissions compliance matters," Volkswagen says. "VW is cooperating with the investigation; we are unable to comment further at this time."

Volkswagen Used Illegal Software to Cheat Emissions Tests: EPA

By Stephen Elmer Sep 18, 2015

Volkswagen may be forced to recall almost 500,000 diesel passenger cars after an investigation revealed illegal software was allowing the vehicles to pass government emissions standards.

A software algorithm, known as a defeat device, used on roughly 482,000 Volkswagen vehicles with four-cylinder diesel engines is able to detect when the car is undergoing official emissions testing, and will activate full emissions controls only during the test.

The EPA says that this results in cars that meet emissions standards while being tested, but emit 40 percent more nitrogen oxides while driving.

Independent analysis at West Virginia University uncovered the defeat devices. After being questioned by the EPA and CARB, Volkswagen admitted that its cars did contain defeat devices.

The EPA says "it is incumbent" on Volkswagen to initiate a recall fix for all the affected cars, although they note that these vehicles are still safe to drive and do not present a safety hazard at this time.

Volkswagen may be liable for civil penalties over the findings, which could total up to $18 billion if the EPA leverages its maximum find of $37,500 per vehicles.

"Using a defeat device in cars to evade clean air standards is illegal and a threat to public health," said Cynthia Giles, Assistant Administrator for the Office of Enforcement and Compliance Assurance. "Working closely with the California Air Resources Board, EPA is committed to making sure that all automakers play by the same rules. EPA will continue to investigate these very serious matters."

Models affected by the issue include the 2009-2015 Volkswagen Jetta, Beetle and Gold. The 2009-2015 Audi A3 is also affected, along with the 2014-2015 Passat.

Volkswagen acknowledged that it has received notice of the investigation. "VW is cooperating with the investigation; we are unable to comment further at this time," said the brand.

EPA: Volkswagen used 'defeat device' to circumvent air pollution controls

By Joby Warrick September 18 at 1:04 PM

The Environmental Protection Agency on Friday accused Volkswagen of installing a software "defeat device" that circumvented pollution controls on nearly a half-million Volkswagens and Audis.

The regulatory agency filed a notice of violation against the German automaker, saying the company deliberately cheated on clean-air rules by installing the software of five of its models since 2008. An EPA statement warned of possible civil penalties and hinted of a future possible recall, saying it was "incumbent on Volkswagen to initiate the process" to fix the affected cars' emissions systems.

"Using a defeat device in cars to evade clean air standards is illegal and a threat to public health," said Cynthia Giles, the EPA's assistant administrator for EPA's Office of Enforcement and Compliance Assurance.

EPA officials, in a joint probe with California's regulatory agency, determined that Volkswagen had inserted a sophisticated algorithm in the cars' emissions software that could detect when a vehicle was undergoing emissions testing. The software, which the EPA called a "defeat device," would turn on full emissions controls during testing, and switch them off again under normal driving conditions.

As a result, the cars emitted far more pollution–up to 40 times the federal standard for the pollutant known as NOx, a component in urban smog, the EPA said.

The software was installed in Volkwagen's Golfs, Jettas and Beetles and Audi A3s beginning in the model year 2009, and in Volkswagen's Passat models beginning in 2014. EPA officials said no action was required by owners of the car, but they suggested that Volkswagen would be compelled to address the problem.

"Our goal now is to ensure that the affected cars are brought into compliance, said Richard Corey, the executive officer for California's Air Resources Board." He said federal and state agencies intended to "dig more deeply into the extent and implications of Volkswagen's efforts to cheat on clean air rules, and to take appropriate further action."

EPA Accuses Volkswagen of Dodging Emissions Rules

Agency says German auto maker circumvented air-pollution standards with software

By AMY HARDER

WASHINGTON—The U.S. Environmental Protection Agency issued a notice on Friday alleging that Volkswagen AG circumvented air-pollution standards with software installed on nearly a half million cars sold in the U.S. since 2008.

Officials said Volkswagen could face penalties of up to $37,500 per vehicle, or a total of more than $18 billion, though it remained unclear whether the government would eventually levy such a large penalty. Officials said the German auto maker violated the federal Clean Air Act.

The agency said that owners of these cars don't need to take any action right now and that while the cars have emissions exceeding federal standards, "these violations do not present a safety hazard and the cars remain legal to drive," according to the EPA.

Officials said a recall hasn't been announced and an investigation continues. They plan to at some point order Volkswagen to fix the vehicles, officials said.

Top EPA officials made the announcement alongside the California Air Resources Board, which is separately investigating the alleged use of the software, which EPA describes as a "defeat device." The software reduces the effectiveness of a car's emission control system during normal driving conditions and enables the car to emit nitrogen oxides at up to 40 times the allowable standard, according to the EPA.

"Using a defeat device in cars to evade clean air standards is illegal and a threat to public health," said Cynthia Giles, Assistant Administrator for the Office of Enforcement and Compliance at the EPA.

"Volkswagen Group of America Inc., Volkswagen AG and Audi AG received today notice from the U.S. Environmental Protection Agency, U.S. Department of Justice and the California Air Resources Board of an investigation related to certain emissions compliance matters," Volkswagen said in a statement. "VW is cooperating with the investigation; we are unable to comment further at this time."

EPA said that its allegations cover roughly 482,000 diesel passenger cars with model years between 2009 and 2015 and sold in the U.S. since 2008. They include the following models: the Jetta, Beetle, Audi A3, Golf and Passat.

The Clean Air Act requires vehicle manufacturers to certify to EPA that their products meet federal air-pollution standards. EPA said Friday that by making and selling vehicles with the "defeat device" software, Volkswagen was violating two parts of the Clean Air Act.

Volkswagen Used 'Defeat Device' To Skirt Emissions Rules, EPA Says

BILL CHAPPELL

Saying Volkswagen violated the Clean Air Act, the Environmental Protection Agency says the company's diesel-powered cars have sophisticated software that detects emissions testing – and "turns full emissions controls on only during the test."

Installed on four-cylinder cars, the software, which the EPA calls a "defeat device" that's meant to trick official tests, allowed diesel Jettas, Beetles, and other cars to "emit up to 40 times more pollution" than allowed under U.S. emission standards.

The agency says that after the carmaker was confronted with emission test results this month, it admitted that the cars contain defeat devices.

Volkswagen must now fix the cars' emissions control systems, the agency says, adding that Volkswagen could be liable for civil penalties and other punishment. The cars in question are popular Volkswagen and Audi models that were made from 2009 to this year.

The affected diesel cars include:

- Jetta (Model Years 2009 – 2015)
- Beetle (Model Years 2009 – 2015)
- Audi A3 (Model Years 2009 – 2015)

• Golf (Model Years 2009 – 2015)

• Passat (Model Years 2014-2015)

"Using a defeat device in cars to evade clean air standards is illegal and a threat to public health," said Cynthia Giles, assistant administrator for the Office of Enforcement and Compliance Assurance.

The Verge:

http://www.theverge.com/2015/9/18/9352757/epa-volkswagen-recall-emissions

Volkswagen ordered to recall 500,000 cars for gaming emissions testing

By Colin Lecher

The federal government has ordered Volkswagen to recall almost 500,000 vehicles, saying the company unlawfully used special software to get around missions regulations.

VOLKSWAGEN ALLEGEDLY USED A "DEFEAT DEVICE."

Volkswagen allegedly used a so-called "defeat device" on certain models made in the past six years. The device works by only turning on emissions control when undergoing emissions testing, but not when the car is actually being driven normally and pollution is at its peak. "This results in cars that meet emissions standards in the laboratory or testing station, but during normal operation, emit nitrogen oxides, or NOx, at up to 40 times the standard," the EPA said in a statement.

Using such a device is a violation of the Clean Air Act, which, as The New York Times points out, the EPA has been increasingly cracking down on. In November, the agency hit Hyundai and

Kia with a record $100 million fine for violations under the act.

The cars affected by the recall include the 2009 to 2015 Jetta, Beetle, Golf, and Audi A3. The 2014 and 2015 Passat is also included. According to the EPA, that adds up to 482,000 cars.

Jalopnik:

http://jalopnik.com/epa-orders-volkswagen-to-recall-482-000-diesel-cars-for-1731665972

EPA Orders Volkswagen To Recall 482,000 Diesel Cars For Cheating On Emissions

Patrick George

The New York Times reports Volkswagen has been ordered by the Environmental Protection Agency to recall 482,000 diesel cars in the U.S. over software they say was intentionally designed to circumvent smog regulations.

The cars, all diesels from 2009 to 2015, have a "defeat device" programmed to detect when the car is undergoing official emissions testing that only then turns on the full emissions control systems, the Times reports.

These controls are turned off in other situations, leading to far greater emissions than VW let on — which is against the law. The devices were designed to conceal nitrogen oxide emissions.

It's not immediately clear why VW had such a system on these cars, how the system detected official testing versus normal driving, or if the cars operated differently in normal driving when the defeat device was off. What effect did reducing NOx emissions have on fuel economy or performance?

"Using a defeat device in cars to evade clean air standards is illegal and a threat to public health," said Cynthia Giles, the E.P.A.'s assistant administrator for the Office of Enforcement and Compliance. "Working closely with the California Air Resources Board, E.P.A. is committed to making sure that all automakers play by the same rules. E.P.A. will continue to investigate these very serious violations."

The state of California and the Justice Department are also investigating the violation, the paper reports.

The vehicles affected are the 2009-2015 diesel Jetta, Beetle, Golf, Passat and Audi A3.

More on this as we get it.

EPA: Volkswagen used software to skirt emissions rules

By Greg Gardner

The U.S. Environmental Protection Agency and California are accusing Volkswagen of violating the Clean Air Act by using software that allows hundred of thousands of VW and Audi diesel-powered cars to get around emission standards.

"Using a defeat device in cars to evade clean air standards is illegal and a threat to public health," said Cynthia Giles, EPA assistant administrator for enforcement and compliance assurance. "Working closely with the California Air Resources Board, EPA is committed to making sure that all automakers play by the same rules. EPA will continue to investigate these very serious matters."

The agency's notice of violation covers about 482,000 diesel cars sold between 2009 and 2015 model years.

Affected diesel models include:

Jetta (model years 2009 – 2015)

Beetle (model years 2009 – 2015)

Audi A3 (model years 2009 – 2015)

Golf (model years 2009 – 2015)

Passat (model years 2014-2015)

California is separately issuing an In-Use Compliance letter to Volkswagen, and EPA and the California Air Resources Board (CARB) have both initiated investigations based on Volkswagen's alleged actions.

"Working with U.S. EPA we are taking this important step to protect public health thanks to the dogged investigations by our laboratory scientists and staff," said CARB executive officer Richard Corey. "Our goal is to ensure that the affected cars are brought into compliance, to dig more deeply into the extent and implications of Volkswagen's efforts to cheat on clean air rules, and to take appropriate further action."

The federal and California regulators say Volkswagen used a sophisticated software algorithm

on certain Volkswagen vehicles that detects when the car is undergoing official emissions testing and turns full emissions controls on only during the test. The effectiveness of these vehicles' pollution emissions control devices is greatly reduced during all normal driving situations.

As a result the cars met emissions standards in the laboratory or testing station, but during normal operation, emit nitrogen oxides, or NOx, at up to 40 times the permissible standard. The software produced by Volkswagen is a "defeat device," as defined by the Clean Air Act.

Corey said testing groups in Europe found information that indicated Volkswagen may have manipulated its emission tests and told California regulators about their suspicions.

NOx pollution contributes to nitrogen dioxide, ground-level ozone and fine particulate matter. Exposure to these pollutants has been linked with a range of serious health effects, including increased asthma attacks and other respiratory illnesses that can be serious enough to send people to the hospital. Exposure to ozone and particulate matter have also been associated with premature death due to respiratory-related or cardiovascular-related effects. Children, elderly people and those with pre-existing respiratory disease are particularly at risk for health effects of these pollutants.

The Clean Air Act requires vehicle manufacturers to certify to EPA that their products will meet applicable federal emission standards to control air pollution, and every vehicle sold in the U.S. must be covered by an EPA-issued certificate of conformity. Motor vehicles equipped with defeat devices, which reduce the effectiveness of the emission control system during normal driving conditions, cannot be certified. By making and selling vehicles with defeat devices that allowed for higher levels of air emissions than were certified to EPA, Volkswagen violated two important provisions of the Clean Air Act.

EPA and CARB uncovered the defeat device software after independent analysis by researchers at West Virginia University, working with the International Council on Clean Transportation, a non-governmental organization. The researchers raised questions about emissions levels, and the agencies began further investigations into the issue. In September, after EPA and CARB demanded an explanation for the emission problems, Volkswagen admitted that the cars contained defeat devices.

VW may be liable for civil penalties of up to $37,500 per vehicle found to be violating the standard, or potentially more than $18 billion.

It is incumbent upon Volkswagen to initiate the process that will fix the cars' emissions systems. Car owners should know that although these vehicles have emissions exceeding standards, these violations do not present a safety hazard and the cars remain legal to drive and resell. Owners of cars of these models and years do not need to take any action at this time.

EPA ACCUSES VOLKSWAGEN OF CHEATING EMISSIONS TESTING ON 482,000 CARS

Alex Davies

THE EPA IS accusing Volkswagen of illegally using software to cheat emissions standards, allowing the German automaker to sell half a million cars that produce smog at 40 times the legal limit.

In a notice of violation of the Clean Air Act sent to Volkswagen AG, Audi AG, and Volkswagen Group of America, Inc today, the EPA said diesel-powered VW cars used a "defeat device," a kind of "a sophisticated software algorithm [that] detects when the car is undergoing official emissions testing, and turns full emissions controls on only during the test. The effectiveness of these vehicles' pollution emissions control devices is greatly reduced during all normal driving situations."

The accusation applies to 482,000 diesel-powered, four-cyclinder Jetta, Beetle, Audi A3, Golf, and Passat cars sold between 2008 and 2015 in the US. The news comes as the Frankfurt motor show, one of the biggest events of the year for the automaker, opens to the press. VW will be

required to fix the problem, at no cost to car owners.

The Week:

EPA catches Volkswagen blatantly cheating on smog tests

Jeva Lange

Almost half a million Volkswagen cars, including recent diesel models of Jettas, Beetles, Audi A3s, Golfs, and Passats, may be recalled in an enormous crackdown on the German carmaker's alleged blatant circumvention of smog standards, The New York Times reports.

The Environmental Protection Agency has demanded that the cars be recalled, and specifically accused Volkswagen of installing software, called a "defeat device," in their cars that basically just lies about what a car's emissions are during tests:

The device is programmed to detect when the car is undergoing official emissions testing, and to only turn on full emissions control systems during that testing. Those controls are turned off during normal driving situations, when the vehicles pollute far more heavily than reported by the manufacturer, the E.P.A. said. [The New York Times]

Car emissions contain nitrogen oxide, which creates smog, as well as pollutants that cause asthma.

Volkswagen is accused of sidestepping emissions rules, 'cheating' pollution tests

By JERRY HIRSCH

Federal and California environmental regulators accused Volkswagen of using software that "cheats" pollution testing in nearly 500,000 recent model VWs and Audis by circumventing emission standards in its diesel cars.

The German automaker will eventually have to recall all of the vehicles and change the emissions systems at its own expense, regulators said. Additionally it could face a fine of about $18 billion, or $35,500 per car, federal environmental officials said.

The Environmental Protection Agency on Friday issued the German automaker a "notice of violation" of the Clean Air Act for both VW models and the company's Audi luxury brand. It covers models equipped with four-cylinder diesel engines. The California Air Resources Board issued a similar letter.

Volkswagen and Audi vehicles from model years 2009-2015 have the software, which uses an algorithm that detects when the vehicle is undergoing pollution tests and changes the way it performs from when it is being driven on the open road.

It "is illegal and a threat to public health," said Cynthia Giles, assistant administrator for the Office of Enforcement and Compliance Assurance. "EPA is committed to making sure that all automakers play by the same rules."

"We expected better from VW," Giles said.

Air Resources Board Executive Officer Richard Corey said the California agency wants to bring the cars "into compliance, to dig more deeply into the extent and implications of Volkswagen's efforts to cheat on clean air rules, and to take appropriate further action."

Volkswagen said it is cooperating with the investigation.

"We are unable to comment further at this time," the company said in a statement.

The affected diesel models include: Jetta (model years 2009 – 2015,) Beetle (model years 2009 – 2015,) Audi A3 (model years 2009 – 2015,) Golf (model years 2009 – 2015) and Passat (model years 2014-2015.)

Volkswagen And Audi Recall: 500,000 Cars Broke Environmental Rules, White House Says

By Christopher Harress

The Obama administration Friday forced car manufacturer Volkswagen to recall nearly 500,000 cars after it was discovered the German automaker had fitted its vehicles with special technology that can beat environmental tests for reducing smog, according to a new report.

The recall, which was imposed after an investigation by the Environmental Protection Agency, is expected to affect four-cylinder Volkswagen and Audi cars that were manufactured between 2009 and 2015.

"Using a defeat device in cars to evade clean air standards is illegal and a threat to public health," Cynthia Giles, the E.P.A.'s assistant administrator for the Office of Enforcement and Compliance, told the New York Times.

"Working closely with the California Air Resources Board, E.P.A. is committed to making sure that all automakers play by the same rules. E.P.A. will continue to investigate these very serious violations."

EPA: 482K VW diesel vehicles violated emissions rules

David Shepardson

Washington — The Environmental Protection Agency and the state of California said Volkswagen AG violated federal law by allowing 482,000 diesel VW and Audi cars sold since 2009 to evade emissions requirements using sophisticated software.

The announcement is a big setback to the German automaker that has made diesel vehicles a big part of its U.S. strategy. VW could face fines or criminal prosecution and must immediately prevent those vehicles from being able to defeat emissions rules.

VW concealed facts but has now admitted wrongdoing, said Cynthia Giles, assistant administrator for the Office of Enforcement and Compliance Assurance. "We expected better from VW," she said.

The agencies allege that four-cylinder Volkswagen and Audi diesel cars from model years 2009-2015 include software that circumvents EPA emissions standards for certain air pollutants. California is separately issuing an In-Use Compliance letter to Volkswagen, and EPA and the California Air Resources Board have initiated investigations based on Volkswagen's alleged actions.

EPA said the vehicles software "detects when the car is undergoing official emissions testing, and turns full emissions controls on only during the test." The vehicles include diesel Golf, Jetta, Sportwagen, Beetle and Audi A3 vehicles built from 2009-2015.

EPA said "the effectiveness of these vehicles' pollution emissions control devices is greatly reduced during all normal driving situations. This results in cars that meet emissions standards in the laboratory or testing station, but during normal operation, emit nitrogen oxides, or NOx, at up to 40 times the standard. The software produced by Volkswagen is a 'defeat device,' as defined by the Clean Air Act."

NOx pollution contributes to nitrogen dioxide, ground-level ozone, and fine particulate matter. EPA said exposure has been linked to serious health issues, including increased asthma attacks and other respiratory illnesses that can be serious enough to send people to the hospital. "Exposure to ozone and particulate matter have also been associated with premature death due to respiratory-related or cardiovascular-related effects. Children, the elderly, and people with pre-existing respiratory disease are particularly at risk for health effects of these pollutants," EPA said.

This is the latest example of automakers not following the miles per gallon and emissions rules.

"Using a defeat device in cars to evade clean air standards is illegal and a threat to public health," said Giles. "Working closely with the California Air Resources Board, EPA is committed to making sure that all automakers play by the same rules. EPA will continue to investigate these very serious matters."

The Clean Air Act requires vehicle manufacturers to certify to EPA that their products will meet applicable federal emission standards to control air pollution, and every vehicle sold in the U.S. must be covered by an EPA-issued certificate of conformity. Motor vehicles equipped with defeat devices, which reduce the effectiveness of the emission control system during normal driving conditions, cannot be certified.

"Working with U.S. EPA we are taking this important step to protect public health thanks to the dogged investigations by our laboratory scientists and staff," said Air Resources Board Executive Officer Richard Corey. "Our goal now is to ensure that the affected cars are brought into compliance, to dig more deeply into the extent and implications of Volkswagen's efforts to cheat on clean air rules, and to take appropriate further action."

The issue first came to the attention of the agencies in 2014 after independent analysis by researchers at West Virginia University, working with the International Council on Clean Transportation, a non-governmental organization, raised questions about emissions levels, and the agencies began further investigations into the issue.

In September, after EPA and CARB demanded an explanation for the identified emission problems, Volkswagen admitted that the cars contained defeat devices, the agencies said.

EPA said VW must recall the vehicles. EPA said "owners should know that although these vehicles have emissions exceeding standards, these violations do not present a safety hazard and the cars remain legal to drive and resell. Owners of cars of these models and years do not need to take any action at this time."

EPA Says VW Intentionally Violates Clean Air Standards

By MATTHEW DALY, ASSOCIATED PRESS WASHINGTON — Sep 18, 2015, 12:42 PM ET

The Environmental Protection Agency says nearly 500,000 Volkswagen and Audi diesel cars built in the past seven year are intentionally violating clean air standards by using software that evades EPA emissions standards.

The EPA says the cars include a device programmed to detect when the car is undergoing official emissions testing. The cars only turn on full emissions control systems during that testing. The EPA says the controls are turned off during normal driving situations.

The EPA called the company's use of the device illegal and a threat to public health.

The EPA called on VW to fix the cars' emissions systems, but said car owners do not need to take any immediate action.

VW said in a statement it is cooperating with the investigation.

Bloomberg:

http://www.bloomberg.com/news/articles/2015-09-18/epa-says-volkswagon-software-circumvented-car-emissions-testing

EPA Says Volkswagen Circumvented Car Emissions Tests

Jeff Plungis

Volkswagen AG sold diesel cars with software that circumvented U.S. emissions standards for air pollution, the Environmental Protection Agency said.

The company sold Volkswagen and Audi brand cars from model years 2009-2015 that contained a "sophisticated software algorithm" that detects when the car is undergoing official emissions testing, and turns on full emissions control, the agency said. During normal driving times, the systems don't operate fully, regulators said.

The potential fine is $37,500 per vehicle and 482,000 autos are part of the case, yielding a potential fine of more than $18 billion, Cynthia Giles, EPA assistant administrator for enforcement and compliance, said on a phone call with reporters Friday.

California is also investigating the claims.

Volkswagen said in a statement it is cooperating with the investigation and unable to comment further.

Business Insider:

http://www.businessinsider.com/vw-told-to-recall-500000-cars-after-us-government-accuses-it-of-dodging-clean-air-standards-2015-9

VW told to recall 500,000 cars after US government accuses it of dodging clean air standards

Benjamin Zhang

The Environmental Protection Agency has ordered the recall of 500,000 Volkswagen cars.

According to Coral Davenport of the New York Times, the EPA accused VW of using hidden software — called a "defeat device" — to dodge clean air standard during emissions testing.

“Using a defeat device in cars to evade clean air standards is illegal and a threat to public health,” assistant administrator for the Office of Enforcement and Compliance Assurance said Cynthia Giles said in a statement.

“Working closely with the California Air Resources Board, EPA is committed to making sure that all automakers play by the same rules. EPA will continue to investigate these very serious matters.”

In response to the recall, Volkswagen issued the following statement to Business Insider.

"Volkswagen Group of America, Inc., Volkswagen AG and Audi AG received today notice from the US Environmental Protection Agency, US Department of Justice and the California Air Resources Board of an investigation related to certain emissions compliance matters. VW is cooperating with the investigation; we are unable to comment further at this time."

The recall affects 482,000 diesel powered cars sold in the US since 2008. They include:

Volkswagen Jetta TDI: 2009-20015

Volkswagen Beetle TDI: 2009-2015

Audi A3 TDI: 2009-2015

Volkswagen Golf TDI: 2009-2015

Volkswagen Passat TDI: 2014-2015

This story is developing. We will update when more information is available.

EPA says Audi, VW cheating on emissions

By JOHN SICILIANO

The Environmental Protection Agency and California regulators charged automakers Volkswagen and Audi on Friday with purposefully violating emission standards in their line of diesel cars.

EPA accused the automakers of using a device in their vehicles to get around the pollution rules. According to EPA, the device regulates emissions, but only turns on and works while emissions are being tested.

"Using a defeat device in cars to evade clean air standards is illegal and a threat to public health," said Cynthia Giles, EPA assistant administrator for the agency's enforcement office. "Working closely with the California Air Resources Board, EPA is committed to making sure that all automakers play by the same rules. EPA will continue to investigate these very serious matters."

Giles said VW was "concealing facts" about the devices. The vehicle models involved include the popular Jetta, Audi A-3, Passat and the iconic Beetle, and in model years 2009-2015. The violations cover 482,000 diesel passenger cars.

The EPA's announcement isn't a final decision, but is a clear sign that the EPA believes it has a case against the automakers, one that could lead to fines as large as $37,000 per vehicle. All together, the combined fines could pile up to $18 billion.

An EPA statement said "California is separately issuing an In-Use Compliance letter to Volkswagen, and EPA and the California Air Resources Board ... have both initiated investigations based on Volkswagen's alleged actions."

"Working with US EPA we are taking this important step to protect public health thanks to the dogged investigations by our laboratory scientists and staff," the California board's CEO Richard Corey said. "Our goal now is to ensure that the affected cars are brought into compliance, to dig more deeply into the extent and implications of Volkswagen's efforts to cheat on clean air rules, and to take appropriate further action."

EPA accuses VW of cheating on emission rules

Published 12:29 PM EDT Sep 18, 2015

NEW YORK (CNNMoney) —Diesel cars from Volkswagen and Audi cheated on clean air rules by including software that made the cars look cleaner than they actually were, according to federal and California regulators.

The regulators say that the software on the cars turned up the emission controls only when it could tell that the car was being tested.

"The effectiveness of these vehicles' pollution emissions control devices is greatly reduced during all normal driving situations," said the Environmental Protection Agency's notice to the company. "This results in cars that meet emissions standards in the laboratory or testing station, but during normal operation, emit nitrogen oxides at up to 40 times the standard."

There are nearly 500,000 of the diesel cars on U.S. roads. The models include the VW Jetta, the Beetle and the Golf from model years 2009 through 2015, the Passat from 2014-2015 as well as the Audi A3, model years 2009-2015. The luxury brand is owned by Volkswagen.

Owners of the affected cars do not face health risks according to the EPA and can to continue to drive or sell the cars. But the EPA says that VW will be responsible for fixing the problem.

Volkwagen did not immediately respond to a request for comment.

City AM:

http://www.cityam.com/224676/volkswagen-told-recall-500000-vehicles-over-emissions

Volkswagen told to recall 500,000 vehicles over emissions

by Catherine Neilan

Volkswagen has been ordered to recall nearly half a million cars in the US by the Obama administration, which claims the German car group used software that was purposely designed to dodge environmental standards for reducing smog.

The US government's Environmental Protection Agency issued the company a notice of violation this afternoon, accusing Volkswagen of having installing a "defeat device" into its four-cylinder Volkswagen and Audi vehicles between 2009 and 2015, according to the New York Times.

The device is programmed to detect when the car is undergoing emissions test, during which time it will turn on its full emissions control systems. These controls are reportedly then turned off when the car is driving in "normal" situations, when the cars pollute more heavily than reported by Volkswagen, the EPA claims.

The government agency estimates that 482,000 diesel passenger vehicles are affected.

Volkswagen could not be contacted at the time of publication.

EPA: Volkswagen used 'sophisticated software' to cheat emissions tests

By Ben Wolfgang - The Washington Times - Friday, September 18, 2015

The Obama administration on Friday accused Volkswagen of using a "sophisticated software algorithm" to cheat on emissions testing and mask the fact that some models emit too much harmful pollution.

Some Volkswagen cars from model years 2009 to 2015, the Environmental Protection Agency said, include software that can detect when they're undergoing emissions testing. Full emissions controls were activated only during testing and then automatically shut down during normal operation, the agency charged.

"Using a defeat device in cars to evade clean air standards is illegal and a threat to public health," said Cynthia Giles, assistant administrator for the EPA's Office of Enforcement and Compliance Assurance. "Working closely with the California Air Resources Board, EPA is committed to making sure that all automakers play by the same rules. EPA will continue to investigate these very serious matters."

During normal operation, the "defeat device" allowed Volkswagen cars to emit nitrogen oxides at up to 40 times the federal threshold as laid out in the Clean Air Act.

The EPA has issued "a notice of violation" to the automaker, and the state of California has launched its own investigation into the matter. Volkswagen could face civil penalties for the violations, the agency said.

The allegations apply to about 482,000 diesel passenger cars sold since 2008, including Jettas, Beetles, Audi A3s, Golfs and other models.

EPA accuses Volkswagen, Audi of evading emission laws

Nathan Bomey, USA TODAY 12:12 p.m. EDT September 18, 2015

The German automaker adopted a "defeat device" to trick regulators, the EPA said.

The Environmental Protection Agency on Friday accused Volkswagen of installing software on certain cars in the U.S. to evade federal emission regulations, potentially exposing people to harmful pollutants.

The German automaker adopted what the EPA called a "defeat device" to trick U.S. regulators into believing that its cars met Clean Air Act standards, the federal agency said in a statement.

The agency said 482,000 cars violated federal standards, including four-cylinder Volkswagen cars from 2009-15 and Audi diesel cars from the same period. They included the Volkswagen Jetta, Beetle, Golf and Passat, and the Audi A3.

Volkswagen, whose brands include the luxury Audi lineup, may face fines or other penalties, the EPA said.

The cars are still safe to drive, the EPA said, and owners do not need to take immediate action. But the agency will require Volkswagen to fix the cars for free.

Newsweek:

http://www.newsweek.com/epa-volkswagen-software-cheat-clean-air-rules-373869

EPA: Volkswagen Used Software in Cars to Cheat on Clean Air Rules

BY ZOË SCHLANGER 9/18/15 AT 12:14 PM

A U.S. Environmental Protection Agency investigation has concluded that for years Volkswagen has been installing software in its vehicles that circumvents federal emissions standards for air pollution, the agency announced Friday.

EPA alleges that Volkswagen installed a "sophisticated software algorithm on certain Volkswagen vehicles" that could detect when the car was being tested for emissions. The software would turn full emissions controls on only during the official test. "This results in cars that meet emissions standards in the laboratory or testing station, but during normal operation, emit nitrogen oxides, or NOx, at up to 40 times the standard," EPA said in a press release. They called the software a "defeat device," deliberately installed to evade the Clean Air Act standards.

This "defeat device" was found in several car models, from 2009 models up to 2015 models, according to EPA:

Jetta (Model Years 2009 – 2015)

Beetle (Model Years 2009 – 2015)

Audi A3 (Model Years 2009 – 2015)

Golf (Model Years 2009 – 2015)

Passat (Model Years 2014-2015)

In total, this includes about 482,000 passenger cars.

"Using a defeat device in cars to evade clean air standards is illegal and a threat to public health," Cynthia Giles, EPA's Assistant Administrator for the Office of Enforcement and Compliance Assurance, said in a statement emailed Friday. The agency worked with California regulators to investigate the automobile manufacturer and issue a notice of violation.

"Our goal now is to ensure that the affected cars are brought into compliance, to dig more deeply into the extent and implications of Volkswagen's efforts to cheat on clean air rules, and to take appropriate further action," California Air Resources Board Executive Officer Richard Corey said in the statement.

Volkswagen has yet to respond publicly to the EPA allegations. Newsweek has reached out to the company for comment, and we will update if they respond.

Volkswagen Is Ordered to Recall Nearly 500,000 Vehicles Over Emissions Software

By CORAL DAVENPORT SEPT. 18, 2015

WASHINGTON — The Obama administration on Friday ordered Volkswagen to recall nearly a half million cars from the road, saying the German automaker used software intentionally designed to circumvent environmental standards for reducing smog.

The Environmental Protection Agency issued the company a notice of violation and accused the company of breaking the law by installing software known as a "defeat device" in 4-cylinder Volkswagen and Audi vehicles from model years 2009-15. The device is programmed to detect when the car is undergoing official emissions testing, and to only turn on full emissions control systems during that testing. Those controls are turned off during normal driving situations, when the vehicles pollute far more heavily than reported by the manufacturer, the E.P.A. said.

"Using a defeat device in cars to evade clean air standards is illegal and a threat to public health," said Cynthia Giles, the E.P.A.'s assistant administrator for the Office of Enforcement and Compliance. "Working closely with the California Air Resources Board, E.P.A. is committed to making sure that all automakers play by the same rules. E.P.A. will continue to investigate these very serious violations."

The software was designed to conceal the cars' emissions of the pollutant nitrogen oxide, which contributes to the creation of ozone and smog. The pollutants are linked to a range of health problems, including asthma attacks and other respiratory diseases.

The state of California has issued a separate notice of violation to the company. California, the E.P.A. and the Justice Department are working together on an investigation of the allegations.

The allegations cover roughly 482,000 diesel passenger cars sold in the United States since 2009.

Affected diesel models include the Volkswagen Jetta (model years 2009-15), Volkswagen Beetle (model years 2009–15), Audi A3 (model years 2009–15), Volkswagen Golf (model years 2009–15) and Volkswagen Passat (model years 2014-15).

The notice of violation is part of a broader, more aggressive enforcement effort by federal environmental regulators on the auto industry. Analysts said it was meant to send a clear message to automakers that they will be harshly treated for compromising federal rules.

It follows a November 2014 announcement of the administration's largest-ever penalty for a violation of the Clean Air Act, in which the government fined the Korean automakers Hyundai Motor and Kia Motors a combined $300 million as part of a settlement for overstating vehicle fuel-economy standards on 1.2 million cars.

"They want to make it clear that they're going to crack down on cheaters," said Frank O'Donnell, president of the environmental advocacy group Clean Air Watch. "They're cheating not only car buyers but the breathing public. They want to lay down the law, enforce the law, and show they're not going to tolerate cheaters. The laws and regulation are only as good as the enforcement."

The software was designed to conceal the cars' emissions of the pollutant nitrogen oxide, which contributes to the creation of ozone and smog. The pollutants are linked to a range of health problems, including asthma attacks and other respiratory diseases.

The state of California has issued a separate notice of violation to the company. California, the E.P.A. and the Justice Department are working together on an investigation of the allegations.

The allegations cover roughly 482,000 diesel passenger cars sold in the United States since 2009.

Affected diesel models include the Volkswagen Jetta (model years 2009-15), Volkswagen Beetle (model years 2009–15), Audi A3 (model years 2009–15), Volkswagen Golf (model years 2009–15) and Volkswagen Passat (model years 2014-15).

The notice of violation is part of a broader, more aggressive enforcement effort by federal

environmental regulators on the auto industry. Analysts said it was meant to send a clear message to automakers that they will be harshly treated for compromising federal rules.

It follows a November 2014 announcement of the administration's largest-ever penalty for a violation of the Clean Air Act, in which the government fined the Korean automakers Hyundai Motor and Kia Motors a combined $300 million as part of a settlement for overstating vehicle fuel-economy standards on 1.2 million cars.

"They want to make it clear that they're going to crack down on cheaters," said Frank O'Donnell, president of the environmental advocacy group Clean Air Watch. "They're cheating not only car buyers but the breathing public. They want to lay down the law, enforce the law, and show they're not going to tolerate cheaters. The laws and regulation are only as good as the enforcement."

Feds, Gulf states to jointly administer $8B restoration fund from BP settlement

By Kevin Rogers

The federal government and five Gulf of Mexico states will jointly administer a 15-year, $8 billion program to restore the gulf in connection with the settlement, announced Monday, of their lawsuits against BP for its 2010 Deepwater Horizon oil spill.

More than five years after the explosion that killed 11 workers and spilled 134 million gallons of crude into the gulf, the federal government on Monday unveiled its final

settlement with the company, worth $20.8 billion. Concurrently, BP settled with the five Gulf states directly affected by the spill, agreeing to pay them $4.9 billion, as well as up to $1 billion to local governments. The states involved are Florida, Texas, Mississippi, Louisiana and Alabama.

The settlement, subject to final court approval and a public comment period, includes $5.5 billion in Clean Water Act penalties, $8.1 billion in damages for the harm done to the Gulf's natural resources, up to $700 million for undetected natural resources damage, and $600 million to cover any additional uncompensated federal expenses. It is the largest single-entity settlement the Justice Department has ever pursued.

While the federal and state settlements are separate, approval of the federal settlement is conditioned on approval of the state agreement, the Justice Department said.

"Taken as a whole, this resolution is a strong and fitting response," Attorney General Loretta Lynch said at a news conference. "BP is receiving the punishment it deserves, while also providing critical compensation for the injuries it caused to the environment and the economy of the Gulf region."

In a statement, BP spokesman Geoff Morrell welcomed the agreement.

"The government has announced a number that includes amounts previously spent or disclosed by BP," he said. "As BP said in July, this settlement resolves the largest litigation liabilities remaining from the tragic accident, providing BP certainty with respect to its financial obligations and allowing us to focus on safely delivering the energy the world needs."

Environmental Protection Agency Administrator Gina McCarthy, speaking at the news conference with Lynch, said the penalties would be spent on recovery efforts.

"Justice is not about dumping a pile of money and walking away," she said. "It's about investing in sustainable ways that empower and strengthen the Gulf communities over the long term."

In that connection, the federal government unveiled a draft plan outlining how the settlement money — $8.1 billion in natural resources damages and the $700 million to cover unidentified costs — will be used over the next 15 years. The plan, to be administered by federal agencies and the five states, will focus on restoring habitats destroyed by the spill; improving water quality; repairing coastal damage; improving recreational opportunity access; and working to improve environmental monitoring and management.

The plan's proposed governance creates eight trustee implementation groups, each focused on a specific restoration effort.

- Five, consisting of federal and state officials, are focused on state-specific restoration projects. Louisiana would receive $5 billion, Alabama would receive $206 million,

Florida would receive $680 million, Mississippi would receive $295 million, and Texas would receive $238 million.

- One, consisting of federal officials, is focused on ocean-wide restoration efforts and would oversee $1.29 billion.
- One, consisting of representatives from the five states and the federal government, will focus on $349.8 million in region-wide projects.
- One, consisting of representatives from the five states and the federal government, will administer the $700 million contingency fund for handling hidden natural resource impacts.

"The Trustees will continue to work with people along the coast to ensure they have every opportunity to be engaged in these meaningful recovery and restoration efforts that will generate jobs, improve water quality, support our tribal responsibilities and result in an improved wildlife habitat for migratory birds and hundreds of vulnerable species," Interior Secretary Sally Jewell said in a statement.

The plan is subject to court approval, as well as a 60-day public comment period. Environmental groups voiced cautious optimism with the draft plan, but said they would closely monitor it to make sure the funding was well spent.

Bethany Carl Kraft, director of the Ocean Conservancy's Gulf Restoration Program, in a statement said the group's reaction to the settlement and the restoration plan was "largely positive." However, she highlighted some potential issues, including the governance model, which she said could prove unwieldy and "appears to decrease funding" for ocean-specific projects.

"Given the extent of known impacts in the Gulf waters, it is imperative that every restoration dollar available is allocated to projects that actually restore impacted resources," she said.

United States, 11 Pacific Rim countries reach trade deal

By Paul Wisemand and Christopher S. Rugaber

WASHINGTON (AP) — The United States and 11 other Pacific Rim countries have agreed to an ambitious and contentious trade pact that cuts trade barriers, sets labor and environmental standards and protects multinational corporations' intellectual property.

The agreement on the Trans-Pacific Partnership was reached Monday after marathon negotiating sessions in Atlanta through the weekend.

The road ahead may be even tougher: The agreement must get through a skeptical U.S. Congress.

The TPP is designed to encourage trade between the United States, Australia, Brunei, Canada, Chile, Japan, Malaysia, Mexico, New Zealand, Peru, Singapore and Vietnam. Together, the countries account for 40 percent of world economic output.

US, Chile declare new marine reserves, fight overfishing

By Bradley Klapper

VALPARAISO, Chile (AP) — President Barack Obama declared new marine sanctuaries in Lake Michigan and the tidal waters of Maryland on Monday, while Chile blocked off more than 200,000 square miles of the Pacific Ocean near the world-famous Easter Island from commercial fishing and oil and gas exploration.

The announcements came as top officials, including U.S. Secretary of State John Kerry, attended an international conference on marine protection in the Chilean port city of Valparaiso. Several nations also outlined plans for tracing seafood imports to combat overfishing and stemming increased pollution in the ocean.

The new protected waters in the United States are the first to be designated as such in 15 years, the White House said in a statement.

The 875-square mile area of Wisconsin's Lake Michigan extends from Port Washington to Two Rivers, containing a collection of 39 known shipwrecks. Fifteen are listed on the National Register of Historic Places.

The Mallows Bay-Potomac River in Maryland encompasses a 14-square mile area of the tidal Potomac River next to Charles County. Nearly 200 vessels, some dating to the Revolutionary War, are found in the largely undeveloped area that provides habitat for endangered species of wildlife and fish.

Court orders EPA to revise ship ballast dumping regulations

By John Flesher

TRAVERSE CITY, Mich. (AP) — A federal appeals court has ordered the government to rewrite regulations of ballast water discharges from ships, one of the leading culprits in the spread of invasive species across U.S. waterways.

The ruling Monday by the 2nd U.S. Circuit Court of Appeals came in a lawsuit filed by environmental groups against the U.S. Environmental Protection Agency.

The groups say an EPA permit issued in 2013 isn't strong enough to prevent vessels from introducing more harmful organisms such as zebra mussels, which have caused heavy damage in the Great Lakes and spread as far as the West Coast.

The court says the EPA erred in numerous ways, including by adopting international limits on live organisms in ballast water when technology was available to require tougher standards.

Boehner: House to vote for speaker Oct. 29, other jobs after

By Erica Werner

WASHINGTON (AP) — Speaker John Boehner on Monday scheduled the House election to replace him for Oct. 29 and delayed votes for lower-level posts until after that — a move widely seen as benefiting his preferred successor, Majority Leader Kevin McCarthy.

House Republicans, reeling and divided in the aftermath of Boehner's resignation last month, had planned to vote Thursday by secret ballot for a new leadership team. But a number of members wanted more time to weigh their options and pursue rule changes.

Under the new plan, Thursday's vote by Republican members will only involve their nominee for speaker. That will be followed by a floor vote in the full House on Oct. 29.

It will then be up to the new speaker to set an elections date for lower-level GOP posts from majority leader on down. The speaker is the only job in the House that's voted on by members of both parties in open session; the other jobs are selected internally by the party caucuses.

VW tells lawmakers 8M cars in Europe hit by emissions probe

By David Rising and Frank Jordans

BERLIN (AP) — Volkswagen says 8 million cars in the European Union are affected by an investigation into whether the automaker manipulated emissions tests, according to a letter received Monday by German lawmakers.

Volkswagen has previously said that 11 million diesel vehicles worldwide had engines fitted with software that can help them cheat U.S. emissions tests.

"Rest assured that at the moment we are working hard and coordinating closely with the authorities and the (German) federal government on a technical solution for the vehicles concerned," Volkswagen told lawmakers in the letter, which was obtained by The Associated Press.

"In the European Union eight million type EA 189 EU5 diesel engines with a 1.2 liter, 1.6 liter and 2.0 liter engine capacity are affected," said the letter, which was signed by VW lobbyists Thomas Steg and Michael Jansen.

UN releases a draft for potential agreement on climate

By Sylvie Corbet

PARIS (AP) — The United Nations on Monday released a first draft of the negotiating text for the major conference on climate taking place in Paris in December.

The document is a step forward for the talks, slimming down the text from more than 90 pages earlier this year to just 20.

Negotiators from 195 countries are to gather for a new session of talks Oct. 19-23 in Bonn, Germany.

A large number of proposals in the text are in parentheses, meaning they are still to be negotiated. The document notably includes a long-term goal for reduction in global greenhouse gas emissions, but details and deadline remain to be discussed.

Rare ferrets to find new home on former toxic site in Denver

By Dan Elliott

DENVER (AP) — Rare black-footed ferrets will be released Monday at the Rocky Mountain Arsenal National Wildlife Refuge — a milestone for the highly endangered animals and for the former toxic waste site on the industrial edge of Denver.

The U.S. Fish and Wildlife Service plans to turn 30 ferrets loose on the 25-square-mile refuge where chemical weapons and pesticides were once manufactured.

It became a wildlife refuge in 2010 after a $2.1 billion cleanup.

Black-footed ferrets were once thought to be extinct, but a small colony was discovered in 1981 in Wyoming. Researchers have been trying to restore the population since then.

Trian becomes one of top GE investors, buying $2.5B stake

By The Associated Press

NEW YORK (AP) — Trian Fund Management is now one of General Electric's biggest shareholders after the firm led by activist investor Nelson Peltz placed its largest bet to date, about $2.5 billion, as it positions itself to play a role in the transformation of the industrial conglomerate.

General Electric Co. has refocused its trajectory on its industrial roots — making large, complicated equipment for other companies — and selling off its financial operations. That, in a large part, is due to stricter federal oversight by federal regulators in the wake of the financial crisis.

That push continued Monday with the $2.5 billion sale of GE's corporate aircraft financing unit to Global Jet Capital. The private company based in Boca Raton, Florida, will get a portfolio of loans and leases, more than 300 aircraft and a team of GE employees.

Trian acquired 98.5 million shares, or about 1 percent of the Fairfield, Connecticut, company. The fund's executives, Peltz and Ed Garden, have a longstanding relationship with GE CEO Jeff Immelt. Rather than seeking to force corporate changes from GE, it appeared the Trian investment was in support of Immelt's goals.

Feds, Gulf states to jointly administer $8B restoration fund from BP settlement

By Kevin Rogers

The federal government and five Gulf of Mexico states will jointly administer a 15-year, $8 billion program to restore the gulf in connection with the settlement, announced Monday, of their lawsuits against BP for its 2010 Deepwater Horizon oil spill.

More than five years after the explosion that killed 11 workers and spilled 134 million gallons of crude into the gulf, the federal government on Monday unveiled its final

settlement with the company, worth $20.8 billion. Concurrently, BP settled with the five Gulf states directly affected by the spill, agreeing to pay them $4.9 billion, as well as up to $1 billion to local governments. The states involved are Florida, Texas, Mississippi, Louisiana and Alabama.

The settlement, subject to final court approval and a public comment period, includes $5.5 billion in Clean Water Act penalties, $8.1 billion in damages for the harm done to the Gulf's natural resources, up to $700 million for undetected natural resources damage, and $600 million to cover any additional uncompensated federal expenses. It is the largest single-entity settlement the Justice Department has ever pursued.

While the federal and state settlements are separate, approval of the federal settlement is conditioned on approval of the state agreement, the Justice Department said.

"Taken as a whole, this resolution is a strong and fitting response," Attorney General Loretta Lynch said at a news conference. "BP is receiving the punishment it deserves, while also providing critical compensation for the injuries it caused to the environment and the economy of the Gulf region."

In a statement, BP spokesman Geoff Morrell welcomed the agreement.

"The government has announced a number that includes amounts previously spent or disclosed by BP," he said. "As BP said in July, this settlement resolves the largest litigation liabilities remaining from the tragic accident, providing BP certainty with respect to its financial obligations and allowing us to focus on safely delivering the energy the world needs."

Environmental Protection Agency Administrator Gina McCarthy, speaking at the news conference with Lynch, said the penalties would be spent on recovery efforts.

"Justice is not about dumping a pile of money and walking away," she said. "It's about investing in sustainable ways that empower and strengthen the Gulf communities over the long term."

In that connection, the federal government unveiled a draft plan outlining how the settlement money — $8.1 billion in natural resources damages and the $700 million to cover unidentified costs — will be used over the next 15 years. The plan, to be administered by federal agencies and the five states, will focus on restoring habitats destroyed by the spill; improving water quality; repairing coastal damage; improving recreational opportunity access; and working to improve environmental monitoring and management.

The plan's proposed governance creates eight trustee implementation groups, each focused on a specific restoration effort.

- Five, consisting of federal and state officials, are focused on state-specific restoration projects. Louisiana would receive $5 billion, Alabama would receive $206 million,

Florida would receive $680 million, Mississippi would receive $295 million, and Texas would receive $238 million.

- One, consisting of federal officials, is focused on ocean-wide restoration efforts and would oversee $1.29 billion.
- One, consisting of representatives from the five states and the federal government, will focus on $349.8 million in region-wide projects.
- One, consisting of representatives from the five states and the federal government, will administer the $700 million contingency fund for handling hidden natural resource impacts.

"The Trustees will continue to work with people along the coast to ensure they have every opportunity to be engaged in these meaningful recovery and restoration efforts that will generate jobs, improve water quality, support our tribal responsibilities and result in an improved wildlife habitat for migratory birds and hundreds of vulnerable species," Interior Secretary Sally Jewell said in a statement.

The plan is subject to court approval, as well as a 60-day public comment period. Environmental groups voiced cautious optimism with the draft plan, but said they would closely monitor it to make sure the funding was well spent.

Bethany Carl Kraft, director of the Ocean Conservancy's Gulf Restoration Program, in a statement said the group's reaction to the settlement and the restoration plan was "largely positive." However, she highlighted some potential issues, including the governance model, which she said could prove unwieldy and "appears to decrease funding" for ocean-specific projects.

"Given the extent of known impacts in the Gulf waters, it is imperative that every restoration dollar available is allocated to projects that actually restore impacted resources," she said.

YONKERS, N.Y. (AP) — A fire official says a runaway oil tanker truck has crashed into the side of an apartment building, tipped on its side and spilled 100 gallons of oil in suburban New York.

Yonkers Fire Department Deputy Chief Kevin Ford says nobody was injured in the mishap Monday.

Ford says the truck's brakes gave way while it was stopped to make a delivery. The driver wasn't in it at the time.

Ford says the 4,000-gallon tanker descended a hill, hit a car and struck the building. He says the vehicle then tilted onto its side.

Polish government indicates commitment to coal over nuclear

By The Associated Press

Sponsored Links

WARSAW, Poland (AP) — Poland's prime minister says she does not consider nuclear energy a priority and is instead focused on strengthening the coal mining industry.

Ewa Kopacz's comments indicated a U-turn from earlier government plans to add nuclear energy to Poland's mix in the coming years.

Kopacz said Monday that Poland's energy security is based on coal. The country has rich deposits of the fossil fuel and the government is currently taking steps to preserve coal mines and thousands of jobs in the industry.

A few years ago, the government, then led by Donald Tusk, said a nuclear plant would be built and be operational around 2020.

Subject: October 8 VW hearing update

Hi all,

Here is the latest, and hopefully last update:

Panel 1 will convene at 10am Thursday and the Committee will move forward with both panels on Thursday. They will likely need to recess the hearing around noon for floor action and reconvene at approximately 2:30pm to finish EPA panel questioning.

Assuming this works for Chris and Phil's schedules, this may work out well. Please let me know any concerns.

Thanks,

Carolyn

Patrick Rucker

Reuters News Energy Reporter

Desk: 202 354 5858

Cell: 202 415 4075

There's an interesting diesel trains wrinkle in the 'defeat device' issue

In short, some of the conditions that seem to pushed Volkswagen to 'defeat' emissions tests are at play with trains

And it would be helpful to have an informal chat with someone there about train emissions and compliance to see if there might be something here

The emissions rules just got though for trains

NOx emissions must come down by 75 pct; hydrocarbon levels by 80 percent

That's a huge jump and train manufacturers are struggling to match that

Caterpillar – one of the two leading locomotive manufactures – could not meet those standards

They've been pushed out of the diesel locomotive sector and left the field to General Electric

Caterpillar now says they can have a 'conforming' engine on the market next year – a move that's surprised some in the industry

Judging by this org chat, I can imagine a few people here at Transportation and Air Quality might be able to help

But if you could help me with that informal chat, grateful

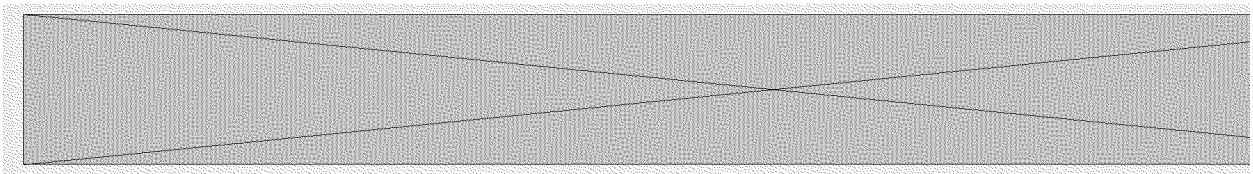
Subject: Overnight Energy & Environment: Feds finalize BP settlement



A RECORD SETTLEMENT: Federal officials finalized an over $20 billion deal with BP on Monday to settle lawsuits stemming from the company's 2010 oil spill.

Attorney General Loretta Lynch and a host of cabinet secretaries shared the settlement on Monday, more than three months after announcing the deal this summer.

"This resolution is strong and fitting," Lynch said. "BP is receiving the punishment it deserves while also providing critical compensation to the damage to the Gulf region."

Under the settlement, BP will spend $5.5 million to settle Clean Water Act claims, $7.1 million for environmental restoration work, and $5.9 million to state and local governments affected by the spill.

Officials also announced a Gulf of Mexico restoration fund, which will put BP money to work on coastal and habitat repair, water quality improvement in wetlands and recreational projects.

The settlement was less than the maximum fine BP could have owed. But Lynch said the final deal was an appropriate response.

"This is still the largest environmental penalty under the Clean Water Act and Oil Pollution Act, ever," she said.

Read more here.

ON TAP TUESDAY I: Energy Secretary Ernest Moniz will testify before the Senate Energy and Natural Resources Committee on the Strategic Petroleum Reserve.

ON TAP TUESDAY II: The North American Gas Forum will wrap up Tuesday with a schedule that includes a keynote address by Tony Clark, a commissioner on the Federal Energy Regulatory Commission. Reps. Ted Poe (R-Texas) and Bill Johnson (R-Ohio) will also speak, as will Sen. Heidi Heitkamp (D-N.D.).

Rest of Tuesday's agenda ...

The Energy Information Administration's Howard Gruenspecht will present the agency's winter fuels outlook Tuesday at the National Press Club.

AROUND THE WEB:

The Organization of Petroleum Exporting Countries is considering turning to Twitter to improve its international image, The Wall Street Journal reports.

Citigroup Inc. is pledging various steps to reduce its financing of coal mining, Bloomberg Business reports.

Federal officials in Canada are concerned about Montreal's plans to dump 8 billion liters of sewage into the St. Lawrence River, CBC News reports.

Subject: Morning Consult Energy: Regulators Ready to Approve $7 Billion U.S. Gas Export Terminal After TPP Deal; BP to Pay $20 Billion in Fines for Gulf of Mexico Oil Spill

By Deirdra O'Regan

Today's Washington Brief

- Federal regulators are prepared to sign off on the country's first natural gas export terminal after Pacific Rim nations agreed to a landmark trade deal Monday that would increase U.S. gas exports to Asia. The $7 billion facility in Oregon is expected to receive final approval in December. (Washington Examiner)

- The Obama administration reiterated its plans to issue regulations for oil and natural gas drilling in the Arctic Ocean. Regulators are moving forward with the rules, despite Royal Dutch Shell's decision to abandon drilling efforts in the region "for the foreseeable future." (The Hill)

- The lobbying effort to repeal the 40-year-old U.S. crude oil export ban has gathered considerable support, a testament to the industry's influence in Washington. Two Senate committees have already endorsed the legislation and a House vote may occur later this week. (The New York Times)

Today's Business Brief

- The U.S. said BP will pay more than $20 billion in fines to resolve claims from the 2010 Gulf of Mexico oil spill. The agreement adds to the $43.8 billion BP previously set aside for penalties and cleanup costs, constituting the largest corporate settlement of its kind in U.S. history. (Reuters)

- Citigroup became the third major bank this year to slash its lending to coal-mining companies. Coal companies must now gain "senior approval" for credit and pass more rigorous ethics guidelines, the latest blow to an industry which has seen borrowing costs soar this year. (The Huffington Post)

- Nuclear power plants around the world are failing to protect themselves against cyber attacks, a new report warns. The report cites 50 digital security incidents globally, most which were not made public. (Financial Times)

General

Deal reached on Pacific Rim trade pact in boost for Obama economic agenda
David Nakamura, The Washington Post

President Obama hailed the completion Monday of a historic 12-nation Pacific Rim trade deal that he said "reflects America's values," as his administration turned quickly from the global negotiating table to selling the deal on Capitol Hill. Obama pledged that the Trans-Pacific Partnership, the largest free-trade accord in a generation, would open new markets abroad for U.S. goods and services.

West Virginia sues VW over emissions scandal
Devin Henry, The Hill

West Virginia has sued Volkswagen (VW) over allegations the car manufacturer skirted federal emissions requirements. In a lawsuit filed Monday, West Virginia Attorney General Patrick Morrisey alleged the company violated a state consumer protection law by advertising "clean diesel" vehicles, even as they were equipped with devices to deceive required emissions controls.

Governors of N.D., Wyo. push for more time to deal with Clean Power Plan
Elizabeth Harball et al., E&E

The governors of two coal-dependent Western states, Wyoming and North Dakota, believe they have a strong case to make to the Obama administration about the extra time they need to comply with U.S. EPA's new rule to slash CO2 emissions from power plants… Last week the two Western governors told E&E Publishing they felt blindsided when the federal agency announced in August that both states will have to meet much steeper greenhouse gas reduction targets than initially proposed.

U.S. Index Futures Signal S&P 500 to Halt 2015's Longest Rally

Alex Longley, Bloomberg News

The longest winning streak for U.S. stocks this year may come to an end, if index futures are any indication. Standard & Poor's 500 Index E-mini contracts expiring in December fell 0.3 percent to 1,968.5 at 7:26 a.m. in New York, paring an earlier drop of as much as 0.6 percent. Dow Jones Industrial Average contracts lost 37 points to 16,622.

Oil & Natural Gas

Oil Halts Advance After German Data Weighs on Recovery Outlook
Angelina Rascouet, Bloomberg News

Oil's gain halted near $46 a barrel as German factory orders unexpectedly fell in a sign that Europe's economy is vulnerable to weaker growth in China and other emerging markets. Futures fell as much as 1.2 percent in New York after rising 1.6 percent on Monday. Factory orders in Europe's biggest economy dropped 1.8 percent in August compared with an estimate for a 0.5 percent gain, according to the German Economy Ministry.

Obama doubles down on Arctic drilling regs
Timothy Cama, The Hill

The Obama administration still plans to issue regulations for oil and natural gas drilling in the Arctic Ocean despite Royal Dutch Shell's decision to abandon its drilling efforts "for the foreseeable future." Brian Salerno, director of the Interior Department's Bureau of Safety and Environmental Enforcement (BSEE), said regulators are moving forward with their rules, even though drilling is not likely to return to the Arctic for years, or even decades.

U.S. says BP to pay $20 billion in fines for 2010 oil spill
Susan Heavey et al., Reuters

BP Plc will pay more than $20 billion in fines to resolve nearly all claims from its deadly Gulf of Mexico oil spill five years ago, marking the largest corporate settlement of its kind in U.S. history, Attorney General Loretta Lynch said on Monday. The agreement, first outlined in July, adds to the $43.8 billion BP had previously set aside for criminal and civil penalties and cleanup costs.

Feds set to approve first natural gas export facility to Asia
John Siciliano, Washington Examiner

Federal utility regulators are poised to sign off on the nation's first natural gas export terminal in the West, as Pacific Rim nations agree to a landmark trade deal Monday that would increase U.S. gas exports to Asia. The $7 billion Jordan Cove terminal on

Coos Bay in Oregon is slated to receive final approval by the Federal Energy Regulatory Commission in December, after receiving a positive environmental review Friday.

Oil Industry Gaining in Push for Repeal of U.S. Ban on Petroleum Exports
Eric Lipton and Clifford Krauss, The New York Times

A dozen top executives from some of the nation's largest oil exploration companies flew to Washington late last winter on an urgent mission: push Congress and the White House to allow unlimited exports of American crude oil. Now, their long-shot lobbying effort to repeal the 40-year-old export ban has gathered considerable momentum.

Global Oil to Cut Spending by $130 Billion, OPEC Says
Benoît Faucon, The Wall Street Journal

Global oil investments are set to be slashed by a staggering $130 billion this year, crimping supplies and ultimately boosting prices, OPEC's chief said Tuesday, and added that he was open to discuss the current oil market turmoil with the U.S. The remarks come as many members of the Organization of the Petroleum Exporting Countries have been running deficits as they fight for market share against American tight oil instead of oil prices.

Russia Oil Giant Selling Assets
Andrew Kramer, The New York Times

With a powerful ally of President Vladimir V. Putin at the helm, Rosneft has for more than a decade grown rapaciously inside Russia and abroad, as a company coming to symbolize the wealth and might of Russia during the oil boom. But that changed this year. Rosneft, though still the world's largest publicly traded oil company when measured by production, has been unloading assets while struggling to pay down debt.

Utilities & Infrastructure

Energy storage grabs spotlight in Southeast utility tech plays
Kristi E. Swartz, E&E

Leaders of the Southeast's utilities are making bold statements about where they see their companies heading when it comes to advanced energy storage, a corner of the technology world that even die-hard enthusiasts say is nascent. Energy storage is fast becoming the next step in the continuing transformation of the electric utility sector.

Renewables

Global Renewable Energy Capacity To Increase By 700 GW Over Next 5 Years, IEA
Joshua S Hill, Clean Technica

With costs falling and emerging economies stepping into the game, the International Energy Agency is predicting renewable energy capacity additions to grow 700 GW over the next five years. This growth is set to be driven by well-publicized falling costs of renewable energy technologies, and the increasing role of emerging economies, which are turning to renewable energy for much-needed electricity generation expansion.

SunEdison to layoff workers following spending spree & stock slump
Katie Fehrenbache, Fortune

Following a series of big acquisitions and months of slumping shares, clean energy giant SunEdison plans to lay off part of its workforce. The company put out a release on Monday morning that said the company plans to: "Simplify its business structure by removing duplicative activities created as a result of recent M&A activities and business growth…"

California Leads a Quiet Revolution
Beth Gardiner, The New York Times

California is cruising toward its 2020 goal for increasing renewable energy and is setting far more ambitious targets for the future. Its large-scale solar arrays produced more energy in 2014 than those in all other states combined.

Companies Struggle to Make Carbon Capture Viable
Mark Scott, The New York Times

Since the mid-2000s, several demonstration projects, from the United States to Spain, have received hundreds of millions of combined government support — and additional private funding — to show that the technology can significantly reduce carbon emissions from the world's dirtiest power and industrial plants. So far, however, few projects have proved their worth.

Royal Dutch Shell CEO to Call for Effective System for Pricing Carbon
Sarah Kent, The Wall Street Journal

The chief executive of oil firm Royal Dutch Shell PLC will tell a gathering of industry executives Tuesday that the world must find economic ways to reduce its dependence on the most polluting fossil fuels, calling on governments to institute an effective system for pricing carbon. The boss of one of the world's biggest oil and gas companies is promoting a carbon-pricing plan that will encourage investment in renewables and favor cleaner-burning natural gas over more carbon-intensive coal.

Coal

Why Another Big Bank Is Jumping On The Anti-Coal Bandwagon
Alexander C. Kaufman and Ben Walsh, The Huffington Post

Citigroup on Monday became the third banking giant this year to slash its lending to coal-mining companies. The move, which follows similar pledges this year from Bank of America and Crédit Agricole, will make it more difficult for companies producing coal, a major source of pollution and contributor to climate change, to finance future projects.

Nuclear

Nuclear power plants in 'culture of denial' over hacking risk
Sam Jones, Financial Times

Nuclear power plants around the world are harbouring a "culture of denial" about the risks of cyber hacking, with many failing to protect themselves against digital attacks, a review of the industry has warned. A focus on safety and high physical security means that many nuclear facilities are blind to the risks of cyber attacks, according to the report by think-tank Chatham House, citing 50 incidents globally of which only a handful have been made public.

Kazakhstan becomes top uranium supplier to US nuclear reactors
Phil Allan, Energy Voice

Kazakhstan became the leading supplier of uranium for the 100 operating US nuclear power reactors in 2014, according to US Energy Information Administration. The former Soviet republic supplied 12 million pounds, or 23%, of the 53.3 million pounds of uranium purchased by owners and operators of American reactors – nearly double the 6.5 million pounds of Kazakh-origin uranium purchased in 2013.

Climate

What the historic South Carolina floods can — and can't — tell us about climate change
Chris Mooney, The Washington Post

In 2013, after some controversy, South Carolina's Department of Natural Resources released a report on risks the state could face due to climate change. One of those risks? "A predicted result of climate change is the increase in intense storm events causing greater water inputs in shorter periods of time, affecting flood frequency and

duration," the report noted.

Opinions, Editorials & Perspectives

The Case for Compromise
Joe Nocera, The New York Times

The Frank R. Lautenberg Chemical Safety for the 21st Century Act — is the result of (shudder!) compromise. Those compromises were originally hammered out by Lautenberg, a liberal Democratic senator, and David Vitter, a right-wing Republican senator allied with the chemical industry. The two men co-sponsored a bill in May 2013. Then Lautenberg died.

Environmentalists: The Trans-Pacific Trade Agreement Is A Disaster For Climate Change
Samantha Page, ThinkProgress

If adopted, the TPP will eliminate or reduce tariffs between Australia, Brunei Darussalam, Canada, Chile, Japan, Malaysia, Mexico, New Zealand, Peru, Singapore, the United States, and Vietnam. But while it specifically addresses some environmental concerns — such as trade of illegally harvested resources or wildlife trafficking — climate change activists saw Monday's announcement as the culmination of a long-watched train wreck.

A Big Boost for the Climate Summit
The Editorial Board, The New York Times

The major task before the negotiators who will gather in Paris on Nov. 30 will be to follow up on the pledges with a plan for steady progress over the next few decades, so the 3.6-degree target remains in sight — as well as an agreed-upon scheme for monitoring and reporting each country's performance. Transparency — a divisive issue at the last big climate summit meeting, in Copenhagen in 2009 — is critical.

We need an insurance policy for climate change
Michael Green, The Hill

On Sept. 25, Rhode Island Sen. Sheldon Whitehouse (D) detailed his plan for combating climate change in the United States: put a price on the main instigator, carbon dioxide. Whitehouse is the sponsor of legislation that would put a fee on greenhouse gas emissions nationwide.

Research Reports, Issue Briefs & Case Studies

Cyber Security at Civil Nuclear Facilities: Understanding the Risks

Caroline Baylon et al., The Royal Institute of International Affairs

The report finds that the trend to digitization, when combined with a lack of executive-level awareness of the risks involved, means that nuclear plant personnel may not realize the full extent of their cyber vulnerability and are thus inadequately prepared to deal with potential attacks.

Renewables to lead world power market growth to 2020
International Energy Agency

Renewable energy will represent the largest single source of electricity growth over the next five years, driven by falling costs and aggressive expansion in emerging economies, the IEA said Friday. Pointing to the great promise renewables hold for affordably mitigating climate change and enhancing energy security, the report warns governments to reduce policy uncertainties that are acting as brakes on greater deployment.

Friday
NRC Advisory Committee on Reactor Safeguards meeting @ 8:30 a.m.
Society of Environmental Journalists annual conference @ 9 a.m.
CATO talk on regressive regulation to boost U.S. economic growth @ 12 p.m.

General

Deal reached on Pacific Rim trade pact in boost for Obama economic agenda
David Nakamura, The Washington Post

President Obama hailed the completion Monday of a historic 12-nation Pacific Rim trade deal that he said "reflects America's values," as his administration turned quickly from the global negotiating table to selling the deal on Capitol Hill. Obama pledged that the Trans-Pacific Partnership, the largest free-trade accord in a generation, would open new markets abroad for U.S. goods and services.

West Virginia sues VW over emissions scandal
Devin Henry, The Hill

West Virginia has sued Volkswagen (VW) over allegations the car manufacturer skirted federal emissions requirements. In a lawsuit filed Monday, West Virginia Attorney General Patrick Morrisey alleged the company violated a state consumer protection law by advertising "clean diesel" vehicles, even as they were equipped with devices to deceive required emissions controls.

Governors of N.D., Wyo. push for more time to deal with Clean Power Plan
Elizabeth Harball et al., E&E

The governors of two coal-dependent Western states, Wyoming and North Dakota, believe they have a strong case to make to the Obama administration about the extra time they need to comply with U.S. EPA's new rule to slash CO2 emissions from power plants… Last week the two Western governors told E&E Publishing they felt blindsided when the federal agency announced in August that both states will have to meet much steeper greenhouse gas reduction targets than initially proposed.

U.S. Index Futures Signal S&P 500 to Halt 2015's Longest Rally

Alex Longley, Bloomberg News

The longest winning streak for U.S. stocks this year may come to an end, if index futures are any indication. Standard & Poor's 500 Index E-mini contracts expiring in December fell 0.3 percent to 1,968.5 at 7:26 a.m. in New York, paring an earlier drop of as much as 0.6 percent. Dow Jones Industrial Average contracts lost 37 points to 16,622.

Oil & Natural Gas

Oil Halts Advance After German Data Weighs on Recovery Outlook
Angelina Rascouet, Bloomberg News

Oil's gain halted near $46 a barrel as German factory orders unexpectedly fell in a sign that Europe's economy is vulnerable to weaker growth in China and other emerging markets. Futures fell as much as 1.2 percent in New York after rising 1.6 percent on Monday. Factory orders in Europe's biggest economy dropped 1.8 percent in August compared with an estimate for a 0.5 percent gain, according to the German Economy Ministry.

Obama doubles down on Arctic drilling regs
Timothy Cama, The Hill

The Obama administration still plans to issue regulations for oil and natural gas drilling in the Arctic Ocean despite Royal Dutch Shell's decision to abandon its drilling efforts "for the foreseeable future." Brian Salerno, director of the Interior Department's Bureau of Safety and Environmental Enforcement (BSEE), said regulators are moving forward with their rules, even though drilling is not likely to return to the Arctic for years, or even decades.

U.S. says BP to pay $20 billion in fines for 2010 oil spill
Susan Heavey et al., Reuters

BP Plc will pay more than $20 billion in fines to resolve nearly all claims from its deadly Gulf of Mexico oil spill five years ago, marking the largest corporate settlement of its kind in U.S. history, Attorney General Loretta Lynch said on Monday. The agreement, first outlined in July, adds to the $43.8 billion BP had previously set aside for criminal and civil penalties and cleanup costs.

Feds set to approve first natural gas export facility to Asia
John Siciliano, Washington Examiner

Federal utility regulators are poised to sign off on the nation's first natural gas export terminal in the West, as Pacific Rim nations agree to a landmark trade deal Monday that would increase U.S. gas exports to Asia. The $7 billion Jordan Cove terminal on

Coos Bay in Oregon is slated to receive final approval by the Federal Energy Regulatory Commission in December, after receiving a positive environmental review Friday.

Oil Industry Gaining in Push for Repeal of U.S. Ban on Petroleum Exports
Eric Lipton and Clifford Krauss, The New York Times

A dozen top executives from some of the nation's largest oil exploration companies flew to Washington late last winter on an urgent mission: push Congress and the White House to allow unlimited exports of American crude oil. Now, their long-shot lobbying effort to repeal the 40-year-old export ban has gathered considerable momentum.

Global Oil to Cut Spending by $130 Billion, OPEC Says
Benoît Faucon, The Wall Street Journal

Global oil investments are set to be slashed by a staggering $130 billion this year, crimping supplies and ultimately boosting prices, OPEC's chief said Tuesday, and added that he was open to discuss the current oil market turmoil with the U.S. The remarks come as many members of the Organization of the Petroleum Exporting Countries have been running deficits as they fight for market share against American tight oil instead of oil prices.

Russia Oil Giant Selling Assets
Andrew Kramer, The New York Times

With a powerful ally of President Vladimir V. Putin at the helm, Rosneft has for more than a decade grown rapaciously inside Russia and abroad, as a company coming to symbolize the wealth and might of Russia during the oil boom. But that changed this year. Rosneft, though still the world's largest publicly traded oil company when measured by production, has been unloading assets while struggling to pay down debt.

Utilities & Infrastructure

Energy storage grabs spotlight in Southeast utility tech plays
Kristi E. Swartz, E&E

Leaders of the Southeast's utilities are making bold statements about where they see their companies heading when it comes to advanced energy storage, a corner of the technology world that even die-hard enthusiasts say is nascent. Energy storage is fast becoming the next step in the continuing transformation of the electric utility sector.

Renewables

Global Renewable Energy Capacity To Increase By 700 GW Over Next 5 Years, IEA
Joshua S Hill, Clean Technica

With costs falling and emerging economies stepping into the game, the International Energy Agency is predicting renewable energy capacity additions to grow 700 GW over the next five years. This growth is set to be driven by well-publicized falling costs of renewable energy technologies, and the increasing role of emerging economies, which are turning to renewable energy for much-needed electricity generation expansion.

SunEdison to layoff workers following spending spree & stock slump
Katie Fehrenbache, Fortune

Following a series of big acquisitions and months of slumping shares, clean energy giant SunEdison plans to lay off part of its workforce. The company put out a release on Monday morning that said the company plans to: "Simplify its business structure by removing duplicative activities created as a result of recent M&A activities and business growth…"

California Leads a Quiet Revolution
Beth Gardiner, The New York Times

California is cruising toward its 2020 goal for increasing renewable energy and is setting far more ambitious targets for the future. Its large-scale solar arrays produced more energy in 2014 than those in all other states combined.

Companies Struggle to Make Carbon Capture Viable
Mark Scott, The New York Times

Since the mid-2000s, several demonstration projects, from the United States to Spain, have received hundreds of millions of combined government support — and additional private funding — to show that the technology can significantly reduce carbon emissions from the world's dirtiest power and industrial plants. So far, however, few projects have proved their worth.

Royal Dutch Shell CEO to Call for Effective System for Pricing Carbon
Sarah Kent, The Wall Street Journal

The chief executive of oil firm Royal Dutch Shell PLC will tell a gathering of industry executives Tuesday that the world must find economic ways to reduce its dependence on the most polluting fossil fuels, calling on governments to institute an effective system for pricing carbon. The boss of one of the world's biggest oil and gas companies is promoting a carbon-pricing plan that will encourage investment in renewables and favor cleaner-burning natural gas over more carbon-intensive coal.

Coal

Why Another Big Bank Is Jumping On The Anti-Coal Bandwagon
Alexander C. Kaufman and Ben Walsh, The Huffington Post

Citigroup on Monday became the third banking giant this year to slash its lending to coal-mining companies. The move, which follows similar pledges this year from Bank of America and Crédit Agricole, will make it more difficult for companies producing coal, a major source of pollution and contributor to climate change, to finance future projects.

Nuclear

Nuclear power plants in 'culture of denial' over hacking risk
Sam Jones, Financial Times

Nuclear power plants around the world are harbouring a "culture of denial" about the risks of cyber hacking, with many failing to protect themselves against digital attacks, a review of the industry has warned. A focus on safety and high physical security means that many nuclear facilities are blind to the risks of cyber attacks, according to the report by think-tank Chatham House, citing 50 incidents globally of which only a handful have been made public.

Kazakhstan becomes top uranium supplier to US nuclear reactors
Phil Allan, Energy Voice

Kazakhstan became the leading supplier of uranium for the 100 operating US nuclear power reactors in 2014, according to US Energy Information Administration. The former Soviet republic supplied 12 million pounds, or 23%, of the 53.3 million pounds of uranium purchased by owners and operators of American reactors – nearly double the 6.5 million pounds of Kazakh-origin uranium purchased in 2013.

Climate

What the historic South Carolina floods can — and can't — tell us about climate change
Chris Mooney, The Washington Post

In 2013, after some controversy, South Carolina's Department of Natural Resources released a report on risks the state could face due to climate change. One of those risks? "A predicted result of climate change is the increase in intense storm events causing greater water inputs in shorter periods of time, affecting flood frequency and

duration," the report noted.

Opinions, Editorials & Perspectives

The Case for Compromise
Joe Nocera, The New York Times

The Frank R. Lautenberg Chemical Safety for the 21st Century Act — is the result of (shudder!) compromise. Those compromises were originally hammered out by Lautenberg, a liberal Democratic senator, and David Vitter, a right-wing Republican senator allied with the chemical industry. The two men co-sponsored a bill in May 2013. Then Lautenberg died.

Environmentalists: The Trans-Pacific Trade Agreement Is A Disaster For Climate Change
Samantha Page, ThinkProgress

If adopted, the TPP will eliminate or reduce tariffs between Australia, Brunei Darussalam, Canada, Chile, Japan, Malaysia, Mexico, New Zealand, Peru, Singapore, the United States, and Vietnam. But while it specifically addresses some environmental concerns — such as trade of illegally harvested resources or wildlife trafficking — climate change activists saw Monday's announcement as the culmination of a long-watched train wreck.

A Big Boost for the Climate Summit
The Editorial Board, The New York Times

The major task before the negotiators who will gather in Paris on Nov. 30 will be to follow up on the pledges with a plan for steady progress over the next few decades, so the 3.6-degree target remains in sight — as well as an agreed-upon scheme for monitoring and reporting each country's performance. Transparency — a divisive issue at the last big climate summit meeting, in Copenhagen in 2009 — is critical.

We need an insurance policy for climate change
Michael Green, The Hill

On Sept. 25, Rhode Island Sen. Sheldon Whitehouse (D) detailed his plan for combating climate change in the United States: put a price on the main instigator, carbon dioxide. Whitehouse is the sponsor of legislation that would put a fee on greenhouse gas emissions nationwide.

Research Reports, Issue Briefs & Case Studies

Cyber Security at Civil Nuclear Facilities: Understanding the Risks

Caroline Baylon et al., The Royal Institute of International Affairs

The report finds that the trend to digitization, when combined with a lack of executive-level awareness of the risks involved, means that nuclear plant personnel may not realize the full extent of their cyber vulnerability and are thus inadequately prepared to deal with potential attacks.

Renewables to lead world power market growth to 2020
International Energy Agency

Renewable energy will represent the largest single source of electricity growth over the next five years, driven by falling costs and aggressive expansion in emerging economies, the IEA said Friday. Pointing to the great promise renewables hold for affordably mitigating climate change and enhancing energy security, the report warns governments to reduce policy uncertainties that are acting as brakes on greater deployment.

NEW from Integer Research - Expert Briefing: The VW Diesel Emissions Crisis

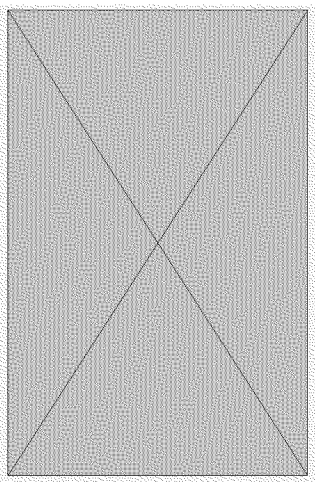
Dear Phillip,

Volkswagen's (VW) recent 'defeat device' admission is one of the biggest scandals to hit the global emissions control market. This shock development is causing a great deal of uncertainty for all industry players.

Our emissions team have reacted quickly to prepare a comprehensive Expert Briefing exploring the issues in greater detail, offering vital primary research data and covering key areas, including:

- The implications of the recall remedy for VW and its US customers
- Regulations and test cycles for emissions and fuel economy
- How the rest of VW's business is likely to be affected
- The structure of emissions and CO2/fuel economy regulation in Europe
- The likelihood of active use of defeat devices by VW and others in Europe
- Implications for emissions regulations and diesel technology in Europe

The report also includes original test data from Emissions Analytics, based on the most comprehensive EU and US real world PEMS emissions tests conducted by any independent group to date.



Price: $950

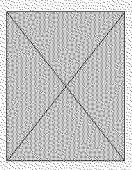
User-friendly Powerpoint format



Cut through the media noise - acquire independent market data and expert analysis

We have seen much reported so far, and no doubt there will be more to come. All of which reinforces the need across the industry for trusted (no irony intended) data on what is actually happening and more importantly what it all means.

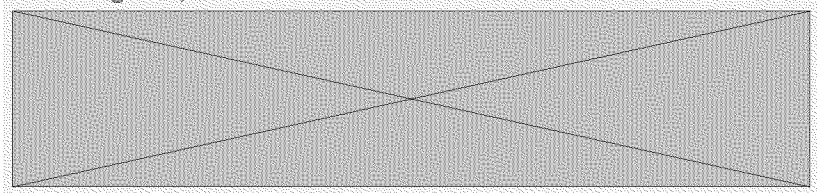
Why Integer?
Integer Research has spent over a decade analysing the diesel emissions sector. Our suite of leading conferences and range of high-quality publications and expert consulting services act as our credentials. Investing in our new Expert Briefing: The VW diesel emissions crisis >> will help answer your questions and provide vital clarity for your business.

You can order the briefing securely online today >> or alternatively, email us or call on +44 20 7503 1265.

I also look forward to seeing as many of you as possible at our forthcoming Integer Emissions Summit & DEF Forum USA 2015 >> in Chicago, 27-29 October, where we will also have a member of the VW emissions team presenting at the event.

If you have any questions regarding the impact of the VW story please don't hesitate to get in touch.

Kind regards,



Tim Cheyne
Director - Environment & Emissions

Cc: Snyder, Jim; Ex. 7
Subject: Correction and Relabel 2016 Golf R automatic

Hi Dave;

Following our discussion I am providing this summary. A new curb weight after production vehicles were weighed resulted in an increased ETW class for the 2016 2.0L Volkswagen Golf R with automatic transmission. Testing was performed and submitted to EPA for this new configuration at 3750 ETW and the EPA confirmatory testing was waived by Jim Snyder, and manufacturer's confirmatory testing was not needed. The original specific 5-cycle label results, to a tenth of a MPG, when compared to the new tests resulted in only a 0.4 MPG lower specific label city and highway label value. The rounded whole label values results in the same city and highway values, while the combined value dropped one MPG to 25 MPG from 26 MPG.

We agreed I would relabel this model with only the new data and the application for certification description for the Golf R automatic will be corrected. The curb weight of the manual 6-speed transmission configuration will also be corrected, however the ETW has not changed. I have relabeled this model in Verify (index #022) and the model type values on fuel economy labels will carry the new values going forward.

If you have any questions or concern please let me know.

Best regards,

U.S. HOUSE OF REPRESENTATIVES
COMMITTEE ON ENERGY AND COMMERCE

October 6, 2015

TO: Members, Subcommittee on Oversight and Investigations

FROM: Committee Majority Staff

RE: Hearing on "Volkswagen's Emissions Cheating Allegations: Initial Questions"

I. INTRODUCTION

On Thursday, October 8, 2015, at 10:00 a.m. in 2123 Rayburn House Office Building, the Subcommittee on Oversight and Investigations will hold a hearing entitled "Volkswagen's Emissions Cheating Allegations: Initial Questions." This hearing will examine the available facts and the initial compliance and consumer issues stemming from Volkswagen AG's reported use of engine software that would reduce the effectiveness of emissions control systems in certain make and model year diesel passenger vehicles in the United States, in apparent violation of the Clean Air Act and its implementing regulations.

II. WITNESSES

There will be two witness panels:

Panel 1:

- Michael Horn, President and Chief Executive Officer, Volkswagen Group of America

Panel 2:

- Christopher Grundler, Director, Office of Transportation and Air Quality, Office of Air and Radiation; and

- Phillip Brooks, Director , Air Enforcement Division, Office of Enforcement and Compliance Assurance, U.S. Environmental Protection Agency

III. SUMMARY

On September 18, 2015, the Environmental Protection Agency (EPA) issued a Notice of Violation (NOV) to Volkswagen AG, Audi AG, and Volkswagen Group of America (collectively, VW) based on a determination "that VW manufactured and installed defeat

devices" in certain model year Volkswagen and Audi diesel passenger cars.[1] The agency alleged that VW installed engine software that "sensed" when the vehicles were undergoing emissions testing and ensured emissions control systems were operating to pass the tests. During normal vehicle use, according to the agency, the software would "switch" to a different mode that produced emissions of nitrogen oxides (NOx) up to 10 to 40 times above current EPA standards. The California Air Resource Board (CARB), which investigated the matter with EPA, issued its own "In-Use Compliance Letter" to VW at the same time.[2]

The installation and use of a component — in this case engine software — to "bypass, defeat, or render inoperative elements of the vehicles' emission control system," would violate the Clean Air Act (CAA) and EPA regulations.[3] The alleged violations involve MY2009 to MY2015 VW and Audi vehicles equipped with 2.0 liter diesel engines, a vehicle population of approximately 480,000 in the United States.[4] Press reports in the wake of EPA's announcement suggest the violations could affect approximately 11 million vehicles worldwide.[5]

EPA and CARB have initiated enforcement investigations, which are ongoing. No fines or recalls to bring the vehicles into compliance have been announced to date. EPA also is expanding its review of other vehicles. The agency notified automakers on September 25, 2015, that it would add to its regimen of "confirmatory testing additional evaluations to look for additional defeat devices."[6] Multiple agencies and foreign governments also have launched their own investigations into VW's conduct.

VW has publically admitted and apologized for violating EPA's regulations and currently is conducting its own investigation and examining solutions to fix the software. The company also has announced significant changes to its leadership and corporate structure. On September 23, 2015, the company's CEO, Dr. Martin Winterkorn, resigned.[7] He was replaced by Matthias Muller, who most recently led the company's Porsche division. In addition, on September 25, 2015, the company has suspended the leaders of the VW, Audi, and Porsche research and development divisions and announced a restructuring of its North American business unit. The company has set aside more than $7 billion to address this alleged violation.

IV. BACKGROUND

A. Clean Air Act and EPA Regulations

The Clean Air Act and its implementing regulations are intended to protect human health and the environment by limiting pollution caused by emissions from various sources. Title II of the CAA grants EPA the authority to establish and regulate emissions standards for mobile sources, including automobiles. Among the pollutants regulated under Title II, significant attention is placed on NOx.[8] In combination with volatile organic compounds (VOCs), NOx contributes to the production of ground-level ozone.

Current emissions requirements for new motor vehicles, known as "Tier 2" standards, were promulgated in 2000 and phased in beginning in MY2004 vehicles, with full compliance required by MY2009.[9] The Tier 2 standards required manufacturers to reduce NOx emissions by 88% to 95%, depending on vehicle type, though compliance is based on fleet-wide emissions, rather than certification of each individual vehicle.[10] In 2014, new Tier 3 standards went into effect and will generally be phased in between MY2017 and MY2025.[11]

Compliance with EPA's motor vehicle emissions standards is governed by section 203 of the CAA. Prior to introducing a vehicle for sale in the United States, manufacturers must demonstrate that the vehicle meets emissions standards and obtain a certificate of conformity (COC) from the EPA. In the COC application submitted to the EPA, the manufacturer must list all auxiliary emission control devices (AECDs) installed on the vehicle.[12] An AECD is defined as "any element of design which senses temperature, vehicle speed, engine RPM, transmission gear, manifold vacuum, or any other parameter for the purpose of activating, modulating, delaying or deactivating the operation of any part of the emission control system."[13] The manufacturer must also justify each AECD and explain why it is not a "defeat device."[14] An AECD is considered a "defeat device" if it:

> . . . reduces the effectiveness of the emission control system under conditi ons which may reasonably be expected to be encountered in normal vehicle operation and use, unless: (1) Such conditions are substantially included in the Federal emission test procedure; (2) The need for the AECD is justified in terms of protecting the veh icle against damage or accident; (3) The AECD does not go beyond the requirements of engine starting; or (4) The AECD applies only to emergency vehicles . . . .[15]

It is a violation of the CAA to manufacture or sell any part or component if it will:

---

[8] The EPA estimates that on-road vehicles account for 38% of NOx emissions.

[13] 40 C.F.R. § 86.1803-01
[14] 40 C.F.R. § 86.1844-01(d)(11).
[15] 40 C.F.R. § 86.1803-01.

> . . . bypass, defeat, or render inoperative any device or element of design installed on or in a motor vehicle or motor vehicle engine in compliance with regulations under this subchapter, and where the person knows or should know that such part or component is being offered for sale or installed for such use or put to such use.[16]

It is also a violation to sell, market, or import any new motor vehicle if it is not covered by a valid EPA-issued COC.[17] Violations of these provisions are subject to civil penalties of up to $3,750 and $37,500, respectively, for any vehicle sold, marketed, or imported on or after January 13, 2009.[18]

EPA's Office of Transportation and Air Quality (OTAQ) oversees a broad set of compliance activities to ensure that vehicles manufacturers satisfy regulatory requirements. These include the review of COC applications and a variety of testing and other requirements that occur over the life a vehicle. In addition to review of manufacturer supplied testing data, EPA's own testing may include so-called "confirmatory testing," both random and targeted, and in use compliance testing. In addition, OTAQ conducts defect reporting programs and recall programs. According to available historical data, emissions recalls affect about three million vehicles annually.[19]

B. Timeline

Set forth below is a timeline of key events related to the VW emissions allegations. Note that the Committee's investigation is ongoing; the Committee will be receiving documents and collecting information in coming weeks that will illuminate the facts and circumstances of these events.[20] The information in this timeline is largely drawn from public sources and is presented to assist Committee Members during the hearing before the Subcommittee.

- May 2014: A study conducted by independent researchers at West Virginia University (WVU) on behalf of the International Council for Clean Transportation (ICCT) identified significantly higher on-road NOx emissions from two VW vehicles – a 2012 Jetta and a 2013 Passat.[21] The results of this study were brought to the attention of the EPA, CARB, and VW.

- May 2014 to December 2014: CARB and EPA launched investigations into the higher emissions in VW vehicles. VW initiated testing to replicate the ICCT/WVU research and

[16] CAA Section 203(a)(3)(B), 42 U.S.C. § 7522(a)(3)(B).
[17] CAA Section 203(a)(1), 42 U.S.C. § 7522(a)(1).

identify technical causes for the higher on-road emissions observed by the researchers.[22] VW asserted to EPA and CARB that "increased emissions from these vehicles could be attributed to various technical issues and unexpected in-use conditions."[23]

- December 2, 2014: VW shared testing results with EPA and CARB and proposed a "recalibration fix for the Gen1 (Lean NOx Trap technology) and Gen2 (Selective Catalytic Reduction (SCR) Technology) . . ."[24]

- December 2014: VW initiated a voluntary recall of approximately 500,000 vehicles in the United States. The recall included MY2009 to MY2014 diesel vehicles equipped with Gen1 and Gen2 technology.[25]

- May 6, 2015: CARB commenced testing to confirm that VW's recall solution addressed the higher on-road emissions.[26]

- May 6, 2015 to July 2015: CARB conducted laboratory and on-road testing to confirm the efficacy of the recall.[27] The testing showed limited improvement, prompting CARB to expand its investigation.[28]

- July 8, 2015: CARB shared test results with VW and the EPA, prompting a series of technical meetings. According to CARB, in the course of those meetings, "VW disclosed that Gen1, Gen2, and the 2015 model-year improved SCR vehicle (known as Gen3) had a second calibration intended to run only during confirmatory testing."[29]

- August 2015: EPA and CARB informed VW that they would not issue certificates of conformity for 2016 vehicles until VW could explain the higher emissions and provide assurance that they would not occur in 2016 vehicles.[30,31]

- September 3, 2015: VW admitted to EPA and CARB that it had designed and installed what was effectively a defeat device into these vehicles.

- September 18, 2015: EPA sent VW a Notice of Violation. CARB sent VW an in-use compliance letter.

- September 21, 2015: VW CEO, Dr. Martin Winterkorn, issued a public apology.

[31] EPA has not certified MY2016 vehicles and will not do so until it understands this issue.

- September 23, 2015: Dr. Winterkorn resigned from VW.

- September 25, 2015: EPA announced it is adding additional confirmatory testing of passenger vehicles intended as an effort to identify any additional defeat devices.

- September 25, 2015: VW suspended the leaders of the VW, Audi, and Porsche research and development divisions and announced a restructuring of its North American business unit.

V. Questions and Issues:

The following issues may be addressed at the hearing:

- What has been Volkswagen's response to the EPA allegations?
- What are the available facts concerning VW's violations?
- What is EPA's role in any measures to bring affected VW's into compliance?
- What can VW consumers expect going forward?

VI. Staff Contacts

If you have any questions regarding this hearing, please contact Peter Spencer or John Ohly of the majority Committee staff at (202) 225-2927.

U.S. HOUSE OF REPRESENTATIVES
COMMITTEE ON ENERGY AND COMMERCE

October 6, 2015

TO: Members, Subcommittee on Oversight and Investigations

FROM: Committee Majority Staff

RE: Hearing on "Volkswagen's Emissions Cheating Allegations: Initial Questions"

I. INTRODUCTION

On Thursday, October 8, 2015, at 10:00 a.m. in 2123 Rayburn House Office Building, the Subcommittee on Oversight and Investigations will hold a hearing entitled "Volkswagen's Emissions Cheating Allegations: Initial Questions." This hearing will examine the available facts and the initial compliance and consumer issues stemming from Volkswagen AG's reported use of engine software that would reduce the effectiveness of emissions control systems in certain make and model year diesel passenger vehicles in the United States, in apparent violation of the Clean Air Act and its implementing regulations.

II. WITNESSES

There will be two witness panels:

Panel 1:

- Michael Horn, President and Chief Executive Officer, Volkswagen Group of America

Panel 2:

- Christopher Grundler, Director, Office of Transportation and Air Quality, Office of Air and Radiation; and

- Phillip Brooks, Director , Air Enforcement Division, Office of Enforcement and Compliance Assurance, U.S. Environmental Protection Agency

III. SUMMARY

On September 18, 2015, the Environmental Protection Agency (EPA) issued a Notice of Violation (NOV) to Volkswagen AG, Audi AG, and Volkswagen Group of America (collectively, VW) based on a determination "that VW manufactured and installed defeat

devices" in certain model year Volkswagen and Audi diesel passenger cars.[1] The agency alleged that VW installed engine software that "sensed" when the vehicles were undergoing emissions testing and ensured emissions control systems were operating to pass the tests. During normal vehicle use, according to the agency, the software would "switch" to a different mode that produced emissions of nitrogen oxides (NOx) up to 10 to 40 times above current EPA standards. The California Air Resource Board (CARB), which investigated the matter with EPA, issued its own "In-Use Compliance Letter" to VW at the same time.[2]

The installation and use of a component — in this case engine software — to "bypass, defeat, or render inoperative elements of the vehicles' emission control system," would violate the Clean Air Act (CAA) and EPA regulations.[3] The alleged violations involve MY2009 to MY2015 VW and Audi vehicles equipped with 2.0 liter diesel engines, a vehicle population of approximately 480,000 in the United States.[4] Press reports in the wake of EPA's announcement suggest the violations could affect approximately 11 million vehicles worldwide.[5]

EPA and CARB have initiated enforcement investigations, which are ongoing. No fines or recalls to bring the vehicles into compliance have been announced to date. EPA also is expanding its review of other vehicles. The agency notified automakers on September 25, 2015, that it would add to its regimen of "confirmatory testing additional evaluations to look for additional defeat devices."[6] Multiple agencies and foreign governments also have launched their own investigations into VW's conduct.

VW has publically admitted and apologized for violating EPA's regulations and currently is conducting its own investigation and examining solutions to fix the software. The company also has announced significant changes to its leadership and corporate structure. On September 23, 2015, the company's CEO, Dr. Martin Winterkorn, resigned.[7] He was replaced by Matthias Muller, who most recently led the company's Porsche division. In addition, on September 25, 2015, the company has suspended the leaders of the VW, Audi, and Porsche research and development divisions and announced a restructuring of its North American business unit. The company has set aside more than $7 billion to address this alleged violation.

IV. BACKGROUND

A. Clean Air Act and EPA Regulations

The Clean Air Act and its implementing regulations are intended to protect human health and the environment by limiting pollution caused by emissions from various sources. Title II of the CAA grants EPA the authority to establish and regulate emissions standards for mobile sources, including automobiles. Among the pollutants regulated under Title II, significant attention is placed on NOx.[8] In combination with volatile organic compounds (VOCs), NOx contributes to the production of ground-level ozone.

Current emissions requirements for new motor vehicles, known as "Tier 2" standards, were promulgated in 2000 and phased in beginning in MY2004 vehicles, with full compliance required by MY2009.[9] The Tier 2 standards required manufacturers to reduce NOx emissions by 88% to 95%, depending on vehicle type, though compliance is based on fleet-wide emissions, rather than certification of each individual vehicle.[10] In 2014, new Tier 3 standards went into effect and will generally be phased in between MY2017 and MY2025.[11]

Compliance with EPA's motor vehicle emissions standards is governed by section 203 of the CAA. Prior to introducing a vehicle for sale in the United States, manufacturers must demonstrate that the vehicle meets emissions standards and obtain a certificate of conformity (COC) from the EPA. In the COC application submitted to the EPA, the manufacturer must list all auxiliary emission control devices (AECDs) installed on the vehicle.[12] An AECD is defined as "any element of design which senses temperature, vehicle speed, engine RPM, transmission gear, manifold vacuum, or any other parameter for the purpose of activating, modulating, delaying or deactivating the operation of any part of the emission control system."[13] The manufacturer must also justify each AECD and explain why it is not a "defeat device."[14] An AECD is considered a "defeat device" if it:

> . . . reduces the effectiveness of the emission control system under conditi ons which may reasonably be expected to be encountered in normal vehicle operation and use, unless: (1) Such conditions are substantially included in the Federal emission test procedure; (2) The need for the AECD is justified in terms of protecting the veh icle against damage or accident; (3) The AECD does not go beyond the requirements of engine starting; or (4) The AECD applies only to emergency vehicles . . . .[15]

It is a violation of the CAA to manufacture or sell any part or component if it will:

---

[8] The EPA estimates that on-road vehicles account for 38% of NOx emissions.

> . . . bypass, defeat, or render inoperative any device or element of design installed on or in a motor vehicle or motor vehicle engine in compliance with regulations under this subchapter, and where the person knows or should know that such part or component is being offered for sale or installed for such use or put to such use.[16]

It is also a violation to sell, market, or import any new motor vehicle if it is not covered by a valid EPA-issued COC.[17] Violations of these provisions are subject to civil penalties of up to $3,750 and $37,500, respectively, for any vehicle sold, marketed, or imported on or after January 13, 2009.[18]

EPA's Office of Transportation and Air Quality (OTAQ) oversees a broad set of compliance activities to ensure that vehicles manufacturers satisfy regulatory requirements. These include the review of COC applications and a variety of testing and other requirements that occur over the life a vehicle. In addition to review of manufacturer supplied testing data, EPA's own testing may include so-called "confirmatory testing," both random and targeted, and in use compliance testing. In addition, OTAQ conducts defect reporting programs and recall programs. According to available historical data, emissions recalls affect about three million vehicles annually.[19]

B. Timeline

Set forth below is a timeline of key events related to the VW emissions allegations. Note that the Committee's investigation is ongoing and the Committee will be receiving documents and collecting information in coming weeks that will illuminate the facts and circumstances of these events.[20] The information in this timeline is largely drawn from public sources and is presented to assist Committee Members during the hearing before the Subcommittee.

- May 2014: A study conducted by independent researchers at West Virginia University (WVU) on behalf of the International Council for Clean Transportation (ICCT) identified significantly higher on-road NOx emissions from two VW vehicles – a 2012 Jetta and a 2013 Passat.[21] The results of this study were brought to the attention of the EPA, CARB, and VW.

- May 2014 to December 2014: CARB and EPA launched investigations into the higher emissions in VW vehicles. VW initiated testing to replicate the ICCT/WVU research and

CAMPAIGN 2016:

Clintons court coal miners with talk of safety, benefits

Manuel Quiñones, E&E reporter

Published: Monday, October 5, 2015

Former President Bill Clinton and former Secretary of State Hillary Clinton, the front-runner for the Democratic presidential nomination, spent the weekend making comments apparently meant to woo coal miners.

A traditional Democratic constituency, coal miners and their backers have been turning to the Republican Party as the Obama administration has cracked down on coal-fired power plants and pollution from mining.

But Democrats have tried to get an edge by promoting worker benefits and safety. The Clintons took that tack.

Speaking Friday at the West Virginia Democratic Party's Jefferson-Jackson dinner fundraiser, former President Clinton stressed the importance of helping displaced miners from coal's downturn.

At least some of that displacement comes because of recent rules. The Obama White House has proposed a plan involving grants and other aid to help hard-hit Appalachian communities.

Clinton noted that coal mining has long been on the decline. "We know that at some pace or another there is a trend underway that probably cannot be reversed," he said, according to the *Charleston Gazette-Mail*. "Nobody has a right to claim anybody's life over it, to take the best years of their life away."

He continued, "We can't turn our back on mining communities. If we're going to go into the future, shouldn't we give preference to the places that have benefited us in the past?"

Clinton praised the likes of Sen. Joe Manchin (D-W.Va.) for introducing legislation to help miners obtain black lung disease benefits. Manchin was another top speaker at the fundraiser.

"That ought to pass. That bill should pass," said Clinton, recalling his own experience helping miners obtain black lung benefits as a young attorney.

Clinton also took issue with part of Patriot Coal Corp.'s proposed bankruptcy reorganization plan. "The last thing we should do is allow money set aside for coal miners in bankruptcy to be claimed by the lawyers," he said.

Former Secretary of State Clinton, great-granddaughter of a Welsh coal miner, has touched on similar themes during her campaign, including during remarks to Senate Democrats in July (*E&E Daily*, July 16).

But her support for the Obama administration's Clean Power Plan to cut greenhouse gas emissions from coal power plants has given pro-coal Democrats like Manchin pause (*E&E Daily*, Sept. 25).

Clinton complemented her husband's remarks in statements exclusive to the Reuters news service, where she also took aim at Patriot's bankruptcy plan. She said it was "outrageous and must be stopped."

She said, "Patriot Coal is trying to take $18 million of the $22 million put aside for retired coal miners, wives and widows and use it to pay its lawyers instead. Ensuring health care and retirement security should be the first priority in a bankruptcy proceeding, not the last."

Patriot has defended its bankruptcy plan, under review by U.S. Bankruptcy Court in Richmond, Va., including the sale of some assets to Blackhawk Mining LLC, as the best for miners, retirees and creditors.

The United Mine Workers of America has been in talks with Blackhawk Mining and the Virginia Conservation Legacy Fund, which also wants to buy Patriot assets, on worker agreements.

The union is also pressing lawmakers in Congress to help beef up retiree benefits, imperiled by the industry downturn. The UMWA benefits plan receives interest dollars from the abandoned coal mine reclamation fund.

UTILITIES:

D.C. mayor said to reach agreement on Exelon-Pepco merger

Published: Monday, October 5, 2015

Washington, D.C., Mayor Muriel Bowser (D) is circulating a draft agreement to allow Exelon Corp. to buy utility Pepco Holdings Inc., officials who have seen the proposal said.

If approved, the deal would provide more customer bill credits than first proposed and would require Exelon to set up a second corporate headquarters in the nation's capital.

Exelon has sought an agreement with Washington officials after its bid to purchase Pepco was rejected by the Public Service Commission of the District of Columbia in August. The commission said that the merger would harm consumers and run counter to the city's goal of increasing its use of clean energy.

The companies appealed the commission's decision last month. At the time, the utilities said the rejection "fails to recognize the substantial immediate and long-term benefits of our merger proposal to citizens, businesses and communities in the District of Columbia" (*Greenwire*, Sept. 1).

Bowser spokeswoman Olivia Dedner and spokesmen for Exelon and Pepco declined to comment (Mark Chediak, Bloomberg, Oct. 2). **-- SP**

DOE:

Marine vet, deputy IG named acting watchdog

Kevin Bogardus, E&E reporter

Published: Monday, October 5, 2015

Rickey Hass has been named acting inspector general for the Department of Energy.

Hass, a longtime member of the department's internal watchdog office, started in the position yesterday. He was first appointed deputy inspector general for audits and inspections in December 2010.

Hass has signed off on some of the most attention-grabbing reports from the IG office in recent times.

He was the signatory on IG audits that have exposed major department failings, such as finding missing uranium on a laundry truck at the Y-12 National Security Complex (*Greenwire*, Sept. 4). He also poked holes in DOE's management of its renewable energy funds (*Greenwire*, June 20, 2014).

Hass also signed off on a DOE inspector general report once hidden from the public and obtained by *Greenwire* under the Freedom of Information Act. That report detailed fights and death threats at the Office of Secure Transportation, which is responsible for transporting America's nuclear weapons (*Greenwire*, April 1).

As IG, Hass replaces Gregory Friedman.

Friedman said in July this year that he would step down as inspector general this month. He held the position for 17 years, beginning in 1998, after having first joined the federal government in 1968 as an auditor for the Defense Department (*Greenwire*, July 15).

Hass has over 20 years of experience performing federal audits, according to the IG's website. He has directed the department's consolidated financial statements audits as well as developing the office's technology audits, which investigate cybersecurity and information technology at DOE.

Hass also served for 22 years in the Marine Corps, earning several commendations such as the Meritorious Service, Navy Commendation and Navy Achievement medals. After he retired from active duty, he joined the DOE IG office in 1991.

For his work at the department, Hass also has been the recipient of the Presidential Rank Award and has been recognized by the Council of Inspectors General on Integrity and Efficiency several times.

He graduated magna cum laude from Chaminade University of Honolulu with a bachelor's degree in accounting and is a certified public accountant licensed in Maryland.

AIR POLLUTION:

EPA outlines steps for implementing ozone standard

Amanda Reilly, E&E reporter

Published: Monday, October 5, 2015

U.S. EPA's top air official expressed confidence that most areas of the country will be able to meet the new ozone standard and outlined agency plans in a memo to regional offices last week.

Acting EPA air chief Janet McCabe laid out a schedule for meeting the new limit of 70 parts per billion that gives states about five years to submit plans for lowering ozone levels.

She also sought to reassure states and local areas that EPA will be a willing partner in reducing ground-level ozone concentrations.

"I want to emphasize that we will work with our state, local, federal and tribal partners," McCabe wrote, "to carry out the duties of ozone air quality management in a manner that maximizes common sense, flexibility and cost-effectiveness."

EPA announced Thursday that it was lowering the national ambient air quality standard from 75 ppb -- the level set in 2008 during the George W. Bush administration -- to 70 ppb based on a review of public health data (*Greenwire*, Oct. 1).

In the memo, McCabe said EPA will release a guidance document early next year laying out the process of designating which areas of the country are not meeting the 70 ppb limit and must take actions to reduce their pollution levels.

Under the Clean Air Act, EPA is required to finalize a list of areas that are in "nonattainment" with the new standard by Oct. 1, 2017. The agency will likely rely on 2014-2016 data to develop that list, McCabe said.

According to EPA, 213 counties with air quality monitors, excluding California, will measure ozone concentrations higher than 70 ppb based on 2012-2014 data.

EPA will propose a rule to address implementation issues, as well as update existing air quality rules and permitting guidelines to reflect the new standard, McCabe wrote.

"We recognize that the owners and operators of emissions sources need clarity and certainty about regulatory requirements, especially when there are changes in air quality standards that may affect their construction and operations," she wrote.

States won't be expected to submit to EPA formal implementation plans laying out how they will achieve the new ozone standard until 2020 or 2021, the memo says.

"The goal," McCabe said, "is achieving clean air, while recognizing the many other activities underway and the resource constraints that we and our co-regulators face."

The agency says it expects all but 14 counties will achieve the standard by 2025 thanks to other air quality regulations that are already in place.

Green groups have dismissed the new standard as not providing enough protection against the negative health effects associated with ozone pollution (*Greenwire*, Oct. 2).

Business and industry have argued that it will impose steep compliance costs.

Bill Becker, executive director of the National Association of Clean Air Agencies, said EPA had "threaded the needle" with its choice of a 70 ppb standard. NACAA represents state and local air regulators nationwide.

"The agency has appropriately balanced the views of divergent stakeholders with the public's right to breathe clean air," Becker said. "By following the expert advice of its independent science advisers, EPA has set the stage for state and local air pollution control agencies to begin implementing this important program."

Most areas around the country, Becker said, are on a path toward compliance with the 70 ppb limit. Businesses will have nearly a decade to meet any new requirements stemming from the new standard, based on EPA's schedule, he noted.

In California, EPA said meeting the new ozone standard will prove difficult in some of the state's most polluted air basins that are surrounded by mountains, including the Los Angeles region. Under the Clean Air Act, however, those areas will have longer to come into attainment with the new limit.

The California Air Resources Board applauded the new limit in a statement last week.

"The new standard will mean a reduction in premature mortality, hospitalizations, emergency room visits for asthma, and lost work and school days," said board Chairwoman Mary Nichols. "This is especially critical in the South Coast and San Joaquin Valley, where nearly two-thirds of our state's residents live, including large numbers of people who work outside and who have asthma and other chronic heart and lung diseases."

The Air Resources Board said its strategy for cleaning up pollution from cars and trucks would help it achieve the 70 ppb standard. It urged EPA to adopt a new national standard for nitrogen oxide from heavy-duty trucks. NOx is a key ingredient of ground-level ozone.

"ARB will develop new heavy-duty diesel engine emissions standards within the next several years," the regulatory agency said, "while simultaneously petitioning U.S. EPA to establish a corresponding national standard."

Some states are warning that the new limit will be challenging to achieve due to the transport of ozone across state lines, as well as because of "background ozone" coming to the United States from overseas.

"Implementation of this new, lower standard will be difficult in Arizona," said Arizona Department of Environmental Quality Air Quality Division Director Eric Massey in a statement. "Emissions and options to reduce them are few, particularly in rural areas."

In a document released with the new standard, EPA said it will work "closely" with states to address high ozone concentrations in rural areas and due to background ozone.

The agency said it plans this fall to release proposed revisions to its exceptional events rule -- through which states can submit data to EPA to show that an air quality violation is beyond their control -- to make it easier to use in the face of a tighter ozone standard.

EPA is also planning to release a guidance for addressing high ozone levels due to wildfires.

AIR POLLUTION:

VW knowingly installed defeat devices -- aides

Published: Monday, October 5, 2015

Aides with knowledge of an internal inquiry being conducted by Volkswagen AG say the automaker started installing defeat devices in 2008 after it built a new engine at great expense, only to learn it could not meet air pollution standards in the United States and elsewhere.

Managers decided to cheat on the tests rather than throw out years of work on the engines, the aides said.

"We are working intensively to clarify what occurred," a Volkswagen spokesman said. "Thoroughness comes before speed. We will provide information as soon as we have facts" (Jack Ewing, *New York Times*, Oct. 4).

A new analysis by the Associated Press shows Volkswagen's efforts did not simply avoid costs to the company -- it could have killed between five and 20 people in the United States each year, because of the increased air emissions generated.

VW's emissions let the cars spew enough pollution to cause between 16 and 94 deaths over seven years, with the toll increasing as more of the vehicles hit U.S. roads. The company sells far more diesel cars in Europe, which likely saw greater health impacts from the excess emissions.

"Statistically, we can't point out who died because of this policy, but some people have died or likely died as a result of this," said Carnegie Mellon University environmental engineering professor Peter Adams, who helped calculate the figures (Seth Borenstein, AP/*U.S. News and World Report*, Oct. 5).

The finding that Volkswagen may have cheated on emissions tests is bringing new scrutiny to its only pollution testing center in the United States.

The test center in Oxnard, Calif., near the coast, was opened in 2012. At the time, VW bragged the air inside was cleaner than the strawberry fields nearby.

Now questions are mounting over whether staff at the California site were aware the automaker was cheating on the emissions tests or whether the deception occurred without their knowledge. At the site, VW tested its vehicles to determine if they met pollution standards.

"That would be one of the top facilities on my list to get inside of, whether through a subpoena or a search warrant," said William Carter, a former federal prosecutor in Los Angeles. "You'd want to explore what's there" (Flaccus/Pritchard, AP/ABC News, Oct. 5). **-- SP**

RAIL:

Amtrak train partially derails in Vt.

Published: Monday, October 5, 2015

Two cars of an Amtrak train en route to Washington, D.C., derailed in Vermont this morning, injuring several passengers, according to news reports.

The derailment occurred at about 10:30 a.m. today when two rain cars went over an embankment, according to Montpelier, Vt., fire officials. CNN reported that at least four passengers were injured, though Amtrak said in a tweet that it had not heard of any life-threatening ones.

The train was traveling from St. Albans in northern Vermont.

"We are aware of the derailment of train 55 in VT," Amtrak said in a tweet. "Emergency personnel are on the scene & we are assessing the situation" (Brad Evans, WPTZ, Oct. 5). **-- BTP**

FRANCE:

Government mulls ending diesel tax break

Published: Monday, October 5, 2015

France is considering phasing out tax breaks for diesel fuel over the next five years to encourage drivers to choose cleaner cars, Environment Minister Ségolène Royal said.

Health warnings and the revelation last month that Volkswagen cheated om emissions tests in the United States have put diesel-promoting countries such as France in an awkward position in recent years (*ClimateWire*, Sept. 21).

Royal had rejected calls to ban diesel or raise taxes on it in recent weeks, but relented yesterday.

"We need to start preparing our move out of diesel right now," she told France 5 television. "We should phase out diesel's [tax] advantage over five years." The diesel tax is currently 15 euro cents per liter lower than that on gasoline.

Diesel exhaust was classified as carcinogenic in 2012 by the World Health Organization (*E&ENews PM*, June 12, 2012).

Diesel vehicles currently make up more than half of French cars, though sales have fallen in the past three years (Trompiz/Labbe, Reuters, Oct. 4). **-- BTP**

POWER PLAN HUB:

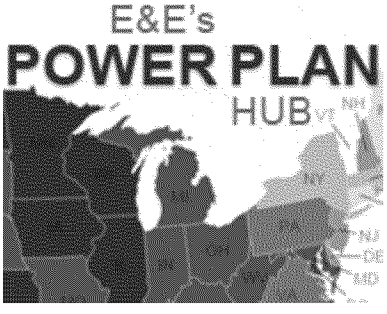
3 states kick off stakeholder planning meetings

Emily Holden and Rod Kuckro, E&E reporters

Published: Monday, October 5, 2015

Arkansas, Georgia and Minnesota are among the states that this week will begin stakeholder meetings on the Clean Power Plan.

Today, the Missouri Energy Initiative will host a conference in St. Louis, and two sessions will focus on the Clean Power Plan. One will feature the chairman of the Missouri Public Service Commission, Daniel Hall, and the chairman of the Michigan PSC, John Quackenbush. The other will examine grid reliability with officials from the Southwest Power Pool and the Midcontinent Independent System Operator. E&E's Jeff Tomich will report on the event.



On Wednesday, U.S. EPA acting Assistant Administrator Janet McCabe will be the sole witness at a hearing of the House Energy and Commerce Subcommittee on Energy and Power on the agency's carbon rules. In announcing the hearing, subcommittee Chairman Ed Whitfield (R-Ky.) said he expects a "thoughtful discussion" on the effective imposition of cap-and-trade requirements on the power sector.

Also Wednesday, the North Carolina Sustainable Energy Association's annual "Making Energy Work" conference in Raleigh will feature a session on the state's "next steps" on the Clean Power Plan. Panelists will include officials from the North Carolina Utilities Commission and the Arkansas Department of Environmental Quality. E&E's Kristi Swartz will be reporting.

On Thursday, Georgia's Environmental Protection Division will host a stakeholder meeting "examining the final Clean Power Plan." Speakers include Karen Hays, EPD's air branch chief; Judson Turner, head of the EPD; Public Service Commission Chairman Chuck Eaton; and David Hoppock from the Nicholas Institute for Environmental Policy Solutions. They are going to review the EPD and PSC's role in developing a state plan, as well as compliance options and EPA's Clean Energy Incentive Program. E&E's Swartz will be reporting.

Also Thursday, the Minnesota Pollution Control Agency will convene a stakeholder meeting in St. Paul. It will include an analysis of the rule and an update on multistate meetings. E&E's Daniel Cusick will be there.

On Friday, a trio of Arkansas agencies will begin meeting with stakeholders to discuss the final EPA carbon "emission standards for existing power plants, study the efficacy and economic impacts of potential carbon reduction measures from the power sector, and develop a state strategy for Arkansas." The Little Rock meeting is hosted by the Department of Environmental Quality, the Public Service Commission and the Arkansas Economic Development Commission. E&E's Edward Klump will be there.

The latest Clean Power Plan news

In case you missed it:

- Texas utility regulator Brandy Marty Marquez says writing a compliance plan would be a "waste" of time (*EnergyWire*, Oct. 2).

- Southern state lawmakers urged attorneys general to sue EPA and governors to reject submitting a compliance plan (*EnergyWire*, Oct. 2).

- A federal appeals court rejected another effort by Clean Power Plan opponents to stymie the rule (*Greenwire*, Sept. 30).

- State officials cautioned about the consequences of just saying no to EPA (*ClimateWire*, Sept. 30).

- A Georgia air official says the state will develop a compliance plan that allows interstate trading of carbon (*EnergyWire*, Sept. 30).

- North Carolina's Energy Policy Council is exploring the construction of new nuclear plants as a means to comply with the Clean Power Plan (*EnergyWire*, Sept. 28).

C2ES report examines business resilience to impacts of climate change

Published: Monday, October 5, 2015

Are businesses in the United States successfully translating climate change data into action to reduce risk? During today's OnPoint, Janet Peace, senior vice president at the Center for Climate and Energy Solutions, discusses a new report examining businesses' resilience to the impacts of climate change. She talks about the public infrastructure challenges facing businesses and explains how public-private partnerships could help facilitate the planning process.

Reports: Volkswagen investigation focusing on development managers

The Associated Press 10/5/15

BERLIN – As the U.S. Congress prepares to question Volkswagen officials in Washington over its manipulation of American emissions tests, German media are reporting the company itself is

focusing on three development managers who have been suspended.

Bild newspaper reported Sunday that Heinz-Jakob Neusser, head of development at VW, and engineers Ulrich Hackenberg and Wolfgang Hatz had been put on forced vacation in the wake of the scandal. Other newspapers had similar reports.

Hatz declined comment through a spokesman and neither of the other two responded to emails seeking comment. VW spokesman Eric Felber on Monday refused to comment on "various public speculation."

Bild reported that VW's internal investigation had turned up contradictory information on Hackenberg's possible involvement, while Hatz denied knowledge.

From 2002 to January 2007, Hackenberg was in charge of concept development, superstructure development and electronics at VW subsidiary Audi. In 2007 he was appointed a member of the VW brand's board for development, and has been a member of Audi's management board since July 2013. He had responsibility for technical development of all of the VW group's brands.

Hatz joined the VW group in 2001 and served as head of engines and transmissions development at Audi until 2009, while assuming the same function at VW in 2007. In February, 2011 he became a member of Porsche's board of management in charge of research and development and is also head of engines and transmissions development for the Volkswagen group.

VW and Porsche merged in 2012 after years of wrangling.

Neusser was in charge of drivetrain development of Porsche from 2001 to 2011 before joining VW to head powertrain development there, taking over the job for the whole Volkswagen group in 2012. The next year, he was named management board member for the Volkswagen brand in charge of development.

VW's top manager in the US, Michael Horn, is to testify before Congress on Thursday.

Volkswagen pollution test site in Oxnard under scrutiny amid cheating scandal

Gillian Flaccus and Justin Pritchard 10/5/15

OXNARD – When Volkswagen opened its gleaming pollution testing center near the California coast, a top executive from the German automaker helped snip the blue ribbon and joined a tour of a lab so advanced that VW would brag the air inside was cleaner than in the surrounding strawberry fields.

Three years later, with VW admitting that it manipulated emissions results in 482,000 U.S. diesel vehicles to make them seem more environmentally friendly, questions are swirling around Volkswagen's only test center in North America. Was anyone at the facility complicit in the scheme? Or were VW's own testers unaware of the deception like so many others?

The center in Oxnard, about 60 miles northwest of Los Angeles, was built with the help of a $10 million, tax-exempt public bond and opened in 2012.

Volkswagen saw the facility as key to its multibillion-dollar U.S. growth strategy, partly because vehicles would have the selling point of meeting the nation's strictest emissions standards. At the facility, VW runs cars through a battery of tests to check whether they're polluting as little as advertised.

While no evidence has surfaced that Oxnard played a role in the fraud, the test center is sure to attract interest from government investigators and private attorneys lining up to sue VW.

"That would be one of the top facilities on my list to get inside of, whether through a subpoena or a search warrant," said William Carter, a former federal prosecutor in Los Angeles who specialized in environmental crimes. "You'd want to explore what's there."

Carter said that investigators would want to know whether anyone in Oxnard knew about the "defeat devices" that Volkswagen has acknowledged installing on models from 2009 through 2015. The "device" was code in engine software that cheated diesel car emissions tests in the U.S.; 11 million engines worldwide contained the software. The scandal forced out VW's CEO and could lead to $18 billion in U.S. fines, an avalanche of lawsuits and criminal prosecutions both here and abroad.

California has launched its own criminal probe, but the state Attorney General's office would not say if Oxnard was a focus. A U.S. Justice Department spokesman said prosecutors are working closely with U.S. Environmental Protection Agency investigators but declined to say more.

Two Southern California law firms have cited the center in lawsuits against VW.

"I'm dying to know if they were doing anything in that facility" related to the defeat device, said attorney Graham LippSmith, who is seeking damages for fraud and negligence in federal court in Los Angeles on behalf of VW diesel owners in California.

Volkswagen declined to answer questions about what it calls Test Center California, instead providing a fact sheet first distributed at the 2012 opening attended by local dignitaries and VW officials. It denied a tour request, and security escorted out an Associated Press reporter who visited.

California officials who began investigating discrepancies in VW's diesel emissions months ago are familiar with the test center. The California Air Resources Board, in charge of enforcing the state's tough emissions standards, has likely received test results from the center but spokesman John Swanton could not be sure and would not say whether they included the 2009 to 2015 diesel models in question.

In recent weeks, agency staff visited Oxnard for ideas about how to upgrade their own aging emissions test center in El Monte, about 80 miles away, according to Swanton. The visit came while state and federal regulators were pressing VW to explain emissions test discrepancies but was not part of the investigation, he said.

The agency has researched other automaker test labs in California for ideas and was interested in the VW facility's top-notch environmental design, which includes rooftop solar paneling that provides one-third of its electricity.

And the agency is currently collaborating with VW to test emissions from a diesel research vehicle outside the lab. Air Resources Board engineers have been driving a red VW Golf up and down the coast to Oxnard, taking pollution readings using equipment strapped onto the back. The idea is to test ideas that VW is considering for a possible future diesel model, Swanton said.

Paperwork submitted to the City Council in 2010 as part of the approval process for a $10 million California Economic Development Authority tax-exempt bond to build the $27 million center said it would include "sophisticated emission-testing equipment" as part of VW's research to develop ultra-low emission vehicles, including diesel. VW came to Oxnard to replace a smaller, older facility nearby.

Civic leaders in Oxnard received a tour in 2012 that focused on how the precision lab assesses engine performance and its impact on emissions, said Steven Kinney, former president of the Economic Development Corporation of Oxnard.

The floors were so clean you could eat off them, Kinney said. He peered into a climate-controlled chamber where engineers could simulate sub-zero temperatures or desert conditions and saw cars undergoing emissions testing on treadmills.

At the Oxnard facility, and those like it that other automakers have in Southern California, cars would typically be several years old — tested for how they are performing as they age. Testing to certify that a new model meets U.S. and California emissions standards is typically done at an

automaker's headquarters.

"They were proud of the fact that the air inside the facility was cleaner than the ambient air," he recalled.

Now, Kinney is left with questions: "How are they going to react to this? How much are they going to now open up the facility to broader public scrutiny?"

AP (via Register-Herald)

http://www.register-herald.com/news/state_region/west-virginia-files-complaint-over-volkswagen-emissions/article_8f3e0b84-616d-51e8-b7b0-437f285e93c7.html

West Virginia files complaint over Volkswagen emissions

10/5/15

CHARLESTON (AP) — The West Virginia Attorney General's Office has filed a civil complaint against Volkswagen of America, Inc. over the automaker's emissions-rigging scandal.

The Kanawha County Circuit Court complaint alleges that the company violated the West Virginia Consumer Credit and Protection Act. It seeks civil penalties of $5,000 per violation and costs related to the investigation, litigation and administration of the matter.

The complaint also seeks refunds for West Virginia consumers who bought Volkswagen's TDI clean diesel vehicles.

U.S.-based Volkswagen spokeswoman Jeannine Ginivan said Monday that the company doesn't

comment on pending or active litigation.

The German automaker has admitted it rigged diesel emissions technology to pass U.S. smog tests.

Attorney General Patrick Morrisey announced the complaint on Monday in a news release.

Bloomberg

Evoking 'Think Small' Urged as Primary VW Message Post-Crisis

Kristen Schweizer and Elisabeth Behrmann 10/5/15

In the 1950s and '60s, when bigger meant better in American consumer culture, Volkswagen built its brand with ads that poked gentle fun at its diminutive vehicles. One early campaign featured a tiny

Following revelations the company rigged emissions tests for millions of its diesel engines, Volkswagen should use simple ads that hark back to those early days to rehabilitate its tarnished image, marketing and crisis-communications professionals say.

"Once they get the facts straight, they need to communicate in a very clear way how they will fix the problems and apologize, but just once,'' said Brian Elliott, chief executive officer at ad agency Amsterdam Worldwide, which has worked for VW and was a finalist last year in a contract with Skoda, its Czech brand.

Elliott points to General Motors Co. as an example. Faulty ignition switches in GM cars have been blamed for more than 100 deaths, and the company has agreed to pay $900 million to settle a criminal probe by the U.S. Justice Department over the issue. Elliott praised CEO Mary Barra

for openly addressing the situation.

“She was front and center, going in front of Congress, the press and the industry,” said Elliott. “She did not shy away from what the moment demanded of a leader. And that has surely helped salvage GM’s reputation.”

Volkswagen has hired U.S. law firm Kirkland & Ellis LLP, which led BP Plc’s defense in the criminal investigation of the 2010 Deepwater Horizon oil disaster, to help it deal with the widening scandal. But VW declined to say whether it has sought outside help to shape its messaging.

The company has removed some advertisements and delayed or changed others, according to spokesman Nicolai Laude. “We’ve taken a close look at our advertising and marketing

strategy due to the current events," he said. "We’ve adjusted certain aspects accordingly.

‘Just One Thing’

A campaign promoting the new Touran small sport utility vehicle has been scaled back due to the crisis, and full-page ads in German papers marking the 25th anniversary of German reunification this weekend addressed the scandal.

“We were planning to say here how happy we are Germany has become one country again," read the ads, just unadorned text on a white background. "But now we want to say just one thing: We’ll do everything to regain your trust.”

According to Brand Finance, a London marketing consultancy, the value of the Volkswagen brand has dropped by $10 billion, to $21 billion, and the company risks losing its ranking as the third most valuable automotive nameplate, behind Toyota and BMW.

“The brand will be repairable, but it’s certain the impact will be massive,’’ said Jim Prior, CEO of London branding consultant Lambie-Nairn. “They will have to live with the legacy of being a

brand that has cheated.''

Though VW was criticized for running ads touting its green credentials after news of the cheating broke, Prior cautions against halting advertising altogether. For starters, it's tough to do: Billboards and magazines are typically booked weeks or months in advance, and Websites, television stations, and daily newspapers would likely charge hefty cancellation fees if they can't resell the space.

More important, though, is that Volkswagen remain in the public eye to remind consumers of all of the positive feelings once evoked by the brand and bury the unsavory taste of scandal. The tone must be simple, serious and somber, yet remind the public Volkswagen makes great cars. "They should focus on that story," Prior said, "although don't claim fuel economy as part of the story."

Unpopular Figures

Stuart Leach, who heads the crisis department at Bell Pottinger, a London public relations firm that has worked with unpopular figures such as Belarus President Aleksandr Lukashenko and South African apartheid-era leader F.W. de Klerk, said Volkswagen must show real concern about the situation, accept full responsibility, and vow it will never happen again -- in a believable way. The company needs to separate the brand from the scandal, and it isn't yet moving quickly enough to achieve that, Leach said.

"Brand trust right now is out the window,'' Leach said. "Narratives get set very quickly and once they are set it's difficult to shift them. And Volkswagen doesn't have a compelling one now.''

Bloomberg

http://www.bloomberg.com/news/articles/2015-10-05/schwarzman-says-heroic-volkswagen-scandal-will-be-temporary

Schwarzman Says 'Heroic' Volkswagen Scandal Will Be Temporary

Devin Banerjee Margaret Collins 10/5/15

Volkswagen AG's admission that 11 million of its diesel vehicles use software to cheat emissions tests won't threaten the carmaker's existence, said Blackstone Group LP's Steve Schwarzman.

Volkswagen shares will suffer from the scandal, but in the long run, the company has loyal customers, Schwarzman, chief executive officer of New York-based Blackstone, said in a television interview Monday on "Bloomberg <GO>" with David Westin and Stephanie Ruhle.

"This is obviously a heroic problem, but ongoing they make terrific products," Schwarzman said. "This will work its way through the legal system in some time. It just will be a very unfortunate time for their securities."

The Wolfsburg, Germany-based company's stock has plummeted almost 40 percent since Sept. 18, when the Environmental Protection Agency accused Volkswagen of using the software. The carmaker's designated chairman, Hans Dieter Poetsch, has warned managers that the diesel-emissions scandal could pose "an existence-threatening crisis for the company," as it pleaded for public trust with full-page ads in national newspapers.

"There will be a price to pay," said Steve Rattner, chairman of Willett Advisors, speaking on the same show. "This will be a bit like BP, where they will certainly have to pay. I don't think the company is going to go out of existence."

Willett handles the personal and philanthropic assets of former New York Mayor Michael R. Bloomberg, the majority owner of Bloomberg LP, the parent of Bloomberg News.

Bloomberg

http://www.bloomberg.com/news/articles/2015-10-05/fiat-chrysler-offers-1-700-cash-for-volkswagen-clunkers

Fiat Chrysler Offers $1,700 Cash to Lure Volkswagen Drivers

Tommaso Ebhardt 10/5/15

Fiat Chrysler Automobiles NV is seeking to lure customers away from Volkswagen AG with rebates of as much as 1,500 euros ($1,700) in Italy amid the German competitor's woes over cheating on emissions tests.

Fiat Chrysler is offering the discounts on top of other incentives on the trade-in of a car from any of Volkswagen's brands, according to an internal memo published in Il Giornale daily that was confirmed by dealers. A spokesman for the Italian-U.S. manufacturer in Turin declined to comment.

While brand-swap discounts aren't unusual, offers that specifically target one company are rare. Fiat's pitch comes as Volkswagen reels from the biggest crisis in its history, and continues an antagonistic relationship between the two carmakers. Fiat Chrysler Chief Executive Officer Sergio Marchionne accused VW in 2012 of creating a "bloodbath" in Europe with its pricing strategy as manufacturers struggled with a market slump. VW responded by threatening to leave the ACEA, the industry's main lobby in the region, which was headed by Marchionne at the time.

The ACEA, of which VW is still a member, is now part of the growing isolation of Europe's biggest carmaker, which admitted Sept. 18 to installing a "defeat device" in diesel-powered cars designed to fool emissions testers about performance. The association said Sept. 23 that there was "no evidence" other manufacturers are deliberately duping regulators. Volkswagen's stock has continued to decline since the revelation, while European competitors' shares have started to recover.

Incentives that Fiat Chrysler is offering during October to Italian VW customers range from 500 euros for a Fiat Panda subcompact to 1,500 euros for a Jeep Grand Cherokee.

Fiat sent another memo to distributors last week to reassure customers that it "fully complies" with all testing rules and its vehicles are "not equipped with defeat devices," according to a copy obtained by Bloomberg.

Automotive News Europe reported Monday that U.S. manufacturer Ford Motor Co. is providing a 750-euro trade-in bonus across its model range that's also targeted at Italian drivers of Volkswagen cars. Calls and e-mails to Ford's spokespeople in Europe weren't immediately answered after the close of business hours.

Volkswagen's stock has plunged 42 percent since Sept. 18. The shares are down 13 percent in the past week, in contrast to gains of 8 percent for Fiat Chrysler in Milan, 3 percent for Paris-based PSA Peugeot Citroen and 2.9 percent for German luxury-car producer BMW AG.

The VW brand ranks second in Italy to the Fiat nameplate. The German marque's Italian deliveries fell 1.4 percent in September, while Fiat's jumped 24 percent.

Daily Herald

Pyke: Volkswagen cheating bomb hits VW owners hard

Marni Pyke

There's nothing like German engineering, except of course when that ingenuity extends to rigging Volkswagens to pass U.S. emissions tests.

That harsh reality is dumbfounding suburban VW owners who learned last month their beloved diesel-powered Beetles, Jettas and Golfs are Trojan horses defying the Clean Air Act by burping pollutants into the air.

"It very much felt like a punch in the gut," said Tom Janiszewski, who owns six Volkswagens and commutes from Woodstock to Round Lake in a 2013 Beetle Convertible TDI.

"I'm going through the five stages of grief. First denial, then 'OK, it is happening,' anger, and now I'm embarrassed because I've been a champion of the brand for years."

Sadly, there is no quick fix in sight for VW Nation as the U.S. Environmental Protection Agency and Justice Department investigate and Germany-based Volkswagen triages.

"For at least six years, VW has been installing illegal software in some of its diesel passenger cars," EPA spokeswoman Christie St. Clair said.

An announcement about recalls is expected in the future, but for now owners of affected diesel-powered VWs made between 2009 and 2015 should hang tight, the EPA says. About 11 million vehicles globally are affected. VW has suspended sales of all 2-liter, 4-cylinder, TDI-equipped vehicles.

Dealers nationwide were blindsided by the news, which did not involve all models. So far, my calls to dealerships in Bensenville and Libertyville haven't been returned.

Volkswagen has promised a remedy but admits it will take time because it's coordinating with the government.

The waiting is tough for 2012 Volkswagen Golf TDI owner David Corona of Gurnee.

"I really do love the car," he said. "I purchased it because it's one of the few manufacturers that sells diesel-powered cars in the U.S. You definitely feel the torque."

Diesel is a different animal than conventional gasoline, explained Argonne National Laboratory's Don Hillebrand, Center for Transportation Research director.

"Gas is a highly refined fuel. Diesel is a thicker substance," Hillebrand said. "The contents are long carbon chains that contain more unrefined products. Combustion comes at higher temperatures and pressures. That gives you efficiency, but it's also what causes poisonous substances to form."

When diesel burns it emits nitrogen oxides, which contribute to smog and can cause coughing or eye and throat irritation when people are exposed at low levels, experts say.

The illegal software tricked emissions tests into thinking diesel cars met the standards that protect clean air, St. Clair said. A so-called defeat device activated emissions controls that trap nitrogen oxide and turned them off under normal driving conditions.

The deception gives diesel Volkswagens the illusion of great mileage and power in a tree-hugging package.

Janiszewski bought his Bug, which gets 45 to 50 mpg, "because of the fuel economy" and because "it's a very fun machine to drive."

"I hope the fix is not going to compromise the performance or fuel economy," he said.

Corona has similar qualms. "I can't help but feel there will be some sort of performance degradation," he said.

Something's got to give, warns Wheaton's John Walton, vice chairman of Chicago Area Clean Cities, a clean fuel/vehicle educational group.

"If you repair the problem so it meets the emissions standards, I'm guessing you'll get a lower mpg," he said.

That's unfortunate for Hope Haberer of Glen Ellyn, who's enjoyed her peppy 2013 Jetta SportWagen -- until now.

"We bought it for the high mileage and because it was a VW. I don't know what we'll do now," she said. "I worry about the trade-in value."

Also lost is her pride in driving a green car.

"It means I don't have as good a feeling about VW," said Haberer, a Volkswagen loyalist who's ready to switch.

Corona's family is very environmentally conscious. That's why the Golf attracted him and why he hasn't told his idealistic 7-year-old daughter the bad news. "She probably won't like it," he said.

But Volkswagen will bounce back, Janiszewski predicts, partly because "they've taken action right away. They didn't deny it. The TDI community is a hardy bunch."

What would Herbie do?

Here's more information on the Volkswagen emissions test scandal:

• So far diesel cars made between 2009 and 2015 are affected.

• Specific vehicles affected include: 2009 to 2015 Jettas TDIs; 2009 to 2014 Jetta SportWagen TDIs; 2010 to 2015 Golf TDIs; 2015 Golf SportWagen TDIs; 2012 to 2015 Beetle TDIs and Beetle Convertible TDIs; and 2012 to 2015 Passat TDIs.

• The deception was uncovered by a team of West Virginia University researchers.

• The EPA estimates nitrogen oxides being emitted from diesel VWs as a result of the fraud are 10 to 40 times higher than permitted by law.

• TDI stands for turbocharged direct injection.

For more information, check out the EPA and Volkswagen websites at www3.epa.gov/otaq/cert/violations.htm and vwdieselinfo.com/.

Edmunds

http://www.edmunds.com/car-news/volkswagens-top-us-executive-to-face-lawmakers-this-week.html

Volkswagen's Top U.S. Executive To Face Lawmakers This Week

Anita Lienert 10/5/15

Volkswagen Group of America President and CEO Michael Horn and the Environmental Protection Agency are scheduled to testify before a Congressional oversight panel on October 8, as American consumers are still waiting for a formal recall of 482,000 Volkswagen vehicles included in the cheating scandal on diesel-emissions tests.

The hearing is entitled "Volkswagen's Emissions Cheating Allegations: Initial Questions."

Lawmakers said they want to know the "facts and circumstances surrounding Volkswagen's reported Clean Air Act violations and what they mean for consumers and the general public."

Volkswagen's reputation has taken a major hit with car shoppers, according to a new study released late last week.

Consulting firm AutoPacific said only one out of four vehicle owners have a positive opinion of Volkswagen following its cheating scandal, compared to three out of four prior to hearing the news.

The Congressional hearing and AutoPacific study follow the EPA's September 18 revelation that Volkswagen had added software code to its digital engine controllers to comply with emissions requirements during testing. But during real-world driving conditions, the vehicles produced as much as 40 times the allowed level of pollutants.

"The American people want to know why these devices were in place, how the decision was made to install them, and how they went undetected for so long," said Rep. Tim Murphy (R-Pa.), chairman of the Subcommittee on Oversight and Investigations, in a statement. "We will get them those answers."

The subcommittee is expected to post Horn's written testimony on its Web site prior to the hearing.

September sales numbers released on October 1 by Volkswagen of America showed a slight gain compared to the same month a year ago. But the overall auto industry recorded a double-digit gain for September.

The cheating scandal involves certain Volkswagen vehicles equipped with 2.0-liter four-cylinder TDI engines.

The vehicles include the 2012-'15 Volkswagen Passat TDI, 2009-'15 Volkswagen Jetta TDI and 2009-'14 Volkswagen Jetta SportWagen TDI.

The 2010-'15 Volkswagen Golf TDI, 2015 Volkswagen Golf Sportwagen TDI and 2012-'15 Volkswagen Beetle TDI and Volkswagen Beetle Convertible TDI are also included.

Volkswagen previously said it is "committed to finding a remedy as soon as possible."

The German automaker also restructured its North American operations last week. Starting on November 1, Skoda chief Winfried Vahland takes over as CEO of the new Volkswagen North America Region.

Fortune

http://fortune.com/2015/10/05/circling-the-volkswagens/

Circling the Volkswagens

The German automaker has a very big problem on its hands.

Alan Murray 10/5/15

It's still early days, but the Volkswagen story is shaping up as a case study in how not to handle a crisis.

Volkswagen recognizes it has a very big problem on its hands. Germany's Welt am Sonntag quotes Hans Dieter Potsch, the incoming chairman, calling it an "existence-threatening crisis for the company."

But the fact that Potsch, VW's chief financial officer since 2003, was given the chairman's job, and that another company insider, Matthias Müller, has been named CEO, suggests the board is circling its Volkswagens. The FT contrasts that defensive crouch with how Siemens handled its bribery scandal in 2006, bringing in an outside chairman and CEO, and ultimately taking legal action against former executives.

Emerging evidence makes it clear that the installation of software to defeat emissions controls was not the result of some rogue operation – it was driven by decisions made by the company's top engineers and approved at the highest levels. It is a bright neon sign pointing to a sick corporate culture. That won't be easy to change, and it won't be solved by papering the world with apologetic newspaper ads.

Potsch and Muller may want to learn from GM's Mary Barra, also an insider, who when faced with the ignition switch scandal was surrounded by fellow executives who also said: This is bad, but we can get over it. Barra's response: I don't want to get over it.

"I don't want to set it aside and explain it," she told Fortune's Geoff Colvin last year, "because I think it has uncovered some things in our company that it's critical we challenge ourselves to change and to fix."

Fortune

http://fortune.com/2015/10/05/volkswagen-engineers-scandal/

These 2 Volkswagen engineers are at the center of the emissions probe

Daniel Roberts 10/5/15

The men were 'top aides' to former CEO Martin Winterkorn.

As the probes and lawsuits pile up, Volkswagen's own internal probe into deceptive engine software is honing in on two individuals.

According to a Wall Street Journal report, the company is centering its efforts on former Audi engineer Ulrich Hackenberg and former Porsche engineer Wolfgang Hatz, who were both among a number of engineers suspended during the investigation.

The two men were "top aides" to former Volkswagen CEO Martin Winterkorn during his time at Audi, before he took over at VW. When he joined VW, he put the duo in charge of R&D. (He has since resigned in light of the scandal.)

Volkswagen has a lot more to worry about than its own internal findings. U.S. chief Michael Horn will appear in front of a Congressional committee this week, while France and Italy have each launched formal probes into who manipulated the company's diesel emissions data and who knew about it.

Some 11 million Volkswagen cars are included in the recall, with only half a million of them in the U.S. While VW may still evade formal charges in the States, lawsuits have come quickly.

Huffington Post UK

http://www.huffingtonpost.co.uk/harry-quilterpinner/volkswagen_b_8243156.html

Volkswagen's 'Diesel Dupe': A Scandal of Public Health and Government Policy

Harry Quilter-Pinner 10/5/15

The government should use the Volkswagen scandal to promote alternatives to both petrol and diesel cars - and save thousands of lives in the process.

The recent Volkswagen scandal - which saw the car company admit that emissions from its diesel cars were higher than previously thought - has hardly left the headlines over the last few weeks.

While public anger initially focused on the level of corporate greed and deception displayed by Volkswagen, attention is now beginning to turn to the implications for public health and government policy.

This saga is primarily a scandal of public health. Unlike petrol engines, diesel engines fail to burn away leftover nitrogen dioxide and tiny particles made up of acids, chemicals and dust. This means they contribute a lot more to air pollution which is a major cause of ill health.

It is estimated that around 500,000 deaths a year are linked to air pollution across Europe, a quarter of which are caused by diesel emissions. There is also evidence to suggest that extended exposure to NOx and particulates - as experienced by most Londoners - can exacerbate asthma and stunt growth in children.

Volkswagen's admission that it systematically cheated emissions tests therefore has big implications for our nation's health. But we should not let this deflect attention from the fact that government policy is also to blame for the growing reliance on diesel engines. In the past, governments have actively promoted the use of diesel engines. This is because they remove more carbon than petrol engines during combustion - helping the country to meet its carbon emissions targets in the process.

Successive European governments have promoted the use of diesel for almost 20 years, explicitly tolerating poorer air pollution in a trade-off to reduce carbon emissions. This growing use of diesel engines contributes towards 123,000 deaths per year (compared to less than 2000 as a result of the extra admissions from the VW scandal). Indeed, the UK is one of the worst

culprits as highlighted by this government's admission that it will be 20 years late in meeting NOx emission targets.

This promotion of diesel is partly explained by the reaction of European governments to the 1997 Kyoto agreement which saw most developed countries legally obliged to reduce CO2 emissions by an average of 8% over 15 years. Decreasing the use of petrol cars and replacing them with diesel was seen as a quick way to deliver on these promises.

As a result, European governments have taxed cars based on CO2 emissions but not NOx emissions or particulates, promoted the use of diesel for public transportation systems and put in place legislation to force car producers to reduce their contribution to CO2 emissions without promoting a genuinely clean alternative. The result was that diesel cars went from 10 per cent of the total fleet in the mid 90's to around 50 per cent today. The 'diesel dupe' is therefore as much government's as it is the private sector's. They chose to take the easy way to reduce carbon emissions and ignored public health concerns in the process.

There are a number of actions the government could take to address this problem.

First, governments should focus on removing, or even reversing, the state backing of diesel. This should include changing taxes on fuel and road usage to factor in both C02 emissions and other pollutants such as NO2 and particulates, and should also include increased congestion charges on diesel cars (as promoted by the Mayor of London) with a long term aim of an outright ban (as promoted by the Mayor of Paris).

Second, policy should ensure that we do not pivot back to petrol. To do so would simply be trading lives in the future (in the form of increased CO2 emissions) for lives now (in the form of reduced NOx emissions). Instead, European countries should do what some Asian countries did in the wake of the Kyoto agreement: invest in electric and hydrogen alternatives to both diesel and petrol. This should include more government financing for research and development into the green transport sector, in a bid to attract the private sector to follow suit.

Third, given that progress in the field is already reasonably advanced - Toyota recently launched its hydrogen fuelled Mirai whilst Nissan has invested in battery operated cars such as the Leaf - governments should also be the first customers in the queue, swapping diesel fuelled public transport (busses, Lorries, trains) for greener alternatives.

The transition won't happen overnight. However, if backed by sufficient funds and political capital, it could radically speed up the shift the renewables and save lives now and in the future.

International Business times

http://www.ibtimes.com/volkswagen-emissions-scandal-new-chief-warns-existence-threatening-crisis-company-2126459

Volkswagen Emissions Scandal: New Chief Warns Of 'Existence-Threatening Crisis For The Company'

Suman Varandani 10/5/15

Volkswagen AG's new chairman Hans Dieter Poetsch warned that the company could face an "existence-threatening crisis" over the massive emissions scandal, media reports said, citing Welt am Sonntag newspaper.

The German carmaker has time until Wednesday to fix some 2.8 million diesel vehicles equipped with software to cheat on emissions tests, in its home market. Poetsch's comments come after he told managers last week he was certain that Volkswagen will overcome the crisis, Bloomberg reported, citing Welt am Sonntag. The German automaker was found to have installed so-called "defeat devises" on its cars that would reduce emission levels during tests.

Two top Volkswagen engineers who found they couldn't deliver as promised a clean diesel engine that could meet pollution standards in the United States and other countries are at the center of the probe into the installation of the software, which was designed to fool regulators, the Wall Street Journal reported, citing people familiar with the matter.

The two men, Ulrich Hackenberg, Audi's chief engineer, and Wolfgang Hatz, developer of Porsche's Le Mans racing engines, were among the engineers suspended in the investigation,

according to the sources.

Last month, the Environmental Protection Agency (EPA) accused Volkswagen of using software that allowed its diesel vehicles to emit pollutants above legal limits except when they were subjected to emissions tests. Last week, Volkswagen revealed that as many as 11 million vehicles carry the emissions-rigging software. The revelations triggered inquiries into the carmaker's practices in several countries around the world.

German authorities, however, have not launched a formal inquiry against Volkswagen's former CEO Martin Winterkorn, who stepped down after the cheating came to light. No specific individuals have so far been targeted in the official investigation into the massive emissions scandal.

"Our company was dishonest with the EPA, and the California Air Resources Board, and with all of you," Michael Horn, head of Volkswagen America, told dealers last month in New York City. "We've totally screwed up."

The cheating scandal has brought down the company's market value by 42 percent since Sept. 18, and during Monday's trade, Volkswagen stock went down as much as 4 percent in Frankfurt.

Jalopnik.com

http://jalopnik.com/volkswagen-wiped-diesels-from-their-u-s-website-1734668021

Volkswagen Wiped Diesels From Their U.S. Website

David Tracy 10/05/15

Volkswagen is in some deep stuff right now. So deep, in fact, that they just deleted diesels from their website.

Volkswagen's turmoil is pretty serious right now. We writers came up with the silly "Dieselgate" name, and lets be honest, anytime the media slaps "gate" at the end of anything, you know there's trouble.

If you open up VW's website, you'll find nary a mention of diesels and you won't find most their questionable TDIs on their car configurator (the Touareg TDI is the only one left)—crazy considering how just a month ago VW was touting their diesels as the second coming.

On one hand, since you can't buy one, it makes sense that you can't configure one. But on the other hand, many automakers offer configurators for vehicles not yet on the market. Volkswagen's diesels will come back at some point, so why delete them from the website?

Either Volkswagen has no ballpark idea of when diesels will make a comeback, or it's just going to be a really long time from now.

Reuters via CNBC

http://www.cnbc.com/2015/10/05/volkswagen-admits-rigging-of-8m-cars-in-eu-report.html

Volkswagen admits rigging of 8M cars in EU: Report

Reuters 10/5/15

Volkswagen has admitted that 8 million vehicles were fitted with software capable of cheating diesel emissions tests in the European Union, a German newspaper said on Monday, citing a letter the carmaker sent to members of parliament.

The letter — dated Oct. 2 and cosigned by the former government spokesman and current VW chief lobbyist Thomas Steg — says that vehicles with 1.2, 1.6 and 2.0 liter engines are affected, daily Handelsblatt reported in an advance copy of its Tuesday edition.

The authors of the letter apologize "for the wrongdoing of a few individuals" and promise to fully clarify the matters, the paper said.

A spokesman for VW said late on Monday that he did not know about the letter and could therefore not comment.

Volkswagen is under huge pressure to get to grips with the biggest business crisis in its 78-year history, which has wiped more than a third off its share price, forced out its long-time CEO and rocked both the auto industry and German establishment.

Up until now the carmaker has said it will have to refit up to 11 million diesel vehicles worldwide, including 2.8 million in Germany.

New Chief Executive Matthias Mueller will address workers at a staff gathering in Wolfsburg on Tuesday and is expected to brief the supervisory board on Wednesday, a source told Reuters.

Reuters

http://www.reuters.com/article/2015/10/05/us-volkswagen-emissions-idUSKCN0RZ1ZI20151005

VW has no evidence against suspended top engineers: source

10/5/15

BERLIN - Volkswagen has not found any evidence against three top engineers suspended as part of its internal investigation into the rigging of U.S. emissions tests, a source close to the company's supervisory board told Reuters on Monday.

Two sources said the German carmaker's internal inquiry had found employees began to install software designed to cheat diesel emissions tests in 2008, after realizing a new engine developed at great cost would fail to meet both U.S. emissions standards and in-house cost targets.

The inquiry has led to the suspension of more than ten senior managers. Only the names of the three top engineers, all of whom held key positions at the time, have surfaced in media reports.

The three are Heinz-Jakob Neusser, head of technical development at the core VW brand; Ulrich Hackenberg, head of research and development at premium brand Audi; and Wolfgang Hatz, the VW group's engine chief and head of R&D at sports-car brand Porsche.

One source said the internal inquiry, expected to be the main subject of a special board meeting on Wednesday at VW's Wolfsburg headquarters, had not found evidence to accuse the suspended individuals of the manipulation. The investigation is ongoing and VW expects it will last at least several months.

VW, Audi and Porsche all declined to comment, while the individuals could not immediately be reached for comment.

Hackenberg has hired lawyers to contest his suspension, a source close to the matter has told Reuters.

Hatz has told internal investigators he is innocent, but has not taken legal action because he expects the inquiry to clear him of any wrongdoing, said one of the sources, who is close to the supervisory board.

Europe's largest carmaker has admitted to using software to rig diesel emissions tests in the United States. Germany's transport minister says it also manipulated tests in Europe, where VW sells about 40 percent of its vehicles.

It is under huge pressure to get to grips with the biggest business crisis in its 78-year history, which has wiped more than a third off its market value, forced out its long-time CEO and rocked both global car markets and the German establishment.

The head of VW's U.S. business, Michael Horn, is expected to be quizzed about those responsible for the scandal when he appears before a panel of U.S. lawmakers on Thursday.

The two sources said the U.S. hearing was adding pressure on VW to provide concrete information about what caused the scandal.

Germany's KBA watchdog has also set the carmaker an Oct. 7 deadline to say how it will bring its cars into line with emissions standards.

VW has said it will have to refit up to 11 million diesel vehicles worldwide, include 2.8 million in Germany, that contained software capable of cheating emissions tests.

New Chief Executive Matthias Mueller will address workers at a staff gathering in Wolfsburg on Tuesday and is expected to brief the supervisory board on Wednesday, one source said.

VW shares dipped to a 5-year low of 86.36 euros on Monday. They recovered to close up 1.3 percent at 93.52 euros, lagging a 3 percent rise in Europe's blue-chip stock index.

At Volkswagen, a Familiar Figure Returns

Former Chairman Piëch regains influence after being sidelined earlier this year

William Boston 10/5/15

WOLFSBURG, Germany—One day after Volkswagen AG's board forced out Chief Executive Martin Winterkorn over a massive scandal engulfing Germany's largest company, former Chairman Ferdinand Piëch drove triumphantly through the main gates of Volkswagen's massive plant here in his bright red Bentley, chauffeured by his wife, Ursula.

The dramatic return of Mr. Piëch, 78-years-old and one of Volkswagen's largest shareholders, was a turnaround from his sudden resignation as chairman of the supervisory board in April. He was forced to step down when the Prime Minister of the state of Lower Saxony, which holds 20% of Volkswagen's voting stock, and powerful labor representatives on the board blocked Mr. Piëch's attempt to oust Mr. Winterkorn.

Some company insiders saw Mr. Piëch's stylish entrance through Tor Sandkamp, the main entrance to the sprawling headquarters campus and Volkswagen's mile-long factory, as a clear sign that the company patriarch had returned from his Austrian exile and was exerting new influence over company affairs behind the scenes.

Over the past two weeks, as Volkswagen sank deeper into a morass of criminal investigations, regulatory probes and lawsuits, a quiet but forceful shift of power in the upper echelons of one of the world's biggest corporations has taken place.

The wheel is set to turn full circle on Wednesday, when a district court in Braunschweig, just down the road from Volkswagen's headquarters, is expected to appoint Hans Dieter Pötsch chairman of the supervisory board to succeed Mr. Piëch at the request of the company.

The court confirmation follows the appointment on Sept. 25 of another confidant of Mr. Piëch, Porsche Chief Matthias Müller, as Volkswagen's CEO. Messrs. Pötsch and Müller are company veterans with close ties to Mr. Piëch and his cousin Wolfgang Porsche, whose family holding company controls a majority of Volkswagen's voting stock.

The high-level changes strengthen the position of the scions of Beetle designer Ferdinand Porsche and fulfills Mr. Piëch's dream of putting Volkswagen, which last year posted €202.5 billion in revenue and €12.7 billion in operating profit, firmly under family control.

"The Porsche-Piëch family will exert more influence over the company in the future," a person close to the Volkswagen supervisory board said.

As if to emphasize that point, the family holding company, Porsche Automobil Holding SE, increased its stake in Volkswagen on Sept 26, the day Mr. Piëch rode triumphantly through the gates in Wolfsburg to attend a meeting of the holding's supervisory board.

Porsche SE purchased 4.4 million shares of VW's voting stock, of 1.5% of VW's ordinary shares, from Suzuki Motor Corp., which sold the shares after a failed alliance with the German auto maker. The acquisition raised the family's holding to 52.2% of the voting capital, or ordinary shares, and 32.4% of the company's subscribed capital. The family said it considered the acquisition "a strong commitment to its core investment and emphasizes its role as an anchor shareholder in the Wolfsburg-based car maker."

In addition to his role as finance chief of Volkswagen, Mr. Pötsch also serves as the finance chief of Porsche SE. The holding is listed and its shares tend to track those of Volkswagen. A native Austrian, like Mr. Piëch, people who know the family say that he has a close relationship with Mr. Piëch and Mr. Porsche.

Porsche SE came to control a majority stake in Volkswagen through an attempt by Mr. Porsche and Mr. Piëch to use car maker Porsche AG to take over the much larger Volkswagen group. In the end, the family holding acquired a majority in Volkswagen, which took control of the Porsche sports car maker.

The deal saddled the family with debt leaving them close to insolvency. Mr. Pötsch arranged a €5 billion ($5.59 billion) capital increase that wiped out the family's debt and made a cash injection into Porsche SE, which the family is now using as an automotive-related venture capital fund.

Though not yet officially appointed as chairman, Mr. Pötsch joined Mr. Müller on Sept. 28 to address a crowded gathering of nearly 1,000 top Volkswagen managers in the auditorium of the company's management training center, the "Auto University."

According to a person present at that meeting, Mr. Pötsch said the emissions cheating scandal had plunged the company into a "crisis that threatens the existence of the company," adding that he was confident Volkswagen would survive the worst crisis in its 78 year history.

AP (via Chattanooga Times Free Press):

http://www.timesfreepress.com/news/breakingnews/story/2015/oct/06/analysis-dozens-deaths-likely-vw-pollution-dodge/328964/

VW pollution scheme may have killed hundreds of people

Analysis shows that dozens of deaths may have happened in U.S.

WASHINGTON -- Volkswagen's pollution-control chicanery has not just been victimless tinkering, killing between five and 20 people in the United States annually in recent years, according to an Associated Press statistical and computer analysis.

The software that the company admitted using to get around government emissions limits allowed VWs to spew enough pollution to cause somewhere between 16 and 94 deaths over seven years, with the annual count increasing more recently as more of the diesels were on the road. The total cost has been well over $100 million.

That's just in the United States. It's likely far deadlier and costlier in Europe, where more VW

diesels were sold, engineers said. Scientists and experts said the death toll in Europe could be as high as hundreds each year, though they caution that it is hard to take American health and air quality computer models and translate them to a more densely populated Europe.

"Statistically, we can't point out who died because of this policy, but some people have died or likely died as a result of this," said Carnegie Mellon environmental engineer professor Peter Adams. He calculates the cost of air pollution with a sophisticated computer model that he and the AP used in its analysis.

Computer software allowed VW diesel cars to spew between 10 to 40 times more nitrogen oxides (NOx) than allowed by regulation, making this "clearly a concern for air quality and public health," said Janet McCabe, acting air quality chief for the U.S. Environmental Protection Agency.

Nitrogen oxides mostly form smog — that murky, dirty air that makes it hard to see and for some people to breathe — but also amplify a deadlier, larger problem: tiny particles of soot. Numerous medical studies show those tiny particles cause about 50,000 deaths a year in the United States, mostly from heart problems.

Nitrogen oxides can travel hundreds of miles, so pollution spewed in Pittsburgh can be felt on the East Coast, Adams said.

Experts calculate how much pollution costs society by looking at the value of lost lives. In this case, Adams and other said the lost lives — valued at $8.6 million apiece — overwhelm other costs such as lost work days or hospital costs. The overall annual cost of the extra pollutants from the VW diesels ranged from $40 million to $170 million, environmental engineering professors calculated.

"Even the small increase in NOx from VW diesel emissions is likely to have worsened pollution along the roadways where they have traveled, and affected the lives of hundreds of thousands of people," said Dan Greenbaum, president of the Health Effects Institute in Boston.

"To say millions of people of people are breathing poor air as the result of that is not off the mark," said Greenbaum, who runs the institute that is funded by both the EPA and the auto industry to serve as an independent arbiter of the science.

In a response Saturday night to an earlier request for comment, Volkswagen said the EPA has noted that the affected vehicles do not present a safety hazard and are legal to drive. "General allegations regarding links between NOX emissions from these affected vehicles and specific health effects are unverified. We have received no confirmed reports that the emissions from such vehicles caused any actual health problem," the company said in a statement.

The calculations should be put in context of air that is getting dramatically cleaner in the United States, experts said. Also, the deaths from extra pollution are dwarfed by the 35,000 people in the U.S. a year who die in auto accidents and are closer to the annual U.S. death toll of spider or snake bites.

The AP calculated how much pollution was spewed year by year, starting with that broad 10 times to 40 times emissions level estimate from the EPA, then factoring in mileage and car number totals from EPA, the car company and Kelley Blue Book.

The results show an upper and lower limit of extra nitrogen oxides pollution allowed by VW's subterfuge. The AP took those figures to scientists who previously created a sophisticated computer program that looks at air movement and numerous epidemiological studies on the health effects of pollutants. The result was a rough estimate on deaths and costs to society based on a certain amount of pollution triggering each death.

The EPA has its own open source computer model that calculates death and social costs of emissions, roughly finding it takes nearly 1,300 tons of nitrogen oxides to cause one death. Using that calculation and AP's emission totals, the total death figures over the past seven years range from 12 to 69, slightly lower than the AP calculations.

The AP ran its calculations and results by more than a dozen experts in emissions, risk and public health. They all confirmed the calculations and results seemed right. One scientist had even done a statistical analysis on his own and came independently to the same conclusion. The experts were mostly university professors or from research institutes. They were not

environmental advocates or representatives of auto companies.

But engineers caution that these figures come with many caveats and are ballpark estimates. They rely on many assumptions and a range of potential emissions per car. Air pollution impacts on people are usually calculated on a local level because that's where it is felt, and it changes from place to place. But these calculations were broadened to a national level, which adds more uncertainty.

The computer simulation that made the death calculations use conservative medical studies as their baseline. Other epidemiological studies would more than double the deaths and health costs, said Adams and model co-creator Jinhyok Heo of Cornell University.

Chris Frey, an engineering professor at North Carolina State University, has been testing the VW diesels in real world conditions, driving more than 100 miles with monitors in the car tailpipes. He found pollution 10 times higher than the federal standard, and noticed that the worst pollution came as he got on to highways and in stop-and-go traffic. Those less desirable areas are where poorer people live, Greenbaum and other experts said.

Since 2008, VW sold more than 10 million VW diesel cars in Europe, compared with less than half a million in the United States. In Europe, the population is more densely packed in urban areas, making them more vulnerable to added air pollution, several experts said.

"Assuming most of the cars are in Europe, it's pretty simple to estimate that it could go as high as hundreds," said Robert Rohde, a physicist and lead scientist at the Berkeley Earth team that has estimated death tolls of air pollution in the past.

VW under pressure for answers as emissions scandal deadlines loom

WOLFSBURG, GERMANY | BY ANDREAS CREMER

Hans Dieter Poetsch's first board meeting as chairman of Volkswagen on Wednesday could turn out to be his most important, coming just hours before a deadline set by German regulators and testimony by the company's top U.S. executive in Congress.

More than two weeks after the carmaker admitted to cheating U.S. emissions tests, Poetsch will be appointed to the helm of the 20-person supervisory board at a specially convened meeting at the German company's headquarters in Wolfsburg.

Sources close to the company say the meeting, due to start at 9 a.m local time (0700 GMT), is likely to last for hours, given the number and gravity of the issues to be discussed.

Europe's largest carmaker is under huge pressure to find those responsible, say how affected vehicles will be fixed and identify to what extent it may also have cheated in Europe.

The biggest business crisis in its 78-year history has wiped more than a third off Volkswagen's share price, forced out its long-time chief executive and sent shockwaves through both the global car industry and the German establishment.

On Tuesday, more than 20,000 workers gathered at the company's sprawling Wolfsburg plant to hear new CEO Matthias Mueller address them for the first time since he replaced Martin Winterkorn two weeks ago.

"We will overcome the crisis," Mueller told staff, many of them wearing specially printed t-shirts with the slogan "one team, one family" to show their support for the company.

Mueller warned all projects and investments would be put under review and there would be

"massive cuts".

But Volkswagen's ability to recover could also depend on what happens on two key dates this week: Germany's KBA watchdog has set a Wednesday deadline to submit a plan to make its cars compliant with emissions laws and the company's top U.S. executive is due to testify before a U.S. congressional oversight panel on Thursday.

CHEATING

Since Volkswagen's cheating was exposed on Sept. 18, the carmaker has come under fire for a slow response.

While it admitted on Sept. 22 that 11 million diesel vehicles worldwide were fitted with software capable of rigging emissions tests, it only provided customers with information about whether their vehicles were affected on Friday.

Owners have been told their cars and vans will have to be refitted, but do not know if this will affect their fuel economy or performance -- key issues that could determine the number of lawsuits and amount of damage to Volkswagen's reputation.

Analysts and investors are also anxious to know whether Volkswagen cheated emissions tests in Europe too. The German transport ministry has said it did, but has not given details.

Given 8 million of the 11 million affected vehicles are in the European Union, any cheating there could have a bigger impact than the United States in terms of fines and lawsuits.

"We need clarity on Europe," Bernstein analyst Max Wurburton wrote in a research note this week.

"If the issue is just limited to the U.S. ... then the financial consequences may be containable. But if VW also cheated in Europe, then the situation will become much graver."

WHO'S RESPONSIBLE?

Volkswagen's supervisory board will also be under pressure to come up with answers about who was responsible for installing the "cheat" software and concealing its usage.

The company has suspended more than 10 senior managers, including three top engineers. However, one source close to the supervisory board told Reuters on Monday the carmaker's internal inquiry had not found any evidence to accuse the top engineers of the manipulation.

Volkswagen has said its investigations, including an external one by U.S. law firm Jones Day, would take months.

But a panel of U.S. lawmakers will want answers when they question the company's U.S. boss Michael Horn on Thursday.

Two sources close to the board said Wednesday's meeting would look to provide Horn with detailed information and a timeline on the rigging of U.S. emissions tests.

CEO Mueller and an official from Jones Day will attend the supervisory board meeting, sources said.

RETURN OF PIECH

The rise of both Poetsch and Mueller signal a return to influence for Volkswagen's long-time

chairman Ferdinand Piech, who was ousted in April after he publicly criticised Winterkorn's performance.

Piech, a member of the Porsche-Piech clan that owns a controlling stake in the German carmaker, has supported both managers in their careers.

The 78-year-old, who considers Volkswagen his life's work, was likely to exert renewed influence under the new regime in areas such as brand management and model strategy, a source close to the matter said.

After keeping away from the company in the months after his ouster, Piech and his wife Ursula visited the Volkswagen stand at the Frankfurt auto show on Sept. 22, four days after the emissions scandal broke and the day before Winterkorn resigned.

Some analysts and investors have questioned Volkswagen's decision to appoint company insiders to top jobs in the wake of the scandal, saying hiring outsiders would underscore its commitment to change.

Shareholder advisory firm Hermes EOS said last week it had "real doubts" about whether Volkswagen's main stakeholders recognised the need for fundamental reform.

http://thehill.com/policy/transportation/255963-house-dems-press-for-volkswagen-emission-hearing

House Dems press for Volkswagen emission hearing

By Keith Laing

Democrats on the House Oversight and Government Reform Committee are pushing for a hearing to probe Volkswagen's circumvention of federal air pollution emission standards.

The Environmental Protection Agency (EPA) has accused the German automaker of selling about 482,000 vehicles since 2008 that violate the Clean Air Act due to software installed on the vehicles that activates required air pollution protections only during emissions tests.

Democrats on the House Oversight and Government Reform Committee's Transportation and Public Assets Subcommittee said Republicans on the GOP-led panel should convene a hearing to investigate Volkswagen's actions.

“Clearly, there appears to be a growing and pervasive disregard for consumer safety, public health, and environmental protections by some within the auto industry," the lawmakers wrote.

"By convening a hearing on the implications of deceptive practices within the auto industry, the committee can thoughtfully consider the negative consequences for U.S. taxpayers, auto workers, and federal regulatory agencies, and determine if adequate protections are in place to minimize or eliminate future occurrences,” the letter continued.

Volkswagen has been embroiled in scandal since the EPA revealed that the company programmed vehicles to trick emissions testers into believing that its diesel cars released a much lower volume of nitrogen oxide than they actually do.

A “defeat device” in the vehicles made it so they would pass emissions tests. But in regular driving, the vehicles emitted up to 40-times more pollution.

Volkswagen has admitted to the accusations.

The EPA has said Volkswagen could face up to an $18 billion fine for its pollution violations.

The lawmakers said in their letter about the Volkswagen allegations that "such malfeasance is completely unacceptable to the American consumer and is likely a violation of federal law."

The letter was signed by Reps. Mark DeSaulnier (D-Calif.), Bonnie Watson Coleman (D-N.J.) and Brendan Boyle (D-Calif.).

Volkswagen slashing costs that aren't 'absolutely vital' amid emissions scandal

Nathan Bomey, USA TODAY 9:18 a.m. EDT October 6, 2015

New Volkswagen CEO Matthias Mueller told employees at Volkswagen's headquarters in Germany that the company is reviewing its spending plans to conserve cash.

The gravity of Volkswagen's emissions scandal is sinking in as the automaker's new boss warned that the company is planning comprehensive cuts to navigate the costly crisis.

"We will review all planned investments, and what isn't absolutely vital will be canceled or delayed," Volkswagen CEO Matthias Mueller told workers at Volkswagen's headquarters in Wolfsburg, Germany. "And that's why we will re-adjust our efficiency program. I will be

completely clear: this won't be painless."

Mueller's comment — which was made in German and confirmed by an English speaking spokesman for this story — reflects the depth of the financial crisis Volkswagen is facing after it admitted to rigging 11 million diesel cars worldwide with software that allowed cars to cheat emissions regulations.

The cost cuts come amid swirling speculation over the ultimate price tag of the scandal, which is expected to be much higher than the $7 billion Volkswagen has already set aside.

In the U.S., where only 482,000 cars were fitted with the "defeat device" software, fines and the cost of vehicle buybacks could exceed 15 billion euros, or nearly $17 billion, Sanford C. Bernstein analyst Max Warburton said Monday in a research note. The company — which passed Toyota as the world's largest automaker for the first six months of 2015 — made a global operating profit of 12.7 billion euros in 2014.

Warburton posited that the scandal may not be as grave in Europe, where, he said, cars may be fitted with the cheating software yet still compliant with local emissions regulations. European standards on nitrogen oxide emissions — which can exacerbate respiratory conditions such as asthma — are not as stringent as U.S. standards.

Still, the financial ripple effects of the crisis are "potentially terrifying" if the scandal mushrooms in Europe, Warburton said. Industry observers have theorized it could reach the $30 billion range, although speculation varies widely.

It was not immediately clear how cost-cuts would affect Volkswagen's only U.S. factory in Chattanooga, Tenn. A U.S.-based spokeswoman did not respond to a request for information.

According to a copy of Mueller's prepared remarks, the CEO reiterated that "it is still not possible to quantify" how much the scandal will cost. But he vowed to ensure the company's survival and regain the public's trust.

"We can and we will overcome this crisis, because Volkswagen is a group with a strong foundation," He said. "And above all because we have the best automobile team anyone could wish for."

Mueller admitted, however, that he does not know the full extent of the scandal, which dates back to 2009 models and led to the resignation of his predecessor, Martin Winterkorn.

"Believe me — like you, I am impatient," he said.

Volkswagen is expected to propose fixes to regulators this month. Mueller said software updates will be enough for many vehicles, but others will require hardware upgrades.

In his remarks, Mueller signaled that the company won't reduce its commitment to new product development.

"We cannot afford to economize on the future," he said. "That is something else we will also be addressing over the coming weeks and months."

The automaker is facing a litany of investigations and lawsuits over the scandal, including a U.S. Justice Department criminal probe and numerous class-action suits filed by consumers. It has also ordered a outside law firm to conduct an investigation of its handling of the matter.

Washington Post:

http://www.washingtonpost.com/business/economy/the-epa-closed-the-lab-that-might-have-caught-vw-years-ago/2015/10/05/03487752-67b5-11e5-9223-70cb36460919_story.html

The EPA closed the lab that might have caught VW years ago

By Peter Whoriskey October 5 at 10:48 AM

More than 20 years ago, an engineer at the Environmental Protection Agency invented a device that allows technicians to measure the emissions of a car as it is traveling in the real world.

Had the device, then known as ROVER, been used by the EPA to screen cars, it would have detected Volkswagen's cheating long ago, former engineers for the EPA said.

But the Alexandria, Va., lab where the testing device was developed was closed by the EPA about 2001, and the contractors who worked there were laid off. The pilot program that used the new devices to test cars for emissions compliance on the road did not continue, officials said.

"When this all came out in the news about VW, my first thought was, 'Wow, we could have been all over this,' " said John Lux, testing manager at the lab.

"It's a coulda, shoulda, woulda situation," said another engineer from the lab who spoke on the condition of anonymity because he still does contract work with the government. The testing in Virginia "would have detected the Volkswagen issue immediately."

A missed opportunity?

The news that Volkswagen cheated on car emissions tests for eight years has led to criticism that the pollution checks performed by the EPA have been too passive.

Agency officials have defended their efforts and said that they will step up the scrutiny. They said the Virginia lab was closed because it was "outdated" and that its resources were better used at its larger testing facility in Ann Arbor, Mich.

But the closure of the Virginia Testing Laboratory suggests that they had the opportunity years ago to make emissions tests more comprehensive.

For years, the EPA has checked car emissions by running tests in a laboratory: the cars spinning their wheels on rollers, while scientists sample and analyze the exhaust.

But as Volkswagen engineers have illustrated, it's possible to cheat on such tests. In the Volkswagen case, the cars could detect when they were undergoing a lab test, and when they did, they reduced their emissions. Once out on the roads, those cars emitted as much as 10 times the legal limits of the pollutants known as nitrogen oxides.

It wasn't until an outside group, the International Council on Clean Transportation, decided to test the cars on the roads that the Volkswagen deception was uncovered.

Now many environmental groups and others are pushing for broad use of those road emissions tests invented in early 1995. The advocates of more road testing note that the Volkswagen deception began in 2008 and was detected almost accidentally — and not by the EPA.

Moreover, they argue, emissions violations are not new — Volkswagen is not alone. Other automakers and engine-makers have been caught in similar violations, though their transgressions involved far fewer cars. Volkwagen's involved about 11 million worldwide.

Among those pushing the government to conduct more road tests is the Center for Biological Diversity, an environmental group that filed a legal petition last week demanding that the EPA conduct real-world testing of all diesel cars going back to model year 2009.

"There's no good reason for EPA not to employ every method possible to detect fraud and protect public health and our climate," said Kristen Monsell, a lawyer for the group. "The Volkswagen debacle ought to be a wake-up call for the agency to make that happen."

Lab vs. real world

EPA officials disputed the idea that the real-world emissions tests, known as ROVER, would have detected the Volkswagen emissions trouble.

"The problem with such hypotheticals is that no one can know what would have happened in those cases," the EPA said in a statement.

For example, EPA officials said, the same Volkswagen engine software that defeated the lab tests might have been configured to defeat the road tests, too.

But experts said that would be improbable because a road test is unlikely to follow an easily detectable pattern. And without one, it may be close to impossible for a car to know it is being tested.

Indeed, several emissions experts, as well as the former chief of the EPA's emissions office, have said that the ROVER device would have detected the Volkswagen deception.

The idea for real-world testing arose out of an insight by Leo Breton, an engineer at the EPA during the '90s.

Breton's job was to oversee the lab testing of auto emissions carried out by a contractor at the Virginia Testing Laboratory. In the lab tests, cars are put on rollers, and test drivers accelerate and decelerate according to a set pattern, while the output is measured and analyzed.

"I kept wondering whether the emissions numbers being calculated during the lab tests had anything to do with reality," he said.

One of the reasons Breton was skeptical of the lab tests' accuracy is that he saw the test drivers

become experts on the test course. That expertise meant that they would step on the accelerator less often than drivers in the real world, and that, in turn, meant that the test cars would show lower emissions.

The test driver also "doesn't have to worry about traffic, or weather, or potholes," Breton said, so they drive very efficiently. "In the real world, a driver has to step on the gas a lot more."

The practical challenge he faced was this: How to measure emissions while a car is out on the road? Breton rigged a test apparatus, using a borrowed gas analyzer, to record emissions in the real world. It was improvised because he had no budget. During tests, they stashed the equipment in the back seat, connected a hose to the tailpipe, and set out to measure the pollutants.

It turned out that his suspicions were well founded. What the real-world tests showed is that there is a gap between lab tests and real-world tests of about 10 percent to 20 percent, generally.

Gaps of that magnitude were deemed normal. But the equipment also turned up cases where the gaps were much, much larger, and in some of those cases, the road tests were used to show that manufacturers were failing emissions standards.

The first time his device was put to official work, the EPA determined that Cadillacs were emitting three times the permitted amount of carbon monoxide whenever the car's air-conditioner was in use.

In 1997, it revealed problems with Ford Econoline vans, and in 1998, similar problems emerged at seven manufacturers of heavy-duty engines.

The engineers then started a pilot program to test more cars with ROVER, but about 2001, EPA officials closed the Virginia Testing Laboratory.

Chris Grundler, the head of the emissions office at the EPA, said the road tests were not regularly used to check diesel car compliance because, compared with trucks, they emit only a small fraction of the pollution.

That car testing "didn't continue because it didn't rise to the top of our priority scheme," he said.

'You have to do both'

Grundler said that he supports checking car emissions using both kinds of tests: those run in a lab, which are more accurate and predictable, as well as those done on the road, which offer the advantage of testing in real-world conditions.

"We're getting calls that the dynamometers [the lab tests] are obsolete — but that's just wrong," Grundler said. "The point is to do this work, you have to do both."

He noted that for years the EPA has been using the road tests to measure the emissions of heavy-duty engines.

Michael P. Walsh, a former EPA official who oversaw car pollution efforts during the 1970s and received a MacArthur Foundation "genius" grant in 2005, said he supports efforts to broaden the use of road tests to detect emissions discrepancies.

"We know we've been burned before, and there may have been other cases that we missed," Walsh said. "The way I would look at it is that the first priority is to check the largest sources of pollution — that would be trucks. But you would also do random testing of other engines just so that the industry knows that EPA is looking."

Subject: Audi A3 eTron Prep Wednesday

Hello Vince,

As you are probably aware – tomorrow is a busy day for VW at EPA (we have the Passat TDI running it's emissions tests, and also the prep run for the Audi A3 e-Tron).

Do we know when these tests will take place?

We are assuming for the TDI to be there at 7 a.m (unless we hear different), but our resident engineer for the A3 eTron was asking if we know what time the prep was going to run tomorrow. Any idea?

I know Arlene is gone, so I'm thinking we will just plan for 7 a.m in both cases.

Thanks Vince.

Regards,

Greg Allen

COMMITTEE ON ENERGY AND COMMERCE

2125 RAYBURN HOUSE OFFICE BUILDING
WASHINGTON, DC 20515–6115
Majority (202) 225–2927
Minority (202) 225–3641

October 2, 2015

The Honorable Gina McCarthy
Administrator
U.S. Environmental Protection Agency
1200 Pennsylvania Avenue, N.W.
Washington, DC 20460

Dear Administrator McCarthy:

Thank you for agreeing to have your designees testify on Thursday, October 8, 2015, at 10:00 a.m. in 2123 Rayburn House Office Building, at the Subcommittee on Oversight and Investigations hearing entitled "Volkswagen Emissions Cheating Allegations: Initial Questions."

The attached documents provide important details concerning the preparation and presentation of your testimony.

- The first attachment describes the form your testimony must take.
- The second attachment provides you with Electronic Format Guidelines that detail how to file testimony electronically.
- The third attachment provides you the Rules for the Committee on Energy and Commerce.
- The fourth attachment provides you with a Truth-in-Testimony Disclosure form and a Truth-in-Testimony instruction sheet.

Please be aware that, in accordance with the Committee's usual practice:

(1) Witnesses will be required to provide sworn testimony;

(2) Witnesses have a right to be represented by counsel, who may advise the witnesses on their Constitutional rights, but cannot testify. If appearing as a witness, the counsel will be sworn in; and,

(3) Hearings are open to audio, video, and photographic coverage by accredited press representatives only.

If you have any questions concerning any aspect of your testimony, please contact Peter Spencer or John Ohly of the Energy and Commerce Committee staff at (202) 225-2927.

Sincerely,

Tim Murphy
Chairman
Subcommittee on Oversight and Investigations

Enclosures: (1) Form of Testimony

THE FORM OF TESTIMONY
BEFORE THE COMMITTEE ON ENERGY AND COMMERCE

Written Statement: You are requested to submit a written statement, which may be of any reasonable length and may contain supplemental materials . H owever, please be aware that the Comm ittee cannot guarantee that supplemental material will be included in the printed hearing record. Your written statement should be typed, double spaced, and should include a one-page summary of the major points you wish to make.

Pursuant to Rule 3(c) o f the Rules of the Committee, please provide your written statement no later than two business days in advance of your appearance. This will allow Members and staff the opportunity to review your testimony.

Oral Presentation: You will have an opportunity to present an oral summary of your testimony to the Committee . T o ensure sufficient time for Members to ask questions, your oral presentation should be limited to 5 minutes.

Printed Hearing Transcript : Rule XI, clause 2(e)(1)(A) of the Rules of the House requires the Committee to keep a written record of committee hearings which is a substantially verbatim account of remarks made during the proceedings, subject only to technical, grammatical, and typographical corrections. Your testimony, th e transcript of the hearing, and any other material that the Committee agrees to include in the hearing record (subject to space limitations) will be printed as a record of the hearing.

GUIDELINES FOR THE ELECTRONIC SUBMISSION OF CONGRESSIONAL TESTIMONY

The Rules and procedures of the Energy and Commerce Committee require each witness to submit their testimony in an electronic format prescribed by the Chairman. Testimony submitted in electronic form will be used to produce the printed hearing record, and will be converted to HTML or Adobe Portable Document Format (PDF) and posted to the Committee on Energy and Commerce website at http://energycommerce.house.gov/. Your compliance with this requirement will facilitate the distribution of your testimony and help the Committee to minimize the costs of printing the hearing record.

Materials submitted to the Committee must be formatted in Microsoft Word.

Please e-mail your testimony to the Legislative Clerk at Greg.Watson@mail.house.gov. In addition, please include the following in the body of your e-mail: (1) Witness Name, (2) Witness Organization, (3) Name and Date of Hearing, and (4) Subcommittee of Jurisdiction.

The Committee cannot accept testimony submitted on a disk or flash drive.

RULES OF THE COMMITTEE ON ENERGY AND COMMERCE
114TH CONGRESS

(Adopted January 14, 2015)

RULE 1. GENERAL PROVISIONS

(a) Rules of the Committee. The Rules of the House are the rules of the Committee on Energy and Commerce (the "Committee") and its subcommittees so far as is applicable.

(b) Rules of the Subcommittees. Each subcommittee of the Committee is part of the Committee and is subject to the authority and direction of the Committee and to its rules so far as is applicable. Written rules adopted by the Committee, not inconsistent with the Rules of the House, shall be binding on each subcommittee of the Committee.

RULE 2. MEETINGS

(a) Regular Meeting Days. The Committee shall meet on the fourth Tuesday of each month at 10 a.m., for the consideration of bills, resolutions, and other business, if the House is in session on that day. If the House is not in session on that day and the Committee has not met during such month, the Committee shall meet at the earliest practicable opportunity when the House is again in session. The chairman of the Committee may, at his discretion, cancel, delay, or defer any meeting required under this section, after consultation with the ranking minority member.

(b) Additional Meetings. The chairman may call and convene, as he considers necessary, additional meetings of the Committee for the consideration of any bill or resolution pending before the Committee or for the conduct of other Committee business. The Committee shall meet for such purposes pursuant to that call of the chairman.

(c) Notice. The date, time, place, and subject matter of any meeting of the Committee scheduled on a Tuesday, Wednesday, or Thursday when the House will be in session shall be announced at least 36 hours (exclusive of Saturdays, Sundays, and legal holidays except when the House is in session on such days) in advance of the commencement of such meeting. The date, time, place, and subject matter of other meetings when the House is in session shall be announced to allow

Members to have at least three days notice (exclusive of Saturdays, Sundays, and legal holidays except when the House is in session on such days) of such meeting. The date, time, place, and subject matter of all other meetings shall be announced at least 72 hours in advance of the commencement of such meeting.

(d) Agenda. The agenda for each Committee meeting, setting out all items of business to be considered, shall be provided to each member of the Committee at least 36 hours in advance of such meeting.

(e) Availability of Texts. No bill, recommendation, or other matter shall be considered by the Committee unless the text of the matter, together with an explanation, has been available to members of the Committee for three days (or 24 hours in the case of a substitute for introduced legislation). Such explanation shall include a summary of the major provisions of the legislation, an explanation of the relationship of the matter to present law, and a summary of the need for the legislation.

(f) Waiver. The requirements of subsections (c), (d), and (e) may be waived by a majority of those present and voting (a majority being present) of the Committee or by the chairman with the concurrence of the ranking member, as the case may be.

RULE 3. HEARINGS

(a) Notice. The date, time, place, and subject matter of any hearing of the Committee shall be announced at least one week in advance of the commencement of such hearing, unless a determination is made in accordance with clause 2(g)(3) of Rule XI of the Rules of the House that there is good cause to begin the hearing sooner.

(b) Memorandum. Each member of the Committee shall be provided, except in the case of unusual circumstances, with a memorandum at least 48 hours before each hearing explaining (1) the purpose of the hearing and (2) the names of any witnesses.

(c) Witnesses. (1) Each witness who is to appear before the Committee shall file with the clerk of the Committee, at least two working days in advance of his or her appearance, sufficient copies, as determined by the chairman of the Committee of a written statement of his or her proposed testimony to provide to members and staff of the Committee, the news media, and the general public. Each witness shall, to the greatest extent practicable, also provide a copy of such written testimony in an

VW FOIA, EPA 06/20/2017 2017-FFP_029370

electronic format prescribed by the chairman. Each witness shall limit his or her oral presentation to a brief summary of the argument. The chairman of the Committee or the presiding member may waive the requirements of this paragraph or any part thereof.

(2) To the greatest extent practicable, the written testimony of each witness appearing in a nongovernmental capacity shall include a curriculum vitae and a disclosure of any federal grant or contract or foreign government contracts and payments related to the subject matter of the hearing received during the current calendar year or either of the two preceding calendar years by the witness or by an entity represented by the witness. The disclosure shall include (i) the amount and source of each Federal grant (or subgrant thereof) or contract (or subcontract thereof) related to the subject matter of the hearing; and (ii) the amount and country of origin of any payment or contract related to the subject matter of the hearing originating with a foreign government.

(d) Questioning. (1) The right to interrogate the witnesses before the Committee shall alternate between majority and minority members. Each member shall be limited to 5 minutes in the interrogation of witnesses until such time as each member who so desires has had an opportunity to question witnesses. No member shall be recognized for a second period of 5 minutes to interrogate a witness until each member of the Committee present has been recognized once for that purpose. The chairman shall recognize in order of appearance members who were not present when the meeting was called to order after all members who were present when the meeting was called to order have been recognized in the order of seniority on the Committee.

(2) The chairman, with the concurrence of the ranking minority member, or the Committee by motion, may permit an equal number of majority and minority members to question a witness for a specified, total period that is equal for each side and not longer than thirty minutes for each side. The chairman with the concurrence of the ranking minority member, or the Committee by motion, may also permit committee staff of the majority and minority to question a witness for a specified, total period that is equal for each side and not longer than thirty minutes for each side.

(3) Each member may submit to the chairman of the Committee additional questions for the record, to be answered by the witnesses who have appeared. Each member shall provide a copy of the questions in an electronic format to the clerk of the Committee no later than ten business days following a hearing. The chairman

VW FOIA, EPA 06/20/2017 2017-FFP_029371

shall transmit all questions received from members of the Committee to the appropriate witness and include the transmittal letter and the responses from the witnesses in the hearing record. After consultation with the ranking minority member, the chairman is authorized to close the hearing record no earlier than 120 days from the date the questions were transmitted to the appropriate witness.

RULE 4. VICE CHAIRMEN; PRESIDING MEMBER

The chairman shall designate a member of the majority party to serve as vice chairman of the Committee, and shall designate a majority member of each subcommittee to serve as vice chairman of each subcommittee. The vice chairman of the Committee or subcommittee, as the case may be, shall preside at any meeting or hearing during the temporary absence of the chairman. If the chairman and vice chairman of the Committee or subcommittee are not present at any meeting or hearing, the ranking member of the majority party who is present shall preside at the meeting or hearing.

RULE 5. OPEN PROCEEDINGS

Except as provided by the Rules of the House, each meeting and hearing of the Committee for the transaction of business, including the markup of legislation, and each hearing, shall be open to the public, including to radio, television, and still photography coverage, consistent with the provisions of Rule XI of the Rules of the House.

RULE 6. QUORUM

Testimony may be taken and evidence received at any hearing at which there are present not fewer than two members of the Committee in question. A majority of the members of the Committee shall constitute a quorum for those actions for which the House Rules require a majority quorum. For the purposes of taking any other action, one-third of the members of the Committee shall constitute a quorum.

RULE 7. OFFICIAL COMMITTEE RECORDS

(a)(1) Journal. The proceedings of the Committee shall be recorded in a journal which shall, among other things, show those present at each meeting, and include a record of the vote on any question on which a record vote is demanded and a description of the amendment, motion, order, or other proposition voted. A copy of the journal shall be furnished to the ranking minority member.

VW FOIA, EPA 06/20/2017 2017-FFP_029372

(2) Record Votes. A record vote may be demanded by one-fifth of the members present or, in the apparent absence of a quorum, by any one member. No demand for a record vote shall be made or obtained except for the purpose of procuring a record vote or in the apparent absence of a quorum. The result of each record vote in any meeting of the Committee shall be made publicly available in electronic form on the Committee's website and in the Committee office for inspection by the public, as provided in Rule XI, clause 2(e) of the Rules of the House, within 24 hours. Such result shall include a description of the amendment, motion, order, or other proposition, the name of each member voting for and each member voting against such amendment, motion, order, or proposition, and the names of those members of the committee present but not voting. The chairman, with the concurrence of the ranking minority member, may from time to time postpone record votes ordered on amendments to be held at a time certain during the consideration of legislation.

(b) Archived Records. The records of the Committee at the National Archives and Records Administration shall be made available for public use in accordance with Rule VII of the Rules of the House. The chairman shall notify the ranking minority member of any decision, pursuant to clause 3 (b)(3) or clause 4 (b) of the Rule, to withhold a record otherwise available, and the matter shall be presented to the Committee for a determination on the written request of any member of the Committee. The chairman shall consult with the ranking minority member on any communication from the Archivist of the United States or the Clerk of the House concerning the disposition of noncurrent records pursuant to clause 3(b) of the Rule.

RULE 8. SUBCOMMITTEES

(a) Establishment. There shall be such standing subcommittees with such jurisdiction and size as determined by the majority party caucus of the Committee. The jurisdiction, number, and size of the subcommittees shall be determined by the majority party caucus prior to the start of the process for establishing subcommittee chairmanships and assignments.

(b) Powers and Duties. Each subcommittee is authorized to meet, hold hearings, receive testimony, mark up legislation, and report to the Committee on all matters referred to it. Subcommittee chairmen shall set hearing and meeting dates only with the approval of the chairman of the Committee with a view toward assuring the availability of meeting rooms and avoiding simultaneous scheduling of

VW FOIA, EPA 06/20/2017 2017-FFP_029373

Committee and subcommittee meetings or hearings whenever possible.

(c) Ratio of Subcommittees. The majority caucus of the Committee shall determine an appropriate ratio of majority to minority party members for each subcommittee and the chairman shall negotiate that ratio with the minority party, provided that the ratio of party members on each subcommittee shall be no less favorable to the majority than that of the full Committee, nor shall such ratio provide for a majority of less than two majority members.

(d) Selection of Subcommittee Members. Prior to any organizational meeting held by the Committee, the majority and minority caucuses shall select their respective members of the standing subcommittees.

(e) Ex Officio Members. The chairman and ranking minority member of the Committee shall be ex officio members with voting privileges of each subcommittee of which they are not assigned as members and may be counted for purposes of establishing a quorum in such subcommittees.

RULE 9. OPENING STATEMENTS

(a) Written Statements. All written opening statements at hearings and business meetings conducted by the committee shall be made part of the permanent record.

(b) Length. (1) At full committee hearings, the chairman and ranking minority member shall be limited to 5 minutes each for an opening statement, and may designate another member to give an opening statement of not more than 5 minutes. At subcommittee hearings, the subcommittee chairman and ranking minority member of the subcommittee shall be limited to 5 minutes each for an opening statement. In addition, the full committee chairman and ranking minority member shall each be allocated 5 minutes for an opening statement for themselves or their designees.

(2) At any business meeting of the Committee, statements shall be limited to 5 minutes each for the chairman and ranking minority member (or their respective designee) of the Committee or subcommittee, as applicable, and 3 minutes each for all other members. The chairman may further limit opening statements for Members (including, at the discretion of the Chairman, the chairman and ranking minority member) to one minute.

VW FOIA, EPA 06/20/2017 2017-FFP_029374

RULE 10. REFERENCE OF LEGISLATION AND OTHER MATTERS

All legislation and other matters referred to the Committee shall be referred to the subcommittee of appropriate jurisdiction within two weeks of the date of receipt by the Committee unless action is taken by the full Committee within those two weeks, or by majority vote of the members of the Committee, consideration is to be by the full Committee. In the case of legislation or other matter within the jurisdiction of more than one subcommittee, the chairman of the Committee may, in his discretion, refer the matter simultaneously to two or more subcommittees for concurrent consideration, or may designate a subcommittee of primary jurisdiction and also refer the matter to one or more additional subcommittees for consideration in sequence (subject to appropriate time limitations), either on its initial referral or after the matter has been reported by the subcommittee of primary jurisdiction. Such authority shall include the authority to refer such legislation or matter to an ad hoc subcommittee appointed by the chairman, with the approval of the Committee, from the members of the subcommittees having legislative or oversight jurisdiction.

RULE 11. MANAGING LEGISLATION ON THE HOUSE FLOOR

The chairman, in his discretion, shall designate which member shall manage legislation reported by the Committee to the House.

RULE 12. COMMITTEE PROFESSIONAL AND CLERICAL STAFF APPOINTMENTS

(a) Delegation of Staff. Whenever the chairman of the Committee determines that any professional staff member appointed pursuant to the provisions of clause 9 of Rule X of the House of Representatives, who is assigned to such chairman and not to the ranking minority member, by reason of such professional staff member's expertise or qualifications will be of assistance to one or more subcommittees in carrying out their assigned responsibilities, he may delegate such member to such subcommittees for such purpose. A delegation of a member of the professional staff pursuant to this subsection shall be made after consultation with subcommittee chairmen and with the approval of the subcommittee chairman or chairmen involved.

(b) Minority Professional Staff. Professional staff members appointed pursuant to clause 9 of Rule X of the House of Representatives, who are assigned to the ranking minority member of the Committee and not to the chairman of the

VW FOIA, EPA 06/20/2017 2017-FFP_029375

Committee, shall be assigned to such Committee business as the minority party members of the Committee consider advisable.

(c) Additional Staff Appointments. In addition to the professional staff appointed pursuant to clause 9 of Rule X of the House of Representatives, the chairman of the Committee shall be entitled to make such appointments to the professional and clerical staff of the Committee as may be provided within the budget approved for such purposes by the Committee. Such appointee shall be assigned to such business of the full Committee as the chairman of the Committee considers advisable.

(d) Sufficient Staff. The chairman shall ensure that sufficient staff is made available to each subcommittee to carry out its responsibilities under the rules of the Committee.

(e) Fair Treatment of Minority Members in Appointment of Committee Staff. The chairman shall ensure that the minority members of the Committee are treated fairly in appointment of Committee staff.

(f) Contracts for Temporary or Intermittent Services. Any contract for the temporary services or intermittent service of individual consultants or organizations to make studies or advise the Committee or its subcommittees with respect to any matter within their jurisdiction shall be deemed to have been approved by a majority of the members of the Committee if approved by the chairman and ranking minority member of the Committee. Such approval shall not be deemed to have been given if at least one-third of the members of the Committee request in writing that the Committee formally act on such a contract, if the request is made within 10 days after the latest date on which such chairman or chairmen, and such ranking minority member or members, approve such contract.

VW FOIA, EPA 06/20/2017 2017-FFP_029376

RULE 13. SUPERVISION, DUTIES OF STAFF

(a) Supervision of Majority Staff. The professional and clerical staff of the Committee not assigned to the minority shall be under the supervision and direction of the chairman who, in consultation with the chairmen of the subcommittees, shall establish and assign the duties and responsibilities of such staff members and delegate such authority as he determines appropriate.

(b) Supervision of Minority Staff. The professional and clerical staff assigned to the minority shall be under the supervision and direction of the minority members of the Committee, who may delegate such authority as they determine appropriate.

RULE 14. COMMITTEE BUDGET

(a) Administration of Committee Budget. The chairman of the Committee, in consultation with the ranking minority member, shall for the 114th Congress attempt to ensure that the Committee receives necessary amounts for professional and clerical staff, travel, investigations, equipment and miscellaneous expenses of the Committee and the subcommittees, which shall be adequate to fully discharge the Committee's responsibilities for legislation and oversight.

(b) Monthly Expenditures Report. Committee members shall be furnished a copy of each monthly report, prepared by the chairman for the Committee on House Administration, which shows expenditures made during the reporting period and cumulative for the year by the Committee and subcommittees, anticipated expenditures for the projected Committee program, and detailed information on travel.

RULE 15. BROADCASTING OF COMMITTEE HEARINGS

Any meeting or hearing that is open to the public may be covered in whole or in part by radio or television or still photography, subject to the requirements of clause 4 of Rule XI of the Rules of the House. The coverage of any hearing or other proceeding of the Committee or any subcommittee thereof by television, radio, or still photography shall be under the direct supervision of the chairman of the Committee, the subcommittee chairman, or other member of the Committee presiding at such hearing or other proceeding and may be terminated by such member in accordance with the Rules of the House.

VW FOIA, EPA 06/20/2017 2017-FFP_029377

RULE 16. SUBPOENA POWER

The power to authorize and issue subpoenas is delegated to the Chair of the full Committee, as provided for under clause 2(m)(3)(A)(i) of Rule XI of the Rules of the House of Representatives. The Chair shall notify the ranking minority member prior to issuing any subpoena under such authority. To the extent practicable, the Chair shall consult with the ranking minority member at least 72 hours in advance of a subpoena being issued under such authority. The chairman shall report to the members of the Committee on the issuance of a subpoena as soon as practicable but in no event later than one week after issuance of such subpoena.

RULE 17. TRAVEL OF MEMBERS AND STAFF

(a) Approval of Travel. Consistent with the primary expense resolution and such additional expense resolutions as may have been approved, travel to be reimbursed from funds set aside for the Committee for any member or any staff member shall be paid only upon the prior authorization of the chairman. Travel may be authorized by the chairman for any member and any staff member in connection with the attendance of hearings conducted by the Committee or any subcommittee thereof and meetings, conferences, and investigations which involve activities or subject matter under the general jurisdiction of the Committee. Before such authorization is given there shall be submitted to the chairman in writing the following: (1) the purpose of the travel; (2) the dates during which the travel is to be made and the date or dates of the event for which the travel is being made; (3) the location of the event for which the travel is to be made; and (4) the names of members and staff seeking authorization.

(b) Approval of Travel by Minority Members and Staff. In the case of travel by minority party members and minority party professional staff for the purpose set out in (a), the prior approval, not only of the chairman but also of the ranking minority member, shall be required. Such prior authorization shall be given by the chairman only upon the representation by the ranking minority member in writing setting forth those items enumerated in (1), (2), (3), and (4) of paragraph (a).

RULE 18. WEBSITE

The chairman shall maintain an official Committee website for the purposes of furthering the Committee's legislative and oversight responsibilities, including communicating information about the Committee's activities to Committee members and other members of the House. The ranking minority member may

VW FOIA, EPA 06/20/2017 2017-FFP_029378

maintain an official website for the purpose of carrying out official responsibilities, including communicating information about the activities of the minority members of the Committee to Committee members and other members of the House.

RULE 19. CONFERENCES

The chairman of the Committee is directed to offer a motion under clause 1 of Rule XXII of the Rules of the House whenever the chairman considers it appropriate.

Committee on Energy and Commerce
U.S. House of Representatives

Witness Disclosure Requirement - "Truth in Testimony"
Required by House Rule XI, Clause 2(g)(5)

1. Your Name:		
2. Your Title:		
3. The Entity(ies) You are Representing:		
4. Are you testifying on behalf of the Federal, or a State or local government entity?	**Yes**	**No**
5. Please list any Federal grants or contracts, or contracts or payments originating with a foreign government, that you or the entity(ies) you represent have received on or after January 1, 2013. Only grants, contracts, or payments related to the subject matter of the hearing must be listed.		
6. Please attach your curriculum vitae to your completed disclosure form.		

Signature:_____ **Date:**_____

INSTRUCTIONS FOR COMPLETING THE TRUTH-IN-TESTIMONY DISCLOSURE FORM

In General. The attached form is intended to assist witnesses appearing before the Committee on Energy and Commerce in complying with Rule XI, clause 2(g)(5) of the Rules of the House of Representatives, which provides:

> (B) In the case of a witness appearing in a nongovernmental capacity, a written statement of proposed testimony shall include a curriculum vitae and a disclosure of any Federal grants or contracts, or contracts or payments originating with a foreign government, received during the current calendar year or either of the two previous calendar years by the witness or by an entity represented by the witness and related to the subject matter of the hearing. (C) The disclosure referred to in subdivision (B) shall include (i) the amount and source of each Federal grant (or subgrant thereof) or contract (or subcontract thereof) related to the subject matter of the hearing; and (ii) the amount and country of origin of any payment or contract related to the subject matter of the hearing originating with a foreign government. (D) Such statements, with appropriate redactions to protect the privacy or security of the witness, shall be made publicly available in electronic form not later than one day after the witness appears.

Please complete the form in accordance with these directions.

1. ***Name, Title, Entity(ies) (Items 1-3 on the form).*** Please provide the name and title of the witness and the entity(ies) on whose behalf the witness is testifying.

2. ***Governmental Entity (Item 4).*** Please check the box indicating whether or not the witness is testifying on behalf of a government entity, such as a Federal department or agency, or a State or local department, agency, or jurisdiction. Trade or professional associations of public officials are not considered to be governmental organizations.

Grants and Contracts (Item 5). Please list any Federal grants or contracts, or contracts or payments originating with a foreign government, that you or the entity(ies) you represent have received on or after January 1, 2013. For each Federal grant (or subgrant thereof) or contract (or subcontract thereof) related to the subject matter of the hearing, please include the amount and source of each. For each payment or contract originating with a foreign government related to the subject matter of the hearing, please include the amount and country of origin of each. Only grants, contracts, or payments related to the subject matter of the hearing must be listed.

3. ***Curriculum Vitae (Item 6).*** Please attach your CV to your completed disclosure form.

4. ***Submission.*** Please sign and date the form in the appropriate place. Please submit this form with your written testimony. Please note that under the Committee's rules, copies of a written statement of your proposed testimony must be submitted before the commencement of the hearing. To the greatest extent practicable, please also provide a

copy in electronic format according to the Electronic Format Guidelines that accompany these instructions.

FRED UPTON, MICHIGAN
CHAIRMAN

FRANK PALLONE, JR., NEW JERSEY
RANKING MEMBER

ONE HUNDRED FOURTEENTH CONGRESS

Congress of the United States

House of Representatives

COMMITTEE ON ENERGY AND COMMERCE
2125 RAYBURN HOUSE OFFICE BUILDING
WASHINGTON, DC 20515–6115
Majority (202) 225–2927
Minority (202) 225–3641

October 2, 2015

The Honorable Gina McCarthy
Administrator
U.S. Environmental Protection Agency
1200 Pennsylvania Avenue, N.W.
Washington, DC 20460

Dear Administrator McCarthy:

Thank you for agreeing to have your designees testify on Thursday, October 8, 2015, at 10:00 a.m. in 2123 Rayburn House Office Building, at the Subcommittee on Oversight and Investigations hearing entitled "Volkswagen Emissions Cheating Allegations: Initial Questions."

The attached documents provide important details concerning the preparation and presentation of your testimony.

- The first attachment describes the form your testimony must take.
- The second attachment provides you with Electronic Format Guidelines that detail how to file testimony electronically.
- The third attachment provides you the Rules for the Committee on Energy and Commerce.
- The fourth attachment provides you with a Truth-in-Testimony Disclosure form and a Truth-in-Testimony instruction sheet.

Please be aware that, in accordance with the Committee's usual practice:

(1) Witnesses will be required to provide sworn testimony;

(2) Witnesses have a right to be represented by counsel, who may advise the witnesses on their Constitutional rights, but cannot testify. If appearing as a witness, the counsel will be sworn in; and,

(3) Hearings are open to audio, video, and photographic coverage by accredited press representatives only.

If you have any questions concerning any aspect of your testimony, please contact Peter Spencer or John Ohly of the Energy and Commerce Committee staff at (202) 225-2927.

Sincerely,

Tim Murphy
Chairman
Subcommittee on Oversight and Investigations

THE FORM OF TESTIMONY
BEFORE THE COMMITTEE ON ENERGY AND COMMERCE

Written Statement: You are requested to submit a written statement, which may be of any reasonable length and may contain supplemental materials . H owever, please be aware that the Comm ittee cannot guarantee that supplemental material will be included in the printed hearing record. Your written statement should be typed, double spaced, and should include a one-page summary of the major points you wish to make.

Pursuant to Rule 3(c) o f the Rules of the Committee, please provide your written statement no later than two business days in advance of your appearance. This will allow Members and staff the opportunity to review your testimony.

Oral Presentation: You will have an opportunity to present an oral summary of your testimony to the Committee . T o ensure sufficient time for Members to ask questions, your oral presentation should be limited to 5 minutes.

Printed Hearing Transcript : Rule XI, clause 2(e)(1)(A) of the Rules of the House requires the Committee to keep a written record of committee hearings which is a substantially verbatim account of remarks made during the proceedings, subject only to technical, grammatical, and typographical corrections. Your testimony, th e transcript of the hearing, and any other material that the Committee agrees to include in the hearing record (subject to space limitations) will be printed as a record of the hearing.

GUIDELINES FOR THE ELECTRONIC SUBMISSION OF CONGRESSIONAL TESTIMONY

The Rules and procedures of the Energy and Commerce Committee require each witness to submit their testimony in an electronic format prescribed by the Chairman. Testimony submitted in electronic form will be used to produce the printed hearing record, and will be converted to HTML or Adobe Portable Document Format (PDF) and posted to the Committee on Energy and Commerce website at http://energycommerce.house.gov/. Your compliance with this requirement will facilitate the distribution of your testimony and help the Committee to minimize the costs of printing the hearing record.

Materials submitted to the Committee must be formatted in Microsoft Word.

Please e-mail your testimony to the Legislative Clerk at Greg.Watson@mail.house.gov. In addition, please include the following in the body of your e-mail: (1) Witness Name, (2) Witness Organization, (3) Name and Date of Hearing, and (4) Subcommittee of Jurisdiction.

The Committee cannot accept testimony submitted on a disk or flash drive.

RULES OF THE COMMITTEE ON ENERGY AND COMMERCE
114TH CONGRESS

(Adopted January 14, 2015)

RULE 1. GENERAL PROVISIONS

(a) Rules of the Committee. The Rules of the House are the rules of the Committee on Energy and Commerce (the "Committee") and its subcommittees so far as is applicable.

(b) Rules of the Subcommittees. Each subcommittee of the Committee is part of the Committee and is subject to the authority and direction of the Committee and to its rules so far as is applicable. Written rules adopted by the Committee, not inconsistent with the Rules of the House, shall be binding on each subcommittee of the Committee.

RULE 2. MEETINGS

(a) Regular Meeting Days. The Committee shall meet on the fourth Tuesday of each month at 10 a.m., for the consideration of bills, resolutions, and other business, if the House is in session on that day. If the House is not in session on that day and the Committee has not met during such month, the Committee shall meet at the earliest practicable opportunity when the House is again in session. The chairman of the Committee may, at his discretion, cancel, delay, or defer any meeting required under this section, after consultation with the ranking minority member.

(b) Additional Meetings. The chairman may call and convene, as he considers necessary, additional meetings of the Committee for the consideration of any bill or resolution pending before the Committee or for the conduct of other Committee business. The Committee shall meet for such purposes pursuant to that call of the chairman.

(c) Notice. The date, time, place, and subject matter of any meeting of the Committee scheduled on a Tuesday, Wednesday, or Thursday when the House will be in session shall be announced at least 36 hours (exclusive of Saturdays, Sundays, and legal holidays except when the House is in session on such days) in advance of the commencement of such meeting. The date, time, place, and subject matter of other meetings when the House is in session shall be announced to allow

Members to have at least three days notice (exclusive of Saturdays, Sundays, and legal holidays except when the House is in session on such days) of such meeting. The date, time, place, and subject matter of all other meetings shall be announced at least 72 hours in advance of the commencement of such meeting.

(d) Agenda. The agenda for each Committee meeting, setting out all items of business to be considered, shall be provided to each member of the Committee at least 36 hours in advance of such meeting.

(e) Availability of Texts. No bill, recommendation, or other matter shall be considered by the Committee unless the text of the matter, together with an explanation, has been available to members of the Committee for three days (or 24 hours in the case of a substitute for introduced legislation). Such explanation shall include a summary of the major provisions of the legislation, an explanation of the relationship of the matter to present law, and a summary of the need for the legislation.

(f) Waiver. The requirements of subsections (c), (d), and (e) may be waived by a majority of those present and voting (a majority being present) of the Committee or by the chairman with the concurrence of the ranking member, as the case may be.

RULE 3. HEARINGS

(a) Notice. The date, time, place, and subject matter of any hearing of the Committee shall be announced at least one week in advance of the commencement of such hearing, unless a determination is made in accordance with clause 2(g)(3) of Rule XI of the Rules of the House that there is good cause to begin the hearing sooner.

(b) Memorandum. Each member of the Committee shall be provided, except in the case of unusual circumstances, with a memorandum at least 48 hours before each hearing explaining (1) the purpose of the hearing and (2) the names of any witnesses.

(c) Witnesses. (1) Each witness who is to appear before the Committee shall file with the clerk of the Committee, at least two working days in advance of his or her appearance, sufficient copies, as determined by the chairman of the Committee of a written statement of his or her proposed testimony to provide to members and staff of the Committee, the news media, and the general public. Each witness shall, to the greatest extent practicable, also provide a copy of such written testimony in an

VW FOIA, EPA 06/20/2017 2017-FFP_029391

electronic format prescribed by the chairman. Each witness shall limit his or her oral presentation to a brief summary of the argument. The chairman of the Committee or the presiding member may waive the requirements of this paragraph or any part thereof.

(2) To the greatest extent practicable, the written testimony of each witness appearing in a nongovernmental capacity shall include a curriculum vitae and a disclosure of any federal grant or contract or foreign government contracts and payments related to the subject matter of the hearing received during the current calendar year or either of the two preceding calendar years by the witness or by an entity represented by the witness. The disclosure shall include (i) the amount and source of each Federal grant (or subgrant thereof) or contract (or subcontract thereof) related to the subject matter of the hearing; and (ii) the amount and country of origin of any payment or contract related to the subject matter of the hearing originating with a foreign government.

(d) Questioning. (1) The right to interrogate the witnesses before the Committee shall alternate between majority and minority members. Each member shall be limited to 5 minutes in the interrogation of witnesses until such time as each member who so desires has had an opportunity to question witnesses. No member shall be recognized for a second period of 5 minutes to interrogate a witness until each member of the Committee present has been recognized once for that purpose. The chairman shall recognize in order of appearance members who were not present when the meeting was called to order after all members who were present when the meeting was called to order have been recognized in the order of seniority on the Committee.

(2) The chairman, with the concurrence of the ranking minority member, or the Committee by motion, may permit an equal number of majority and minority members to question a witness for a specified, total period that is equal for each side and not longer than thirty minutes for each side. The chairman with the concurrence of the ranking minority member, or the Committee by motion, may also permit committee staff of the majority and minority to question a witness for a specified, total period that is equal for each side and not longer than thirty minutes for each side.

(3) Each member may submit to the chairman of the Committee additional questions for the record, to be answered by the witnesses who have appeared. Each member shall provide a copy of the questions in an electronic format to the clerk of the Committee no later than ten business days following a hearing. The chairman
